

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE. ---

IN the treatment of so eventful a year as 1898 the difficulty of compression into the compass of a single volume is very great. Were the volume given up to political affairs alone, it would still be hard to keep within bounds in treating of a year which has seen the downfall of Spain's colonial empire, the British conquest of the Soudan, the threatened clash of two great powers in Africa, the initial steps in the partition of China, the progress of one great railway project for opening up Asia and the development of another for spanning the entire African continent, the evacuation of Crete and of Greece, and the proposal of a peace conference by the very power whose attitude had hitherto seemed the most menacing. Selection is equally difficult in many other departments. The year has been a striking one in almost all lines of activity—in scientific discoveries and inventions, in literature and art, in industrial and commercial progress. In the department of biography the new names requiring notice in connection with important events of the year are very numerous; many persons already well known have added to their records; and the death roll includes such renowned names as Gladstone and Bismarck.

A brief survey of the most important events and lines of progress is the object of the present volume. The aim has been to arrange the subject-matter so far as possible in cyclopædic form, in order that the volume may serve not only as a Year Book, but as a supplement to, or continuation of, the principal cyclopædias. With this in view, the various topics have generally been treated under their own titles rather than grouped under more general heads, and the necessity of an index has been avoided. Single long articles, however, have been included on such subjects as Archæology, Anthropology, Botany, Philology, Physics, Astronomy, and Psychology, because in each of these cases the year's progress could be best exhibited by treating the subject as a whole; but wherever this has been done, care has been taken to supply cross-references from particular topics to the paragraphs of the longer articles in which they are treated. In general, wherever it seemed that the reader would more naturally turn to the particular topic than to the general subject of which it is a part, the article has been included under that title. Thus in the department of Medicine, such subjects as Serum Therapy, Typhoid Fever, Epidemic Influenza, Yellow Fever, Plague, etc., are treated under their own titles, and not as parts of a single long article on Medicine; and in the departments of Civil, Electrical and Mechanical Engineering, articles on Bridges, Canals, Automobiles, Electric Railways, Waterworks, Sewage Purification, etc., occur under those titles. This topical arrangement has also been found the most suitable in the departments of Geology, Mineralogy, Metallurgy, Biology, Zoology, Chemistry, and others, and it

is believed that as a result of this somewhat elastic arrangement the person who consults the volume will find the topics treated under the titles to which he would naturally turn first. The information in regard to universities and colleges, being almost wholly statistical in character, has been presented in an alphabetical table, under the title of Universities and Colleges, a comparatively small number of institutions being treated in separate articles. By this arrangement greater facility of reference has been secured, than if each college or university were treated by itself.

Another object which the authors of this volume have had in view has been to reflect the current discussion of the topics treated instead of giving a bare catalogue of events. Such discussion is as truly a part of the history of the year as the events themselves, and although the historical interpretation of events must be postponed for many years after their occurrence, a record of current opinion upon them has interest and value. For that reason, in treating such political topics as the colonial policy of the United States, the Fashoda affair, the Dreyfus case, the partition of China, the Behring Sea Dispute, the annexation of Hawaii, Currency Reform, the Nicaragua Canal, etc., and other matters which, like Hypnotism, Spiritualism, Christian Science, etc., have occasioned controversy, the purpose has been to present a fair statement of opposing views.

A work intended to fulfil the double office of a Year Book and a Cyclopædia appendix must necessarily include many lines of statistics, for no other department of a reference book falls so quickly behind the times. It is, perhaps, unnecessary to explain the inclusion of statistics in certain cases for years previous to 1898, since it is well known that many classes of statistics are not issued until long after the period of time to which they relate. It has been the aim of the editors in every case to include the latest figures which were available at the time of writing.

It will be noted in certain articles that the account of the year is preceded by a review of earlier aspects of the subject. In such cases it was thought that the reader would be spared some inconvenience if the article were made fairly complete in itself, instead of beginning abruptly with the year's record, without explanation or introduction.

THE INTERNATIONAL YEAR BOOK 1898

ABBOTT, LYMAN, D. D., pastor of Plymouth Church, Brooklyn, New York, announced his resignation on November 27, 1898, to take effect March 1, 1899. This action was brought about by his inability longer to perform both the duties of pastor and of editor of the *Outlook*. The resignation was reluctantly accepted. He was born in Roxbury, Massachusetts, December 18, 1835; was graduated from the University of the City of New York in 1853, and after studying law took up theology and in 1860 was ordained a Congregational minister, settling at Terre Haute, Indiana. In 1887 he entered upon the pastorate of Plymouth Church, succeeding the late Henry Ward Beecher. Besides his constant church work, Dr. Abbott has issued a large number of publications and has had a wide experience in journalistic work; he was associated with Mr. Beecher in the editorship of the *Christian Union*, which became the *Outlook*, of which he is now editor-in-chief. To this work he hopes to devote much of his attention. Among his recent publications is the *Theology of an Evolutionist* (1897). Dr. Abbott's work in religious matters has been preëminently along scholarly and philosophical lines, his endeavor seeming to be to adjust a religious philosophy to practical life. As a preacher and especially as a thinker he is recognized among the foremost men of his day, and it is expected that his already wide influence will be augmented by concentration of his attention upon editorial work. Dr. Abbott's successor in Plymouth Church is the Rev. Newell Dwight Hillis, D. D., of Chicago.

ABERDEEN, Earl of. See CANADA.

ABRASIVES include buhrstones, grindstones, oilstones and whetstones, corundum and emery, infusorial earth and tripoli, garnet, quartz, crystal, pumice-stone and carborundum. All except the last mentioned are natural products. The value of the domestic production, and imports in 1897 was:

	Domestic Production.	Imports.
Buhrstones	\$ 25,932	\$ 22,956
Grindstones	368,058	49,496

ABYDOS. See ARCHÆOLOGY (paragraph Egypt).

ABYSSINIA occupies the eastern portion of Africa between the Italian colony of Eritrea on the north and British East Africa on the south.

Area and Population.—Abyssinia has an area, including its dependencies, of 150,000 square miles and an estimated population of 3,500,000. By a treaty in 1808 King Menelek ceded about 8,000 square miles of Somaliland to Great Britain. Abyssinia lays claim to an extensive tract of Somaliland north of British East Africa but the strip on the sea coast was ceded to Italy by the treaty of Adis Abeba. It is commonly forgotten that Abyssinia includes several distinct nations speaking different languages. It comprises the three large provinces Tigré on the north, Amhara on the south, and Shoa on the southeast. In the first named of these the Ethiopic tongue is spoken and in the other two the Amharic. There are many towns but none of them have a large population. The principal towns are Gondar, capital of Amhara; Adua or Adowa, capital of Tigré; and Adis Abeba capital of Shoa and the present residence of the emperor or king.

Racial Characteristics, Religion and Education.—The people are said to be of good physique and to have great powers of endurance. They are above the average height and show little if any resemblance to the other tribes of Africa. They are well fitted for long and difficult marches, being hardened by exercise in the climbing of their native mountains, and they make good soldiers. They are reputed to be treacherous and cruel, but these characteristics appear chiefly in their dealings with their foes, and to those with whom they are on friendly relations they often show the most loyal devotion. Education is confined to a few subjects and justice is administered in an exceedingly primitive way. The religion of the state is Christianity, the Abyssinian church being one of the oldest Christian churches in the world. At the head of the church is the Abuna, a Coptic Christian consecrated by the Patriarch of Alexandria in Egypt. Though educated in Egypt this dignitary must, on leaving that country, take an oath never to return.

Production.—Though a progressive people the Abyssinians have been restrained by the despotic government under which they live and have not made any great advance in the arts of civilization. Not much of the land is under tillage and the bulk of the people are hardly beyond the pastoral stage. The heavy taxation is one cause of the failure to cultivate the land to a higher degree. The soil is said to consist principally of black clay and to be well adapted to the growth of wheat, oats, barley, millet, and coffee. Coffee in fact grows wild in many parts of the country. Honey, beeswax, butter, aloes, sulphur, ebony, ox hides, ivory and civet musk are raised. Valuable woods are found in the forests and gold, copper, and iron are among the mineral resources. The trade is comparatively slight but includes the exportation of civet, coffee, wax, ivory and gold. The king controls the trade in these articles. The current coin has been the Maria Theresa dollar, but for this the Menelek dollar is being substituted as the standard coin.

History.—In the nineteenth century the advancement of the country has been chiefly due to the ability of the three emperors or kings, Theodore (1855-68), Johannes (1870-89), and Menelek, the present ruler (1898). Theodore was a man of great ability who appreciated the needs of his country. He tried to advance its prosperity and as a means to that end sought to obtain possession of a seaport. He was overthrown by England in 1868. Johannes, who was the prince of Tigré, then acquired the suzerain power and was crowned in 1872. His aims were rather more warlike than those of Theodore and he showed less statesmanship than the latter. On his death in 1889 Menelek, King of Shoa, came to the throne. Though parsimonious he has shown himself a man of ability, especially in his successful opposition to Italy, which has resulted in the recognition by that power of the complete independence of Abyssinia.

Foreign Relations.—The international relations of Abyssinia during recent years have been very important. It will be remembered that by the treaty of Uchali on May 2, 1889, King Menelek surrendered a considerable part of Abyssinian territory to the Italians, and acknowledged in effect an Italian protectorate over his country. The success of the Italians did not last long. On March 1, 1896, occurred the famous battle of Adowa, resulting in the complete defeat of the Italians, and a loss of 12,000 men, together with a large number of prisoners. Since this battle King Menelek has been engaged in many important diplomatic negotiations. The treaty of Adis Abeba, Oct. 26, 1896, surrendered a large tract of territory south of the Mareb, Belesa and Muna rivers, and recognized the complete independence of Abyssinia. Abyssinia now being left free to manage her foreign affairs, began to treat directly with foreign governments. In January 1897, France formed a commercial treaty with Menelek, and several French parties were sent out on diplomatic missions and tours of exploration. A French railroad was projected to Harrar. In the United States Consular Reports for March 1898, the consul at Adis Abeba writing under date of December 20, 1897, says that the proposed railroad from the principal seaport town of French Somaliland to the city of Harrar in Abyssinia, has reasonable assurance of success. The effect of this railroad is expected to be the development of commerce with Abyssinia, whose trade with the outside world has hitherto been of small ac-

count, the principal exports being gums, hides, coffee, skin, civet, ivory, beeswax and gold, and the imports cotton goods and petroleum. As these exports and imports have been transported by camel in caravans to the seaport towns of British and French Somaliland, trade has been greatly restricted. The resources of the country, however, are great, and no doubt the railroad will greatly develop it. About the close of 1897 the line was surveyed for a distance of about 186 miles. It was planned in the first place as a narrow gauge road, for which a broad gauge should be substituted if the project was successful. The laborers employed have been Somalis and Arabs, who are fitted to endure the intense heat of the country through which the railroad passes.

Treaty with Great Britain.—The English have also been recently engaged in negotiations with Abyssinia. The English interest in this region lay dormant for many years after the Mahdist revolt, and the unsuccessful campaign in the Soudan. It has been revived, however, since the Anglo-Egyptian expedition under Gen. Sir Herbert Kitchener started up the Nile with the purpose of regaining for England her lost provinces. England formally ceded Kassala to Abyssinia by treaty, June 3, 1884, but afterwards recognized the Italian protectorate over all Abyssinia, and transferred to her by special treaty the town of Kassala, with the understanding that it should be given back to Egypt. In December 1897, Kassala was restored to Egypt.

An English expedition under Mr. Rennell Rodd reached Adis Abeba on April 28, 1897. Its object was to renew diplomatic relations and to canvass the British claims in the upper Nile region, and the country of the White Nile. It was planned to form a commercial convention, and to secure coöperation of the King, or at least his neutrality, in the war against the Dervishes of the Soudan. King Menelek, who seems to have considerable diplomatic ability, was not disposed to acknowledge the British claims, and the treaty, which though signed by Menelek, May 14, 1897, was not published until February 1898, was disappointing to many Englishmen. The treaty consists of six articles, of which the first gives each party the right of trade and travel in the territory of the other. The second re-defines Abyssinian and British frontiers at the only point where they were already defined. The third declares the road from Zeila to Harrar open to both nations, while the fourth concedes to British trade the "most favored nation" treatment, and makes Zeila a free port of the Abyssinian state. The English object that these apparent commercial advantages are rendered almost wholly inoperative by a clause which prohibits any armed land, and therefore any properly defended caravan, from entering Abyssinia without previous authorization from the competent authorities. The fifth legalizes the importation of arms into Abyssinia across British territory, and the last proclaims the hostility of the King to the Mahdists. The last article was really no concession, because the Abyssinians being Christians are naturally hostile to the Mohammedan Mahdists. In exchange for these two concessions concerning trade and the Mahdists, England concedes a considerable tract of Somaliland, which is said to have been unfair to the hitherto loyal Somalis, but does not end the Abyssinian claims to the territory around Lake Albert and the right bank of the Nile. The treaty does not secure the political alliance that would be useful to England in her operations on the upper Nile and in eastern Soudan.

Russia, too, has been active in efforts to extend her influence in Abyssinia. There have been several Russian expeditions. In 1895 a party of Abyssinian dignitaries visited St. Petersburg, and in 1897 prominent Russians visited Abyssinia.

Relations with Italy.—The Italian prisoners began to return to Italy in the beginning of January 1897. According to the terms of the treaty of Adis Abeba, all points at issue between the Italian and Abyssinian governments had to be settled within a year of the date of that treaty, October 26, 1896. One point which proved difficult at first to adjust, was the matter of ransom. King Menelek demanded 20,000,000 lire, but afterwards reduced the amount by one half, while at the same time he became more exacting in regard to the frontier. The Italian commissioner for the delimitation of the frontier was Major Nerazzini, and a survey of the region was begun in 1897. King Menelek and the Italian envoy could not agree upon the boundary, and the negotiations lasted a long time. After the battle of Adowa, King Menelek was willing that the river Mareb should mark the frontier, but as time went on, he insisted on another boundary. The Italian government seemed somewhat in doubt as to the proper course to pursue. The Radicals demanded the entire abandonment of the Italian claims in eastern Africa. The majority were opposed to this, but there seemed to be a feeling of uncertainty in the minds of many as to whether it was wise to aim at a wide tract of territory unless the colony was sure to be self-supporting. The Italian envoy concluded with King Menelek a commercial treaty granting freedom of trade and travel to Italian citizens, and among other privileges Italy secured the right to have a permanent representative at the Abyssinian court.

King Menelek, who came to the throne in 1889, and whose capital is at Adis Abeba, is a shrewd, parsimonious man of no mean ability, and is greatly influenced by his clever wife, Ta-hai-itu. He calls himself "King of Kings of Ethiopia," and is dominant chief of a confederation of unrelated tribes, held together by force. His claims embrace a far wider tract of territory than the foreign powers will be willing to acknowledge. This territory stretches from 14 degrees to 2 degrees, north latitude. Its frontiers can best be traced on the map. (See Map of Africa.) England has accepted these frontiers provisionally.

ACADEMIE DE MEDECINE, Paris, *Rue des Saints-Pères, 49*, meets every Tuesday. This institution was founded in 1820 by an ordinance of Louis XVIII to supplant the *Académie Royale de Chirurgie* and *La Société Royale de Médecine* suppressed in 1793. It has served as a model for various medical associations in France and in other countries. The discussions of the *Académie* are published every week in a special *Bulletin*, and important essays in *Mémoires de l'Académie de Médecine*. There are 77 members.

ACADEMIE DES BEAUX ARTS, an outgrowth of the *Académie de Peinture* founded in 1648, *Académie Royale de Peinture et Sculpture*, and *Académie Royale d'Architecture*, is one of the five Societies of *L'Institut de France*. It is composed of five sections: painting, sculpture, architecture, engraving, and musical composition. On its roll of members are many of the most noted names of France.

ACADEMIE DES INSCRIPTONS ET BELLES LETTRES, founded in Paris in 1663 by four members of the *Académie Française*. It is one of the five societies of the *Institut de France* (q. v.).

ACADEMIE DES SCIENCES MORALES ET POLITIQUES, founded in Paris about 1720. It is one of the five societies belonging to the *Institut de France* (q. v.). It is composed of five sections.

ACADEMIE DES SCIENCES, founded in Paris by Colbert in 1666. It is one of the five societies of the *Institut de France* (q. v.). It is composed of 11 sections.

ACADEMIE FRANCAISE (French Academy), founded in 1629, by Cardinal Richelieu, consists of 40 members (the "forty immortals") and meets at the Palais de l'Institut every Thursday. The members now, with the dates of their election, are: Legouvé 1855; Duc de Broglie, 1862; Emile Ollivier, 1870; Alfred Mézires, 1874; Gaston Boissier, 1876; V. Sardou, 1877; Duc d'Audiffret Pasquier, 1878; Rousse, 1880; Sully-Prudhomme, 1881; Cherbuliez, 1881; Perraud, 1882; E. Pailleron, 1882; F. Coppée, 1884; Joseph Bertrand, 1884; Halévy, 1884; Edouard Hervé, 1886; V. Gérard, 1886; Comte d'Haussonville, 1886; Jules Clarétie, 1888; Melchior de Vogüé, 1888; De Freycinet, 1890; J. Viaud (Pierre Loti), 1891; E. Lavisse, 1892; Dangein, 1893; H. de Bornier, 1893; Brunetière, 1893; A. Sorel, 1894; Paul Bourget, 1894; De Hérédia, 1894; H. Houssaye, 1895; J. Lemaitre, 1895; Anatole France, 1896; Marquis Costa de Beauregard, 1896; Gaston Paris, 1896; Theuriet, 1896; Vandal, 1896; Hanotaux, 1897; De Mun, 1897; E. Guillaume, 1898. The fortieth chair is vacant. Secretary, Gaston Boissier.

Twenty-one "*prix littéraires*," and forty "*prix de vertu*" are awarded by the academy annually. Six members are appointed as a Dictionary Commission.

ACADEMY OF ARTS, (*Akademie der Künste*), Berlin, Unter den Linten, 38, founded in 1699, reorganized in 1882, has a section for painting and a section for music. Of the first, Prof. H. Ende is head, and of the second, Prof. Blummer. The Emperor is Protector of the institution. There are five honorary members, among them the Empress Frederik.

ACADEMY OF LISBON, was the outgrowth of the Academy of Portuguese History, founded in 1720 at Lisbon, by John V. In 1779 Queen Marie added an Academy of sciences, agriculture, arts, commerce, and economy. This, reorganized in 1851, is called *Academia real das Sciencias*. It has two classes: the first for science, the second for literature, history, politics, and social science. Since 1779 it has published memoirs of Portuguese history and other works of importance.

ACADEMY OF NATURAL SCIENCES, Philadelphia, founded in 1812, has a valuable scientific library and a very fine collection of natural history specimens, particularly birds.

ACADEMY OF POLITICAL AND SOCIAL SCIENCE, AMERICAN, founded in 1889, has 2,175 members. President, Edmund J. James, University of Chicago; Secretary, H. R. Seager, University of Pennsylvania. See SOCIOLOGY.

ACADEMY OF RAILWAY SURGEONS, AMERICAN, organized in 1894. Next annual meeting in October, 1899, at Omaha, Neb. President, W. W. Grant, M. D., Denver, Colo.; Secretary, T. B. Lacey, Council Bluffs, Iowa.

ACADEMY OF SCIENCES, NATIONAL. See NATIONAL ACADEMY OF SCIENCES.

ACADEMY OF SCIENCES, (*Akademie der Wissenschaften*,) Berlin, Unter den Linden, 38, founded in 1700 by Leibnitz, that great example of universal scholarship, for the "contemplation, the observation of the works and marvels of God in nature, description of discoveries and inventions, works of art, etc., in general all kinds of worthy studies and social culture contributing to the public good, the exercise of virtue, the propagation of truth, and the glorification of the divinity." New laws were made in 1881. The Protector is the Emperor.

ACADEMY OF SCIENCES, Munich, (*Akademie der Wissenschaften*) founded in 1759, is one of the most esteemed academies of the second class. It was recognized in 1809 and in 1829 was divided into three classes: philosophy and philology, mathematics and physics, and history. President Dr. von Pettenkofer.

ACADEMY OF SCIENCES, VIENNA. See ROYAL ACADEMY OF VIENNA.

ACADEMY OF MEDICINE, AMERICAN, organized September 1876. The membership consists of Fellows and Honorary members. The Fellows must have pursued a collegiate course preparatory to studying medicine. Next annual meeting, Columbus, O., June 3-5, 1899. President, Edward Jackson, M. D., Denver, Col.; Secretary, Charles McIntyre, M. D., Easton, Pa.

ACCUMULATORS. These are quite frequently called secondary batteries and sometimes storage batteries. They are voltaic cells in which the means for the development of chemical action is nominally present, but is not active unless so rendered by a chemical alteration, produced by an electric current. The term storage battery which has the sanction of long usage is incorrect since there is absolutely no storage of electricity in the cell. Briefly, an accumulator cell is a battery in which oxidizable metals are used as electrodes, the whole receiving electrical energy at one time and place to give it out at some other time and place.

The discovery of secondary currents is attributed to Gautherot, who, about 1801 while experimenting on the electrolysis of salt water between platinum and silver electrodes noticed a reverse current upon accidentally closing his voltameter circuit. Others started from this fundamental discovery and endeavored to put it to practical use. Among these later experimenters were Ritter, Volta, Davy and a number of others. In 1854 Sinsteden conceived the idea of using oxidizable metals as electrodes to obtain currents of practical magnitude. About 1860 Gaston Planté constructed the first useful secondary battery by immersing lead plates in dilute sulphuric acid. He followed this up with a long series of experiments and produced a really successful secondary battery. As Planté left the accumulator it consisted of two sets of lead plates held apart and immersed in an acid solution consisting of about 90 per cent. water and 10 per cent. sulphuric acid.

Unfortunately these plates had to be "formed," that is, the cell must be alternately charged and discharged for a period of several weeks before it is in working condition. To do this one set of plates is connected with the positive side of some source of electricity and the other set with the negative side. The acidulated water is decomposed, lead peroxide (PbO_2) forming on the positive plate, while the hydrogen is precipitated upon the negative plate without attacking the metal, as a film of gas. This forms a gas battery with the positive electrode composed of lead plates with an insoluble lead peroxide coating and the negative electrode composed of similar lead plates coated with a film of hydrogen. When a circuit is completed through the cell and it is used to produce a current, the hydrogen is oxidized and converted into water, some of the subjacent lead being oxidized at the expense of the water. The peroxide on the other plate is deoxidized or reduced to metallic lead in a spongy form.

In 1879 Mr. Charles F. Brush of Cleveland, Ohio, suggested the covering of lead grids or honeycomb plates with oxides of the same material which could be readily reduced to the ultimate products of formation in the Planté cell. About the same time (1881) Camille Faure in France constructed a cell after the same manner and as a result there has been much litigation which is to some extent responsible for the slow development and adoption of such batteries.

All accumulators may for the sake of classification be included under the following heads:

I. *Planté type*, accumulators having lead electrodes in which the

- (a) Electrodes are lead plates, wires or granulated lead.
- (b) Electrodes are spongy, porous or crystalline lead.
- (c) Electrodes are of amalgamated lead.

II. *Brush-Faure type*, accumulators having supports containing or covered with non-electrolytic lead oxide.

III. *Bimetallic*, accumulators having the positive electrode usually of lead and the negative electrode of zinc, copper, etc.

IV. *All other forms.*

Since the capacity of a cell is limited by the superficial area of the active portion of the electrodes, other things being equal, a large variety of forms of plates have been devised in the case of the Planté type to meet this requirement. Thus some forms have perforated plates, others are filled with pockets made of wire ribbon, etc. With the Brush-Faure type the same is true and in their formation the perforations or opening of the lateral grids are filled, usually under pressure, with paste made by mixing oxides of lead with sulphuric acid, minimum (Pb_3O_4) being used for the positive grid or electrode and litharge (PbO) for the negative. These cells have to be "formed" also, but the time required is markedly less than with the old forms. In the forming, the minimum is converted to lead peroxide (PbO_2) and the litharge to spongy lead of Pb. Another form of cell now quite generally used, employs pure lead as the active material, which is obtained by fusing together the chlorides of lead and zinc. The alloy thus formed is cast into small buttons, square for the negative and round for the positive, a dovetailed groove is made around their circumference, and they are then put in dilute hydrochloric acid, to remove the chloride of zinc, are dried, arranged symmetrically on a flat surface and a frame of antimonious lead is cast about them. Previous to forming, the plates are placed in a bath of dilute chloride of zinc, with alternate plates of zinc, thus forming a short circuited primary battery, until the buttons are reduced to extremely porous metallic lead; the pores being normal to the surface of the plate. Negative plates are left finished ready for use by this operation, while the positives are immersed in dilute sulphuric acid and are charged from a dynamo for two weeks. The spongy lead is thus changed to lead peroxide.

The main troubles to which accumulators are as a rule liable are: "Disintegration" of the active material of the positive plate, "buckling" or warping of the plates, "sulphating" or the formation of white sulphate of lead over the surface of the plates, "short circuiting in part," due to pieces of the paste falling between plates, cracking of jars and the destructive effect of the acid electrolyte upon surrounding objects.

The quantities that must be regarded in the use of accumulators are:

(1) *Electromotive Force*.—The normal maximum voltage in charging should be from 2.4 to 2.5 volts and the minimum to which the secondary batteries should be discharged is from 1.85 to 1.9 volts. It is necessary in charging to have a slightly higher voltage than that of discharge to overcome the internal resistance and leakage of the cell. The density of the electrolyte gradually rises during charging to about 0.05 that of the discharge density.

(2) *Current*.—The amount of charging or discharging current may be varied within certain limits to suit the operator, but manufacturers usually state the best for charging or the maximum safe discharging rate. This is usually expressed in amperes per unit of plate area or per unit weight.

(3) *Resistance*.—Meaning internal resistance of the cells, is always low and generally variable. It depends upon the density of electrolyte, the area and distance between plates and the temperature.

(4) *Capacity*.—This is the quantity of electricity the cell can yield on discharging; it is variable even in the same cell at different times.

(5) *Efficiency*.—This is of two kinds, the "ampere efficiency" or the ampere-hours obtained from the battery, divided by the ampere-hours put into it, and the real or "watt efficiency" obtained by including the voltage as well as the ampere-hours. This is the commercial efficiency and indicates the ratio between the total work done by the cell and the work done in charging the cell. The latter ranges from 82 per cent. to 85 per cent., and the former from 91 per cent. to 97 per cent., but for average commercial work 75 per cent. is nearer the true figure. Depreciation is considerable even under favorable conditions and an allowance of 10 per cent. per annum for actual deterioration, not including interest or taxes, is not excessive.

Uses to which accumulators are put.—To supply portable lamps; to take up fluctuations on lighting circuits and thus steady the voltage and to furnish energy during certain hours of the day or night to enable machinery to be stopped; to aid the generating station in carrying the heavier load which usually exists on the station for only one or two hours; to make the load on the engines more uniform by charging the battery when the load is light; to transform from a higher to a lower potential by charging the cells in series and discharging in parallel or vice versa; to subdivide the voltage, and enable a three or five wire system to be operated by a single dynamo; to supply current from local centers or substations; to run street cars, launches, electric vehicles, and for the operation of portable machinery.

These different uses have required the development of two different types of accumulators: first, the large heavy cell for central station work, with an output ranging from less than 100 amperes for eight hours, or 200 amperes for three hours, to from 2480 amperes for eight hours to 4960 amperes for three hours, giving 1.71 ampere-hours capacity for every pound of complete cell. Second, a light compact

one for portable work, such as launch propulsion and the operation of electric vehicles, which is given in the following table:

Number of plates $5\frac{3}{8} \times 7\frac{5}{8}$ in.	5	7	9	11	13	15
Discharge in amperes for 4 hrs.	15	$22\frac{1}{2}$	30	$37\frac{1}{2}$	45	$52\frac{1}{2}$
Weight of element in lbs.,	14	$19\frac{1}{4}$	$26\frac{1}{2}$	$30\frac{1}{4}$	39	$47\frac{1}{2}$
Outside measure- ment of rubber jars in inches, .	Width,	$2\frac{7}{8}$	$3\frac{1}{4}$	$4\frac{7}{8}$	$5\frac{1}{8}$	$6\frac{7}{8}$
	Length,	$6\frac{1}{8}$	$6\frac{1}{8}$	$6\frac{1}{8}$	$6\frac{1}{8}$	$6\frac{1}{4}$
	Height,	$10\frac{3}{8}$	$11\frac{1}{2}$	$11\frac{1}{2}$	$11\frac{1}{2}$	$11\frac{1}{8}$
Weight of acid in lbs.,	$3\frac{1}{4}$	$4\frac{1}{2}$	$5\frac{1}{2}$	$6\frac{1}{2}$	$7\frac{1}{4}$	$8\frac{1}{4}$
Weight of complete cell in lbs.,	$18\frac{1}{4}$	$25\frac{1}{2}$	$33\frac{1}{2}$	$38\frac{3}{4}$	49	$58\frac{3}{4}$
Height of cell over top of pillar in inches	$11\frac{1}{4}$	12	12	12	$12\frac{1}{8}$	$12\frac{1}{8}$

or an ampere-hour capacity of 4.08 per pound of cell in the smaller and 4.47 ampere-hours per pound in the larger size. It is this type of cell which has within the past year given such excellent service for electric vehicles in New York City and elsewhere. See AUTOMOBILES.

ACETYLENE PURIFICATION. Acetylene, prepared with commercial calcium carbide, is contaminated with notable quantities of hydrogen sulphide and hydrogen phosphide. Both these impurities may be removed by passing the gas through bromine water. This reagent, however, becomes exhausted rapidly, is capable of regeneration, and converts part of the acetylene into bromine derivatives. The hydrogen sulphide is best removed by means of caustic soda solution, and hydrogen phosphide by subsequently passing the gas through a solution of mercuric chloride acidified with hydrochloric acid, or through nitric acid containing a small quantity of a salt of copper or iron in solution. The precipitate produced in the mercuric chloride solution may be collected and dissolved in nitric acid.

ACLAND, SIR THOMAS DYKE, M. A., D. C. L., eleventh baronet, died May 20, 1898. He was born May 25, 1809, was educated at Harrow and at Christ Church, Oxford, subsequently becoming a fellow of All Souls. From 1837 to 1847 he was member of Parliament for West Somerset; for North Devon, 1865-85, and again for West Somerset in 1885-86. He published: A prize essay on *Farming of Somerset; Chemistry of Farming* (1894); *Knowledge, Duty and Faith* (1896).

ACTORS' FUND OF AMERICA, established in 1882 to aid needy actors and pay the expenses of burial when necessary. Contributions from organization to the present equal \$550,000, and \$350,000 has been expended. In June 1898, the fund was \$196,615, the annual members were 862 and life members 118. There are twenty honorary members, including ex-President Cleveland, Chauncey M. Depew, Robert J. Ingersoll, and Ignace J. Paderewski. Officers (1899): Lewis Aldrich, President; Frank W. Sanger and John Drew, Vice-Presidents; Andrew A. McCormick, Treasurer; Edwin Knowles and Adolph Bernard, secretaries; and Antonio Pastor, Augustus Pitou, A. M. Palmer, William E. Sinn, Harrison Grey Fiske, T. Henry French, William H. Crane, F. F. Mackay, William A. Brady, DeWolf Hopper, Francis Wilson, Roland Reed, Charles H. Hoyt, Eugene Tompkins, B. F. Keith and Frank G. Cotter.

ACTORS' SOCIETY OF AMERICA, organized in 1894, consists of 1,200

members. F. F. Mackay, President; William F. Burroughs, Secretary. Headquarters 131 W. 40th st., New York.

ACTUARIAL SOCIETY OF AMERICA, organized in 1889, to promote the science of life insurance, has 205 members. President, Bloomfield J. Miller; Secretary, Israel C. Pierson, 141 Broadway, New York.

ADEN. See **ARABIA**.

ADIS ABEBA, the capital of Shoa in the kingdom of Abyssinia. It was here that the treaty was concluded between Italy and the King Menelek on October 26, 1896, after the crushing defeat that the Italian army had suffered near Adowa. By this treaty Abyssinia regained the entire district to the south of the rivers Mareb, Belesa and Muna, and was recognized as an independent kingdom. The population of Adis Abeba is estimated at 3,000.

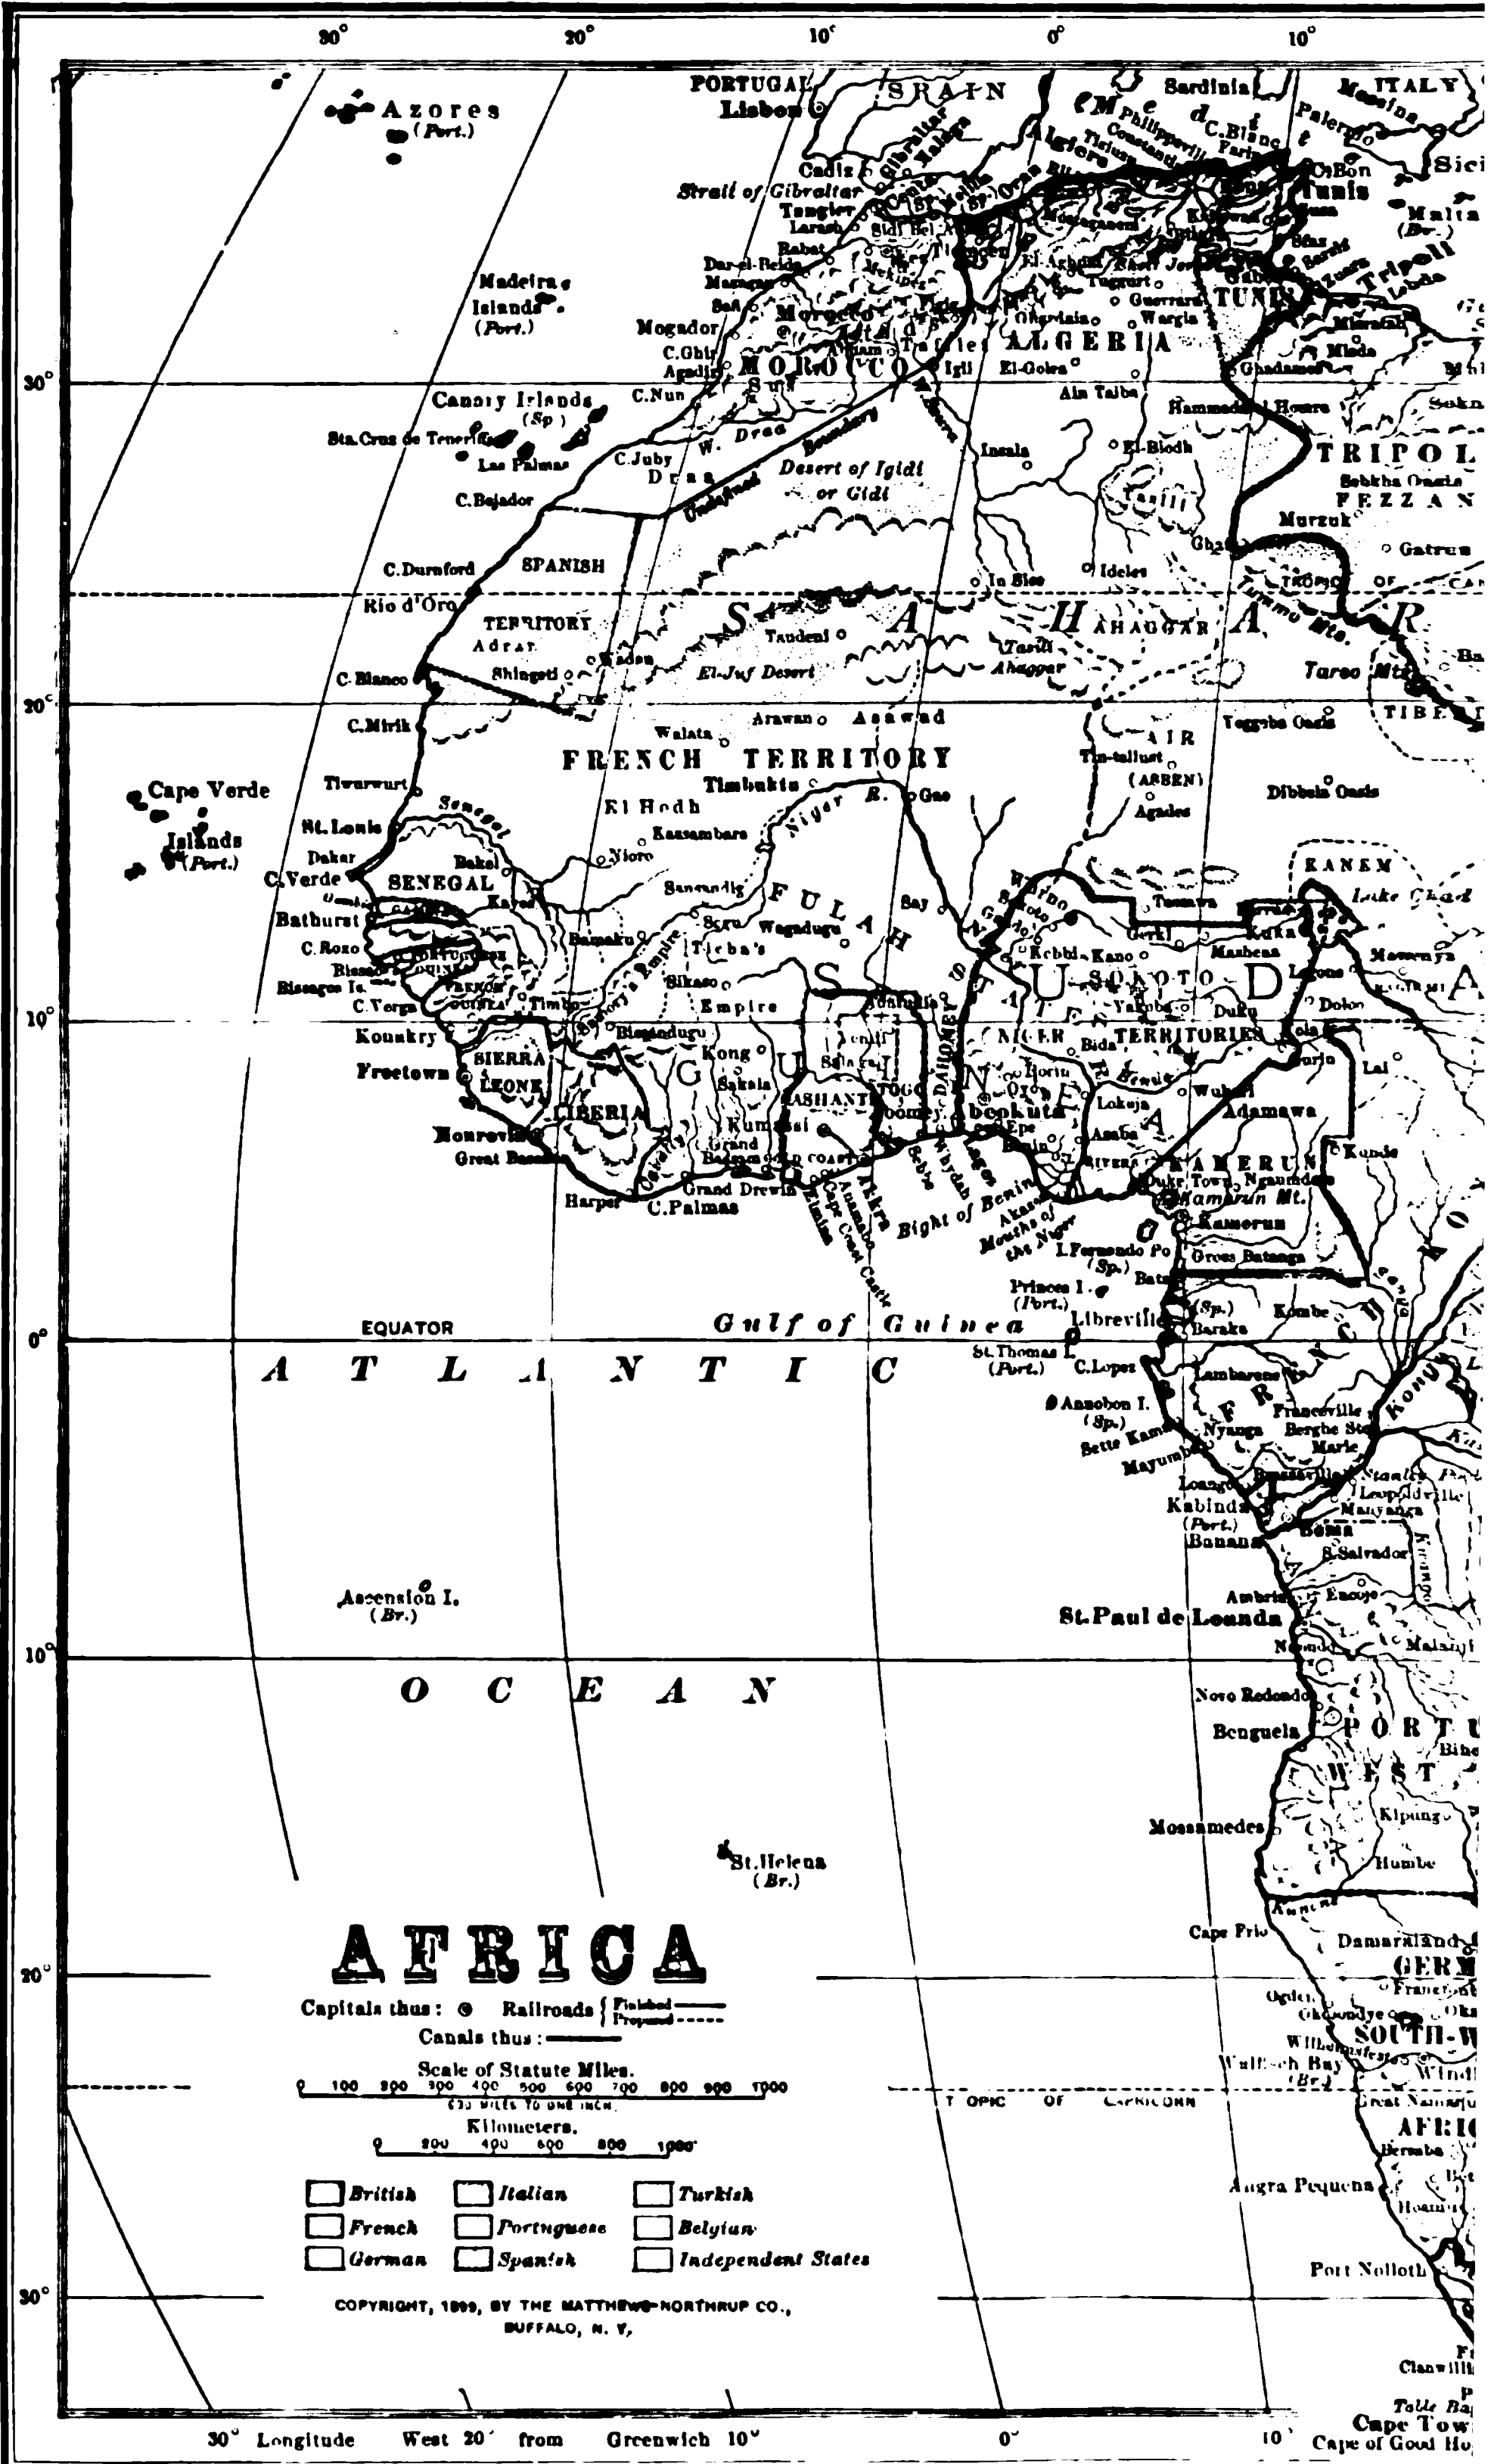

ADVENTISTS comprise (1898): I. Evangelical, with 34 ministers, 30 churches, and 1,147 members; II. Advent Christian, with 912 ministers; 610 churches, and 26,500 members; III. Seventh Day (see **ADVENTISTS, SEVENTH DAY**); IV. Church of God, with 19 ministers, 29 churches, and 647 members; V. Life and Advent Union, with 60 ministers, 28 churches, and 3,000 members, and VI. Churches of God in Jesus Christ, with 94 ministers, 95 churches, and 2,872 members.

ADVENTISTS, SEVENTH DAY, were organized about 1844. The most noteworthy event of 1898 was a general meeting at Hapsburg, Germany, in July, when thirteen nationalities were represented, and the European Union Conference, with Elder O. A. Olsen as president, was organized. The German conference (45 churches and 1,500 members) was also organized. The British Conference (900 members) was also organized at Bath, England, in July 1898. In the past year 42 state and general and more than 400 camp-meetings were held in the United States, Canada, Europe, South Africa, and South America. Altogether 102 missionaries were sent out; the tithe to the General Conference increased over \$18,000 and 12 medical mission and rescue homes were established in the United States. There are now 428 ordained ministers; 260 licentiates; 1,403 churches, or organizations; 50,288 members, and three colleges, with 31 instructors, and 266 students. The church property is valued at \$645,075.

AËRIAL NAVIGATION. Great progress has been made in recent years in the art of aërial navigation. In 1894 Hiram S. Maxim read before the British Association at Oxford a paper describing an experiment he had made with a flying machine which he claimed to be the first machine that was really practicable. In June 1898, a new method was explained by Mr. Davidson before the Aëronautical Society in England. This method involved the use of rotary fans to lift the machine, which was provided with large wing surfaces. In the United States the sum of \$25,000 has been appropriated by the Board of Ordnance and Fortification for experimenting with flying machines for military purposes. In France some important experiments were made on September 20, 1898, and a balloon invented by M. De Santos-Dumont reached a height of 1,300 feet. Its course was said to be easily controlled.

AFGHANISTAN, a country of Central Asia with an area of about 300,000 sq. m. and a population variously estimated at from 4,000,000 to 16,000,000. Since 1893 the trade of Cabul and India has declined. At present the chief articles imported are cotton goods, indigo, sugar and tea, and the exports include horses, spices, asa-fœtida, fruits and nuts. Only a part of the country is allowed to participate in the trade for the heavy transit duties levied by the Ameer prohibit trade between India and the country north of the river Oxus. There is an important trade, however, with Kandahar and Bokhara. It is said that the northern part of Afghanistan is rich in copper. Lead, a good quality of iron and a small quantity of gold are found in some parts of the country. A variety of tribes occupy Afghanistan, the most numerous being the Ghilzais, who number about one-fourth of the 4,000,000 subjects of the Ameer. Other tribes are the Tajiks who are scattered throughout the country and besides these the Duranis, Hazaras, Aimaks and Uzbegs. Adequate statistics in regard to the country are hard to procure. The revenue is said to have increased in recent years, and the Ameer, Abdurrahman, is able to support a considerable standing army. In 1896 it was estimated that on a war footing this army was 50,000 strong. See article **INDIA** (paragraphs on History).

AFRICA. When we bear in mind the fact that less than fifty years ago the map of the center of Africa was for the most part a blank, it is almost impossible to believe that discovery has accomplished so much. The work begun by Livingstone fifty years ago and continued by Burton, Speke, Stanley, Thompson and many others has opened up the interior of the entire country. Yet the greater part of this region is traversed only by explorers' trails and has not been accurately surveyed. And between the routes of explorers there are wide gaps of which little is known. The region to the west and northwest of Lake Rudolf on the east of the Nile is wholly

unexplored and in the western and eastern Sahara there are good fields for further explorations.

But whether explored or not the lands of Africa are at present almost all apportioned with some degree of definiteness as European colonies or native states. This has been almost wholly the work of the present century. In 1798 the knowledge of Africa was limited to Cape Colony in the south and to the Mediterranean countries in the north. Two explorers, Bruce and Mungo Park, to be sure, had visited the Blue Nile and Timbuctoo, respectively, but inner Africa remained an unknown land down to the time of those discoveries which began with Livingstone's journeys to the Zambesi in 1854-1857. This so-called scramble for African possessions did not begin in earnest until September 1884, when Germany having appeared on the coast of southwest Africa and claimed a share, the Berlin Conference was assembled to lay down the rules which should govern European acquisitions and to recognize the new Congo Free State under the sovereignty of the Belgians. From 1884 to 1898 the scramble for African territories has continued with the result that the attention of the whole world is drawn to that continent as the seat of a mighty contest of national claims which at any time may draw the great powers of Europe into war.

The following list shows how far the territories of Africa have been apportioned among the nations of the world:—

INDEPENDENT STATES.....	{	Abyssinia.
		Congo Free State.
		Liberia.
		Morocco.
		Orange Free State.
		Tripoli.
		Ascension Island.
		Basutoland.
		Bechuanaland Protectorate.
		Cape Colony.
		Central Africa (British).
		Central Africa Protectorate (British).
		Mashonaland.
		Matabeleland.
		East Africa (British).
BRITISH.....	{	Zanzibar.
		Mauritius.
		Natal.
		Niger Coast Protectorate.
		Niger Territories.
		St. Helena.
		Tristan da Cunha.
		Gold Coast.
		Lagos.
		Gambia.
		Sierra Leone.
		Somali Coast Protectorate.
		Uganda.
		Walvisch Bay.
		Zululand.
UNDER BRITISH INFLUENCE..	{	Egypt.
		The Egyptian Soudan.
		Transvaal.
		Algeria.
		French Congo.
FRENCH.....	{	French Guinea.
		Madagascar.
		Diego-Suarez, Nossi-Bé, and St. Marie.
		Mayotte and the Comoro Island.
		Réunion.
		Obock.
		Senegal.
		French Soudan.
		Dahomey.
		Tunis.
GERMAN.....	{	Cameroon.
		German East Africa.
		German Southwest Africa.
		Togoland.

ITALIAN.....	{	Eritrea.
		Somaliland.
PORTUGUESE.....	{	Angola.
		Cape Verde Islands.
		Guinea.
		Portuguese East Africa.

The Partition of Africa.—The general results of the partition of Africa down to 1898 are shown in the following list of the areas belonging to or claimed by the European States or still regarded as independent, according to the estimates of J. Scott Keltie, Secretary of the Royal Geographical Society:

France.....	3,300,000	square miles
Great Britain.....	2,300,000	" "
Germany.....	925,000	" "
Congo Free State.....	900,000	" "
Portugal.....	750,000	" "
Italy (including Somaliland).....	420,000	" "
Spain.....	214,000	" "
Boer Republics.....	168,000	" "
Abyssinia.....	195,000	" "
Morocco.....	220,000	" "
Liberia.....	14,600	" "
Turkey (Egypt, including regained territories on the upper Nile) and Tripoli.....	800,000	" "
Mahdi's territories.....	650,000	" "
Wadai.....	150,000	" "
Unannexed Sahara.....	800,000	" "
Lakes.....	68,000	" "
Total Africa.....	11,874,600	square miles

While the description of the different divisions of Africa in the present work will be given in detail under their own heads, it will serve as a general introduction of the subject to give a brief outline of the progress of the powers in the partition of Africa since the Berlin Congress of 1884-85.

The British Colonies in Africa.—To begin with the southernmost point of Africa, it will be seen that Great Britain holds that end of the continent and that her territory extends due north for a distance of 1,800 miles from Cape Town to Lake Tanganyika, her dominions being bounded on the west by German Southwest Africa, the Portuguese territory of Angola, and the Congo Free State; and on the east by Portuguese East Africa and German East Africa, while to the north of Cape Colony and surrounded on three sides by British territory lies the Orange Free State, and to the north of that the other Boer republic called the South African Republic. In this region Great Britain's boundaries are fixed with the exception of the dividing line between British South Africa and Portuguese Angola, Great Britain and Portugal both laying claim to a strip of land lying to the west of the Zambesi. Nearly a million of square miles are included in this tract of British territory and the colonies which constitute it are at different stages of administrative development, ranging from self-governing divisions like Cape Colony to protectorates and spheres of influence. British Bechuanaland, a protectorate, lies to the north of Cape Colony, but beyond this and further to the north is the far wider tract belonging to the British South Africa Company, while between the northern limit of this region and the southernmost point of Lake Tanganyika is the British Central African Protectorate, which is directly under imperial administration. Passing up Lake Tanganyika on the west side of German East Africa, and following the boundary between the latter colony and the Congo Free State for a distance of some 120 miles, we come to the southwest corner of another extensive British tract, known as British East Africa, part of which, namely this same southwest portion lying on the shore of Lake Tanganyika, forms the dependent kingdom of Uganda. The northwestern portion of British East Africa extends far to the west of the White Nile and includes, according to the British claims, the district of Bahr-el-Ghazal, about which much has been said on account of the French demands in connection with the occupation of Fashoda. With the islands of Zanzibar and Pemba, the area of this region is about 800,000 square miles. Its limits have been determined by agreements with Germany and Italy. British East Africa is bounded on the east by Abyssinia and Somaliland and on the south by German East Africa. Great Britain also possesses a considerable tract of territory on the Gulf of Aden with an area of about 75,000 square miles. This completes the list of her possessions in Eastern Africa, except that in Egypt she

exercises control by virtue of a status which has not yet been definitely determined. It is in the country to the north of British East Africa on the upper courses of the Nile that the famous campaign of Sir Herbert Kitchener has been going on in the year 1898 for the purpose of regaining for Egypt the lost provinces of the Soudan. To pass now to the western coast of Africa, another great tract of British territory lies around the lower courses of the Niger. The area of the Niger territories, as determined by agreements with France and Germany and with the native princes, included in 1898 about 500,000 square miles. Along the coast at the mouth of the river this territory is known as the Niger Coast Protectorate and is administered by the Royal Niger Company. The eastern boundary separating the Niger territories from the German colony of Cameroon has been fixed beyond dispute and on the north the boundary separating the British possessions from the French has also been determined, but the western boundary became a subject of dispute between France and England in 1898, the French having occupied Bussa and other places claimed by the British. This dispute was settled by an agreement announced in August 1898, the French having abandoned their claim to Bussa in return for some territorial concessions (see NIGER TERRITORIES). The district of Lagos (q. v.) to the west of the Niger river belongs naturally to the Niger region. The other British lands on the western coast are the Gold Coast, Sierra Leone, and Gambia, all of which are surrounded on three sides by foreign territory and blocked against expansion toward the interior.

The French Possessions.—The enormous possessions of France in Africa include the greater part of the Sahara region which was guaranteed to her by an agreement with England in 1890. Since this barren district makes up such a large part of her territory, the worth of her African possessions does not correspond to their area in square miles. Her foothold in Africa dates from the time when she established factories along the western coast of Africa. Traders from Normandy visited the Senegal as early as 1626, and under Louis XIV, the Royal Company occupied a long strip of territory which was afterward by the Treaty of Nimeguen guaranteed to France. She acquired Algeria after her war for the suppression of the Algerian pirates in 1830. The French claims in Africa cover a territory comprising about 3,300,000 square miles, including Madagascar. In Algeria and Tunis her claims established by right of conquest seem not to be disputed. The broad tract of the Sahara desert, lying to the south of Algeria and extending to the Ivory Coast and comprising the whole distance from the shores of the Mediterranean to the Gulf of Guinea, is all hers. Morocco lying west of Algeria cuts off the northwest portion of this tract and adjoining it to the southwest is the Spanish tract known as Rio d'Oro. At Cape Blanco the French tract emerges on the coast along which it extends, including Senegal, to the northern limit of British Gambia. Portuguese Guinea to the south of Gambia also indents the French territory which, however, reaches the coast again in French Guinea. Then the English dependency of Sierra Leone and the free state of Liberia interrupt the French coast line which is once more resumed on the Ivory Coast on the Gulf of Guinea. To the east of the Ivory Coast lies the Gold Coast belonging to Great Britain and to the east of this the German possession called Togoland. Then comes a block of French territory, Dahomey, bounded on the west by Togoland and on the east by the Niger Territories. The French claims embrace the greater part of the Upper Niger, including the bend as far as Say. There have been disputes recently over a small area lying behind the British Gold Coast and German Togoland. In 1898 an agreement was reached with Germany in respect to the latter. For an account of the dispute with Great Britain see the article NIGER TERRITORIES. The southwestern part of this extended and continuous French tract is known as the French Soudan, but Senegambia is the name given to the most westerly portions. The French Soudan and Senegambia together cover about half a million square miles, and the French Sahara has an estimated area of 1,500,000 square miles. Another important French possession in Africa is the French Congo extending along the western coast from the German possession of the Cameroon on the Bight of Biafra to the point at which the Congo Free State and Portuguese Angola meet on the coast and along the northern side of the Congo and into the interior as far as Lake Tchad on the northwest and British East Africa on the east. The boundaries between French Congo and German East Africa and the Congo Free State have been determined, but on the east the line is still unsettled and here is the seat of the conflict of claims with Great Britain, especially in respect to the Bahr-el-Ghazal district, which was one of the abandoned districts of the Egyptian Soudan. This district was included in British East Africa by an agreement between Great Britain, Germany and Italy, but France did not consider this agreement binding upon her and a serious international complication arose out of the expedition of Major Marchand to Fashoda (see EGYPT). France is ambitious to carry her territory in an unbroken line between the eastern and western coasts, but Great Britain has barred the way, having declared a few years ago that any

attempt of France to establish herself on the Nile would be regarded as "an unfriendly act."

On the eastern coast France has a little wedge of territory called Obok, or Obock, extending inland from the mouth of the Red Sea, opposite the British possession of Aden; also the important island of Madagascar with an area of some 280,000 square miles.

German Possessions.—Germany began her career as a sharer in the African spoils by the acquisition of Damaraland and Namaqualand on the southwestern coast with an area, according to an arrangement with England, of 322,450 square miles. On the East African coast her territory is of more value. It is known as German East Africa and is bounded on the north by British East Africa, on the west by the Congo Free State and British Central Africa, and on the south by Portuguese East Africa. There is access to the water in any direction; on the northern boundary lies the lower half of Lake Victoria, on the western Lake Tanganyika throughout its entire length forms a part of its boundary, and on the southwest Lake Nyassa divides it from British Central Africa. Its limits have been determined by agreements with England, Portugal, and native princes. Its area is placed at 385,000 square miles. Germany also has in the Cameroon on the western coast some 190,000 square miles of property, extending northeastward to the southern shore of Lake Tchad. This is a thickly populated country and shows signs of advancement. Togoland, also German, is a wedge of territory extending inland from the Gulf of Guinea and expanding into a broad hinterland whose limits have been roughly defined by an agreement with France. In this neighborhood, however, there is still a region, the claims to which await adjustment between Germany and England.

Portuguese Possessions.—Portugal, the oldest sharer in African lands and formerly the claimant to an enormous empire, is now restricted to the large block of territory called Angola on the western coast and a strip extending north and south of the Zambesi on the eastern coast. There is also a small wedge of territory belonging to Portugal on the western coast between British Gambia and French Guinea, and she still holds the Cape Verde Islands and St. Thomas, making a total area of about 750,000 square miles. She has shown little enterprise in the management of her colonies and in a large part of the region which ostensibly belongs to her she has effectually occupied hardly more than the coast.

The Congo Free State.—The Congo Free State, lying in the basin of the great Congo river, was established on its present basis by the Berlin Congress of 1884-85, its boundaries being defined by agreements with the various powers. Under the management of Leopold II, King of the Belgians, it has flourished and at present covers over 900,000 square miles, with a population of about 30,000,000. See the article CONGO FREE STATE.

Italian Possessions.—Next to Portugal the country that has shown the feeblest grasp on African territories is Italy. In 1870 an Italian trading company gained possession of a small district near the mouth of the Red Sea for the establishment of a coaling station. Twelve years later the Italian government joined actively in the race for African lands and pushed the boundaries of its possessions northward till they reached a point on the Red Sea about 650 miles to the north of the limits acquired in 1870. This point was reached in 1888. After that Italy began a course of aggression toward Abyssinia which resulted in the ultimate failure of her plans. After the defeat of Adowa in 1896, she gave up her projected conquest of Abyssinia, recognized the independence of that country, and submitted to terms which confined her to a strip of territory along the Red Sea containing about 88,500 square miles. This is the Italian colony of Eritrea. Her claims, however, embrace some 335,000 square miles in addition, namely the tract which runs southwest along the coast from the gulf of Aden and includes a large portion of Somaliland. She has shown herself unable or unwilling to make the necessary sacrifices for the retention of her colonies and has followed the policy of military occupation rather than permanent settlement. This fact, combined with the vigorous policy of the Abyssinian monarch led in 1898 to the prediction that Italian enterprise in East Africa was doomed to an early failure.

Spanish Possessions.—Spain, whose importance as an African power, is hardly worth reckoning, has, in addition to the Rio d'Oro on the northwest coast, the Canary Islands, Tetuan in Morocco, and a few other small tracts, amounting to about 3,800 square miles.

Other States.—As to Egypt a description of her territories and claims more properly belongs to the article on Egypt. The Soudan provinces of Egypt have an estimated area of 800,000 square miles, while Egypt itself covers about 400,000. To the west of Egypt lie the Turkish possessions of Tripoli and Fezzan, to the south of which is the wide unannexed territory of the Sahara, covering about 800,000 square miles. The southern portion of this unannexed territory, Wadai, abuts on French territory, and, it is thought, will eventually be annexed by France.

Morocco is still unannexed and governed by a native sultan. Other free states

are Liberia, whose territory, however, has been considerably cut down by French encroachments and in 1898 amounted to only about 14,600 square miles; and the two Boer republics, namely, the Orange Free State and the Transvaal (qq. v.).

Such was the general condition of Africa in the year 1898. The above account is based on the authority of J. Scott Keltie, Secretary of the Royal Geographical Society of England. Further details in regard to the separate divisions will be found under their respective heads.

The African Situation in 1898.—During the year 1898 the rivalry between the sharers in African territories was sharpest in the case of England and France, whose contest was carried on in two widely separated parts of the continent—first in West Africa in the region of the Upper Niger, and second in East Africa in the region of the Upper Nile. Of these two disputes the second was by far the more important, for in the region of the Upper Nile the trans-continental schemes of the two great powers came into direct conflict. France was naturally eager to open her line of communication directly across the continent from east to west, bringing her sphere of influence in the Sahara and her Congo colony into connection with her little strip of territory on the gulf of Aden. England on the other hand had even more at stake. For many years she had dreamed of a great African Empire which should extend from the Cape to Cairo. The work of the ablest Englishmen in Africa has tended steadily in that direction. What seemed ten years ago to be merely a vague hope appeared in 1898 to have a fair prospect of realization. The work of Cecil Rhodes, Sir Henry Johnston, Captain Lugard, Sir Henry Colville, Lord Cromer, Lord Kitchener and many others has carried the British influence in Africa to the point at which it may be said that the Cape to Cairo policy is almost an accomplished fact. In 1898 the distance from the Cape to Cairo, 6,300 miles, could be covered in 81 days, and it was expected that by 1905 the time would be reduced to 43 days. A trans-African telegraph line is being pushed forward with rapidity; there are British steamers on Lake Tanganyika, and the railway on the Upper Nile is in steady progress. The only interruption to the English line of connection between Egypt and Central Africa in 1898 was the strip which had been ceded to Germany between Lake Tanganyika and Uganda.

English and French Colonial Systems.—England's work in Africa has been greatly praised. Many critics hold that she has done more for the civilization of the continent than any other power. Even among the French there are some who take this view. For instance a French writer in 1898 contrasts the success of the British with what he calls the failure of the French in Algeria and Tunis, and goes so far as to say that under British rule Algeria would become in less than five years time a most prosperous colony, a result which France has not brought about during the whole sixty years of her rule. Madagascar is also taken by this writer as an instance of French inefficiency. He estimates the cost of its conquest by France at 4,000,000 pounds and the lives of 6,000 Frenchmen. And when the island was once in the hands of the French they immediately imposed prohibitive duties on foreign goods with the idea of keeping it for French trade, but with the result of checking trade altogether. On the other hand England's policy of the open door in her colonies has led to a great development of trade in which all countries have shared. How effectively this policy is carried out appears from the fact that in many of the British colonies and in Egypt a large part of the increase of the trade consists of the commerce with other countries than Great Britain.

Yet this unfavorable comparison between the British and French colonies in Africa does not seem sufficiently to take into account the restricted resources of France or the fact that the French in Africa have hitherto been actuated by military rather than commercial motives. France has not yet begun to develop her newly acquired lands because she has applied herself too eagerly to the extension of her borders. But in the spread of her military occupation she has done much for the cause of humanity by policing savage districts and suppressing the slave trade and other barbarous practices. And the establishment of an efficient police is, after all, the first duty of a power that would attempt to civilize Africa. For some account of the two great territorial disputes between France and England in 1898 see the articles NIGER TERRITORIES, EGYPT.

AGASSIZ ASSOCIATION, founded in 1875 to encourage personal work in natural science among young people, was incorporated in 1892 in Massachusetts. Its organ is the *Popular Science News*. The society had (1898) more than 100

chapters in various parts of the world which make zoölogical, botanical, entomological, etc., collections.

● **AGRARIAN MOVEMENT** is of long standing in the Austro-Hungarian Monarchy.

Galicia.—During 1896 and 1897 it was especially pronounced in Galicia, where it dates from the time when Galicia was annexed to Austria. The old village community known as the *Mir*, a Slavonic inheritance, had formerly been in existence there and when it was abolished for the system of private property the peasants complained that their rights had been disregarded in the apportionment, although a part of the forest and pasture land continued to be held in common. From this arose a sharp antagonism between the peasants and their landlords, and at the time of the revolutionary movement of 1848 the families of the latter suffered from a violent outbreak of the peasantry. It was not put down until many outrages had been committed on the families of the landlords and it required the interference of the imperial troops to restore order. This grievance still continues among the Galician peasantry, but is felt more strongly at the present time in the western part of the province than in the eastern which had been the scene of disturbance in the past. A very active spirit in stirring up and leading the malcontents was Father Stojaloffski, a priest whose social philosophy is based on the teachings of Karl Marx and whose political creed rests on a rooted belief that landlords are tyrannical and government officials unjust. After repeated ecclesiastical punishments he gave up his living in Galicia and placed himself under the jurisdiction of the church in Albania, but he remained in Galicia where he edited two magazines of a somewhat social-democratic character. He continued to appeal to the passions of the people in spite of frequent government prosecutions and an excommunication by the Pope. This excommunication against which he protested on the ground that it was contrary to church law, did not seem to impair his influence even in that strongly Catholic community in which he resided. His preachings revealed a hatred of the Jews and a tendency to draw toward his Slavonic kinsmen in Russia, but his main idea was the rendering of justice to the peasantry which he asserted had been robbed of its rights by the nobles. At last the hostility of the government drove him to Hungary, where the authorities refused an application for his extradition. His influence was very powerful in the electoral campaign of 1897, when he appealed to the peasantry to send honest representatives to the *Reichstag* and to vindicate their rights which had been betrayed by the landlords. Agrarianism was active also among the Ruthenians and there took the definite form of a demand that the large estates should be purchased and divided into peasant holdings. The Ruthenians also had national aims, but on this Agrarian policy they were in accord with their Polish neighbors.

Hungary.—In Hungary the Agrarian movement has not been prominent until recent years. It differs in its spirit from the movement in Galicia for it seems to have arisen from the spontaneous action of the Hungarian peasants without the stimulation of enlightened leadership and exhortation. The movement came to light at the time of the meeting of the Agricultural Labor Congress at Budapest early in February 1897, when steps were taken to establish on a firm footing an organized party for Agrarian and socialistic ends. Among the points in the platform of this party were an insistence upon the reduction of hours, the increase of wages and the abolition of the corvée system. The movement seemed to be strongest in the most fertile parts of Hungary where the bulk of the population were landless and derived their subsistence mainly from working as agricultural laborers on the farms of the large proprietors, for in this region the land is divided for the most part into quite large holdings. The weapon which the Agrarians threatened to use to enforce their demands was the organization of strikes. The government showed a willingness to listen to the grievances of the landless people in this section but it was hard to find a suitable remedy. The reduction of the hours of labor seemed likely to injure rather than benefit the working classes, since their work being mainly agricultural, depended upon the seasons and cutting down their hours during the season of their employment might cause actual hardship. On the other hand, the price of agricultural produce was so low that a general increase of wages was impossible. The discontent was not confined to the agricultural classes, however, but showed itself among the industrial workers. In January, 1897, a serious strike occurred among the coal miners at Temesvar in Hungary, and resulted in a conflict between the strikers and the gendarmes in which nine persons were killed and eleven wounded. There was also a threatened strike of the harvesters, and violence was averted only by a show of force on the part of the government. There were socialistic riots in June, 1897, in some of the peasant communes and many persons were arrested as rioters. In the Alföld district there was a strike of the harvesters and in spite of the importation of labor and the threats of the government, it was almost impossible for the land owners in that district to get in their crops. In Croatia-Slavonia a large body of peasants armed themselves and attacked the Hungarian officials, two of whom they killed.

The government was obliged to declare martial law in this region. Many arrests were made and the government made a show of military force to overawe the malcontents. Affairs were especially threatening in Slavonia where the land was held largely by great proprietors who were often absentees. Of course the racial question enters into this Agrarian movement and adds to the hard feeling, for there is a strong party which favors the separation of Croatia from Hungary and the formation of an independent Slavonic kingdom comprising several of the provinces of the Empire.

On Christmas Day, 1897, a meeting of agricultural laborers was held at Budapest and formulated various demands in respect to industrial and political matters, including the eight hour day, universal suffrage, secret ballot, free education, and the abolition of the army. There was an open revolt of the peasantry in the neighborhood of Hatzfeld in March, 1898, and the gendarmes who were sent against them were put to flight. But the government at Budapest had already promulgated a law (March 1) to promote the interests of ordinary day laborers and agricultural laborers. This law required that every agricultural laborer should have a certificate of registration before applying for employment on a farm. He must also sign a formal contract before an official who retains this registration certificate till the contract is fulfilled or legally dissolved. If the workingman breaks his contract his certificate is forfeited for a year, and the wages due him are paid over to an official who deducts what may be due to the employer for damages and applies the rest to public poor relief. But to protect the workingman in his rights, it is required of the employer that he shall supply good food when food is stipulated in the contract, and furnish his employee with medicines and medical attendance for a period of days during sickness. The employer is also required to find other employment for the laborer in case the weather prevents the latter from working in the fields or shall pay him his wages during this period of enforced idleness provided that it lasts no more than a week. On the expiration of a full week the contract may be cancelled. The provisions of the law are enforced by severe penalties. Besides improving the condition of the agricultural laborer the law aims to put an end to political or socialistic agitation and imposes heavy penalties on men convicted of inducing others to violate their contracts or of attempting to stir up discontent among the workingmen.

Germany.—In Germany the Agrarian movement is wholly different from that in the provinces of the Austro-Hungarian monarchy. German Agrarianism has not its root in socialism. Its origin and progress in Germany are due to an organization known as the League of Husbandmen (*Bund der Landwirte*) which was founded in 1893. This association arose from the discontent of the agricultural element in the population in regard to the policy of the government in dealing with the agricultural interests but especially its regulations affecting foreign trade. The agriculturists considered themselves injured by the commercial treaty with Austria formed under Chancellor von Caprivi's administration and the commercial treaty with Russia which had previously been established. A meeting was held in Berlin and the representatives of the agricultural interests there determined to form an organization which should have as its exclusive aim the promotion of the welfare of the agricultural classes in Germany, without regard to political parties or wealth or influence. It was declared that the attitude of the government toward the foreign trade in grain was injurious to the farmers' interests. Its proper policy was to protect the domestic producer and try to bring about the independence of the home market. The system of universal free trade and *laissez faire* was condemned, and on the other hand so were the principles of socialism. The chief ends for which the organization was striving were outlined in its published platform. Among them were the following: Native products must be protected against foreign competition. The rules governing the stock exchange must be reformed, especially in regard to the speculation in the necessities of life. Improved regulations should be introduced in regard to the warehousing of goods in transit. A better system of valuation should be introduced into the customs administration. Taxation should be reformed with a view to the more equal distribution of taxes and special regard should be shown to the agricultural interests until they attained their normal strength. There should be a reform of labor legislation, an encouragement of neighborhood trade in agricultural products, the protection of native products against cheap foreign substitutes and against adulteration of fodder and fertilizers, the appropriation of a large sum for improvements, the building of railroads in the interest of the agricultural classes, and a reform of the tariff system. These are the principal demands of the League. It carries on its work by means of assemblies and by the influence which it brings to bear on candidates for the legislative bodies. It requires a definite answer from these candidates without regard to their political party as to their sympathy with the aims of the organization and unless these answers are satisfactory the League withholds its support.

AGRICULTURE. See the articles on Countries and on the States of the United States; also special articles on BARLEY, CORN, OATS, WHEAT, and other farm products.

AGRICULTURE, U. S. DEPARTMENT OF. See IRRIGATION, PAVEMENTS and ROADS.

AGUINALDO, EMILIO, the leader of the Filipino insurrection against Spain, and of the opposition to the acquisition of the islands by the United States, was born about thirty years ago. The facts of his life are obscured by the conflicting statements made in regard to them. There is uncertainty even as to his parentage, some accounts stating that he was a son of a Spanish general, and others that his father was a dissolute, but learned Jesuit priest. As a child he was a domestic servant in the home of a Jesuit priest in the province of Cavité, where he was well treated, and received advantages in education far beyond those usually accorded to native children. He showed himself an apt scholar and at the age of fourteen or fifteen was enrolled in the medical department of the Pontifical University at Manila. About 1888, having had some trouble with the authorities, he went to Hong Kong where he observed closely all matters pertaining to military and naval warfare and added to his linguistic knowledge, which is said to be considerable. Upon the outbreak of the insurrection in the Philippines in 1896 he became prominent and when the Spanish authorities finding the insurrection unexpectedly formidable proposed certain concessions to the demands of the insurgents, Aguinaldo was one of the peace party. This party finally prevailed, but the compromise agreed upon required that the leaders should leave the country. Aguinaldo then withdrew to Hong-kong where he remained until after the battle of Manila, and where he is said to have had many conferences with the United States Consul, Mr. Wildman. Aguinaldo, Agoncillo and the other Philippine leaders stated that Consul Wildman had promised on the authority of the United States government that the Philippines should be independent. This was denied by the Consul who said that he had merely tried to obtain the aid of the revolutionists in the campaign against Spain. After the battle of Manila, Aguinaldo landed in the Philippines and aided the United States force against the Spaniards, doing, it is said, very efficient work. In June he organized a provisional government for the islands and on the 23d of that month became its president and generalissimo of the Philippines. For an account of his attitude toward the United States when he became convinced that the latter power intended to annex the Philippines, see the article UNITED STATES (paragraphs on History).

AINOS, a people of primitive customs, inhabiting principally the island of Yezo, Northern Japan, of whom until recently but little has been definitely known. They seem to be an older race than the Japanese, are short, stout, dark, and have a European rather than an Asiatic cast of countenance. The men have noble faces; the older ones wearing long beards and masses of thick hair parted in the middle. Almost all of them are habitual drinkers of *sake*, a native intoxicant, and their chief amusement is the bear hunt with its subsequent festival. The women, except when very young, are ugly in appearance, extensive tattoo marks aggravating the disagreeable effect; a heavy, blue-black tattoo band about the lips is a distinctive female fashion. They have a stolid, hopeless expression, which is caused by their constant repression, for they are considered so much inferior to men that they are not supposed to have souls and are therefore allowed no part in religious exercises. The Ainos have little energy and no ambition; they are exceedingly ignorant and superstitious, having no written language and being fetich-worshippers, but they are amiable and full of kindly hospitality, which they show with a shy, child-like simplicity. They wear robes of elm-fiber or cotton, and their huts, utensils, and persons are always very dirty. Medicines and care of the sick are almost entirely recent innovations. Being horrified by the presence and even the thought of death, they have no cemeteries, but bury their dead in some lonely place in the forest the location of which is soon forgotten.

Although the Japanese government makes laws for the protection of the Ainos, and a society exists in Sapporo for their assistance, it is evident that they are steadily disappearing before the aggressive, western-spirited Japanese. According to an account published in 1898, they number about 17,000. Aino curios are rare; a small collection has been made by the Peabody Museum in Salem, Massachusetts.

AIR LIFT PUMPS. See WATER-WORKS.

ALABAMA, one of the Gulf States of the United States, with an area of 52,250 sq. m. Capital, Montgomery.

Agriculture. The following shows the production and value of the principal crops in the calendar year 1898: corn, 39,681,630 bushels, \$16,269,468; wheat, 519,708, \$467,757; oats, 5,383,274, \$2,207,142; rye, 21,745, \$22,832; potatoes, 482,406, \$400,397; hay, 100,755 tons, \$931,984; cotton (season of 1897-8), 1,112,681 bales, \$31,999,174—total value, \$52,298,754. Live stock, January 1, 1899, comprised, horses, 132,224; mules, 129,726; milch cows, 254,727; other cattle, 336,479; sheep, 193,033; and swine, 1,866,640—total head, 2,912,829.

Industries.—In 1897 Alabama ranked fifth in production of coal, with an output of 5,893,770 short tons, value \$5,192,085; third in iron ore, with a product of 2,098,621 long tons, mostly red hematite, value \$1,546,543; and third in coke, using 2,451,475 short tons of coal and producing 1,443,017 short tons of coke, value \$3,094,461. During the year the State found a new and highly profitable market for its iron in Europe and one for its coal in Mexico. Two more large cotton mills were contracted for, to cost \$600,000 and \$500,000 respectively. Thirty-seven cotton and woolen mills were in operation, which had an aggregate of 380,866 spindles, more than four times the number in use in 1890.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise at the port of Mobile were valued at \$1,124,401, an increase in a year, and the exports were valued at \$9,584,248, a decrease. The imports of gold and silver amounted to \$50,852, and the exports of gold alone to \$5,000. The total trade of the port was \$10,764,501, a decrease of \$262,424 from that of the previous year.

Railways.—In both 1897 and 1898 Alabama led all the Southern States in the amount of railroad mileage actually under construction. The State Railroad Commissioners reported at the end of 1897 a total of 3,524 miles of main track, and there were then fully 300 miles of additional track under construction. Combining the main and double tracks with the large number of feeders and sidings the mileage in operation at the end of 1898 exceeded 4,300.

Banking.—On October 31, 1898, there were 26 national banks in operation and 13 in liquidation. The active capital aggregated \$3,205,000; outstanding circulation, \$1,280,553; deposits \$6,765,332; and reserve, \$1,835,625. The State banks on June 30, 1898, numbered 15, and had capital, \$686,000; deposits, \$1,280,819; and resources, \$2,243,563.

Education.—At the close of the school year 1896-7 there were 621,600 children of school age in the State, of whom 319,526 were enrolled in the public schools and 213,000 were in daily attendance. The percentage of enrollment by races was, white, 65.57; colored, 68.45. There were 4,725 white teachers and 2,398 colored. Public school property exceeded \$1,500,000 in value, and the total expenditures, excluding payments of bonds, was \$663,359, of which \$618,668 was for teachers' salaries. The public high schools numbered 52, and had 126 teachers and 2,547 pupils, and the private secondary schools, 76, with 185 teachers and 3,165 pupils. There were 6 public and 5 private normal schools, with a total of 2,423 students. For higher education there were 9 colleges and universities, co-educational and for men only, with 92 professors and instructors and 1,650 students; 10 colleges and seminaries for women, with 102 instructors and 918 students; an institute of technology; a law, 3 theological, and 2 medical schools; and 13 institutions for the higher education of the colored race. The Alabama Polytechnic Institute at Auburn, endowed by Congress, received from the Federal treasury \$22,000 in 1897 and \$23,000 in 1898. In 1898 there were 219 periodicals in the State, of which 17 were dailies, 181 weeklies, and 12 monthlies.

Finances.—The total bonded debt of the State in March 1898, was \$9,357,600, of which the greater part is due in 1906. The property valuation in 1897 was \$251,390,134; tax rate, 5½ mills; and amount of taxes \$1,384,171.

Population.—As estimated by Federal officials, the population on June 30, 1898, was about 1,690,000.

History.—The history of the State during 1898 is a very quiet one. On June 16 the negro Republican leaders held a State Convention and nominated a full black ticket, which had never been done before. The Democratic State Convention reaffirmed the Chicago platform of 1896. At the election the Populists were beaten and the Democrats carried everything. Joseph F. Johnston was elected Governor by a plurality of 59,772. A new code went into effect in February, embodying some changes in criminal cases of appeal to the Supreme Court. When the court is satisfied that a defendant got substantial justice in a criminal case it shall not reverse the judgment because of error in the record. The married woman's law is also changed, so that she is treated as a *femme sole*, except as to her real property. Women are also made eligible to fill the office of Register of Chancery; several already hold that position. The new code abolishes the rule requiring two witnesses to overcome the sworn answer of the defendant. In December the Governor signed a bill passed by the legislature for the election of a convention to make a new constitution for the State. The convention is expected to devise some scheme for eliminating the colored vote under the forms of law. It would appear, therefore, that Alabama is likely to follow the example set by Mississippi, South Carolina, and Louisiana in regard to establishing white supremacy.

National Representatives and State Officers.—The Representatives from Alabama are all Democrats: George W. Taylor, Jesse F. Stallings, Henry D. Clayton, Gaston A. Robbins, Willis Brewer, John H. Bankhead, John L. Burnett, Joseph Wheeler, and Oscar W. Underwood. The Senators are: John T. Morgan, from Selma,

and Edmund W. Pettus, from Selma, both Democrats. Joseph F. Johnston, Governor; R. P. McDavid, Secretary; George W. Ellis, Treasurer; Walter S. White, Auditor and Comptroller; Robert F. Ligon, Adjutant-General; C. G. Brown, Attorney-General; J. W. Abercrombie, Superintendent of Education; Isaac F. Culver, Commissioner of Agriculture. All of these are Democrats. Justice of the Supreme Court, Thomas N. McClellan; Associates, Jonathan Harolson, John K. Tyson, Henry A. Sharpe, and James K. Dowdell; Clerk, R. F. Ligon, Jr. All are Democrats. The State legislature is Democratic by an enormous majority.

ALASKA, a territory of the United States comprising the northwestern part of North America, purchased from Russia in 1868, has an area of over 500,000 square miles and a population, estimated by Federal officials on June 30, 1898, of about 50,000.

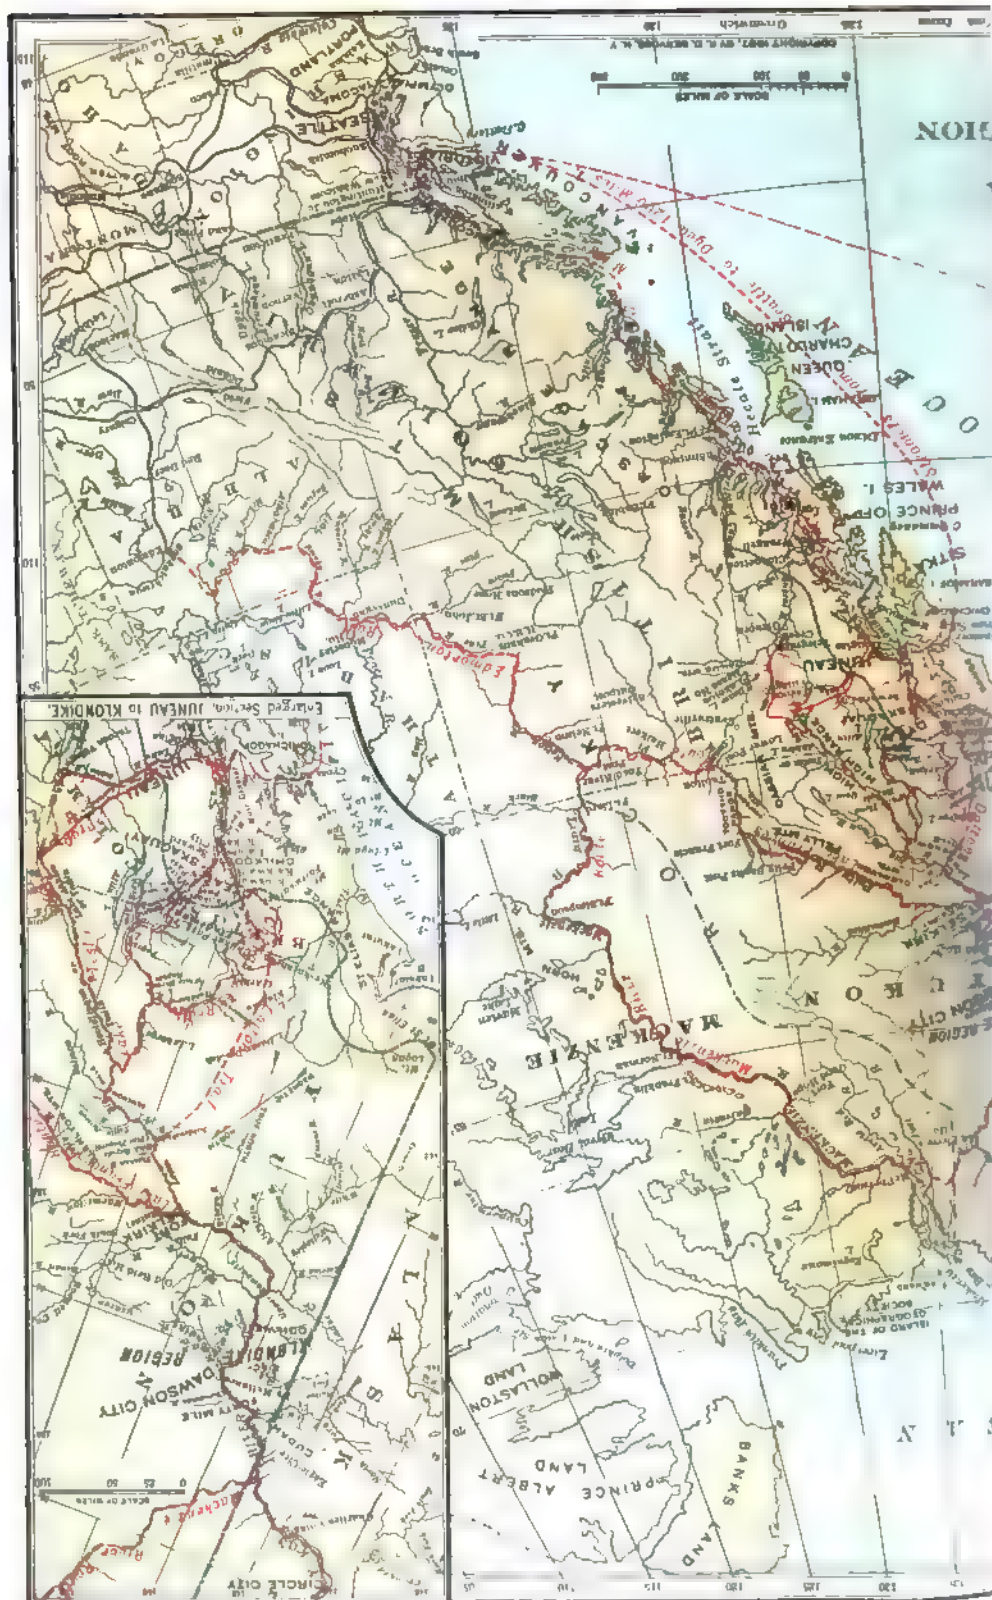

Topography.—Officials of the United States Coast and Geodetic Survey continued their work during 1898, with many valuable results. Prof. George Davidson completed the first authentic map of the Copper river region, showing also Cook's Inlet, the Tanana river and the Yukon. All the tributaries of these rivers are traced and named, the measurements of the numerous capes are given, and the topography of the region, in several instances of a character not previously suspected, is quite fully described. During the summer a surveying party under G. H. Pratt discovered that owing to the incorrect charting of the coast line in the vicinity of the Kusilvak channel the area of the territory is 2,500 square miles larger than has ever been reported.

Industries.—The season of 1897-8 did not yield as large mining results as were expected. The rush to the gold fields continued as great as ever for a while but afterward fell off considerably on both the American and Canadian sides of the boundary. This applies chiefly to the Klondike region. It was expected that American operators there would take out about \$20,000,000, but reports at the close of the year indicated that shipments would scarcely aggregate half of that sum. In some parts prospectors had become so discouraged that they abandoned their search for gold and had located rich coal claims. The region between Cook's Inlet and Copper River is believed to be full of coal veins of excellent quality. Large ledges of copper and gold ore were reported as having been discovered on Gravina, Annette, and Revillagigedo islands in the southeast coast, and promising hundreds of thousands of tons without the necessity for sinking shafts. Prince of Wales Island is now known to contain a great mass of rich ore. E. Hazard Wells, of the War Department, who has traversed interior Alaska in many directions and has a large practical knowledge of the country, declares that there are great deposits of gold in the Territory that rival those of the British Northwest Territory. He is particularly enthusiastic concerning the region through which the Tanana and its tributaries flow.

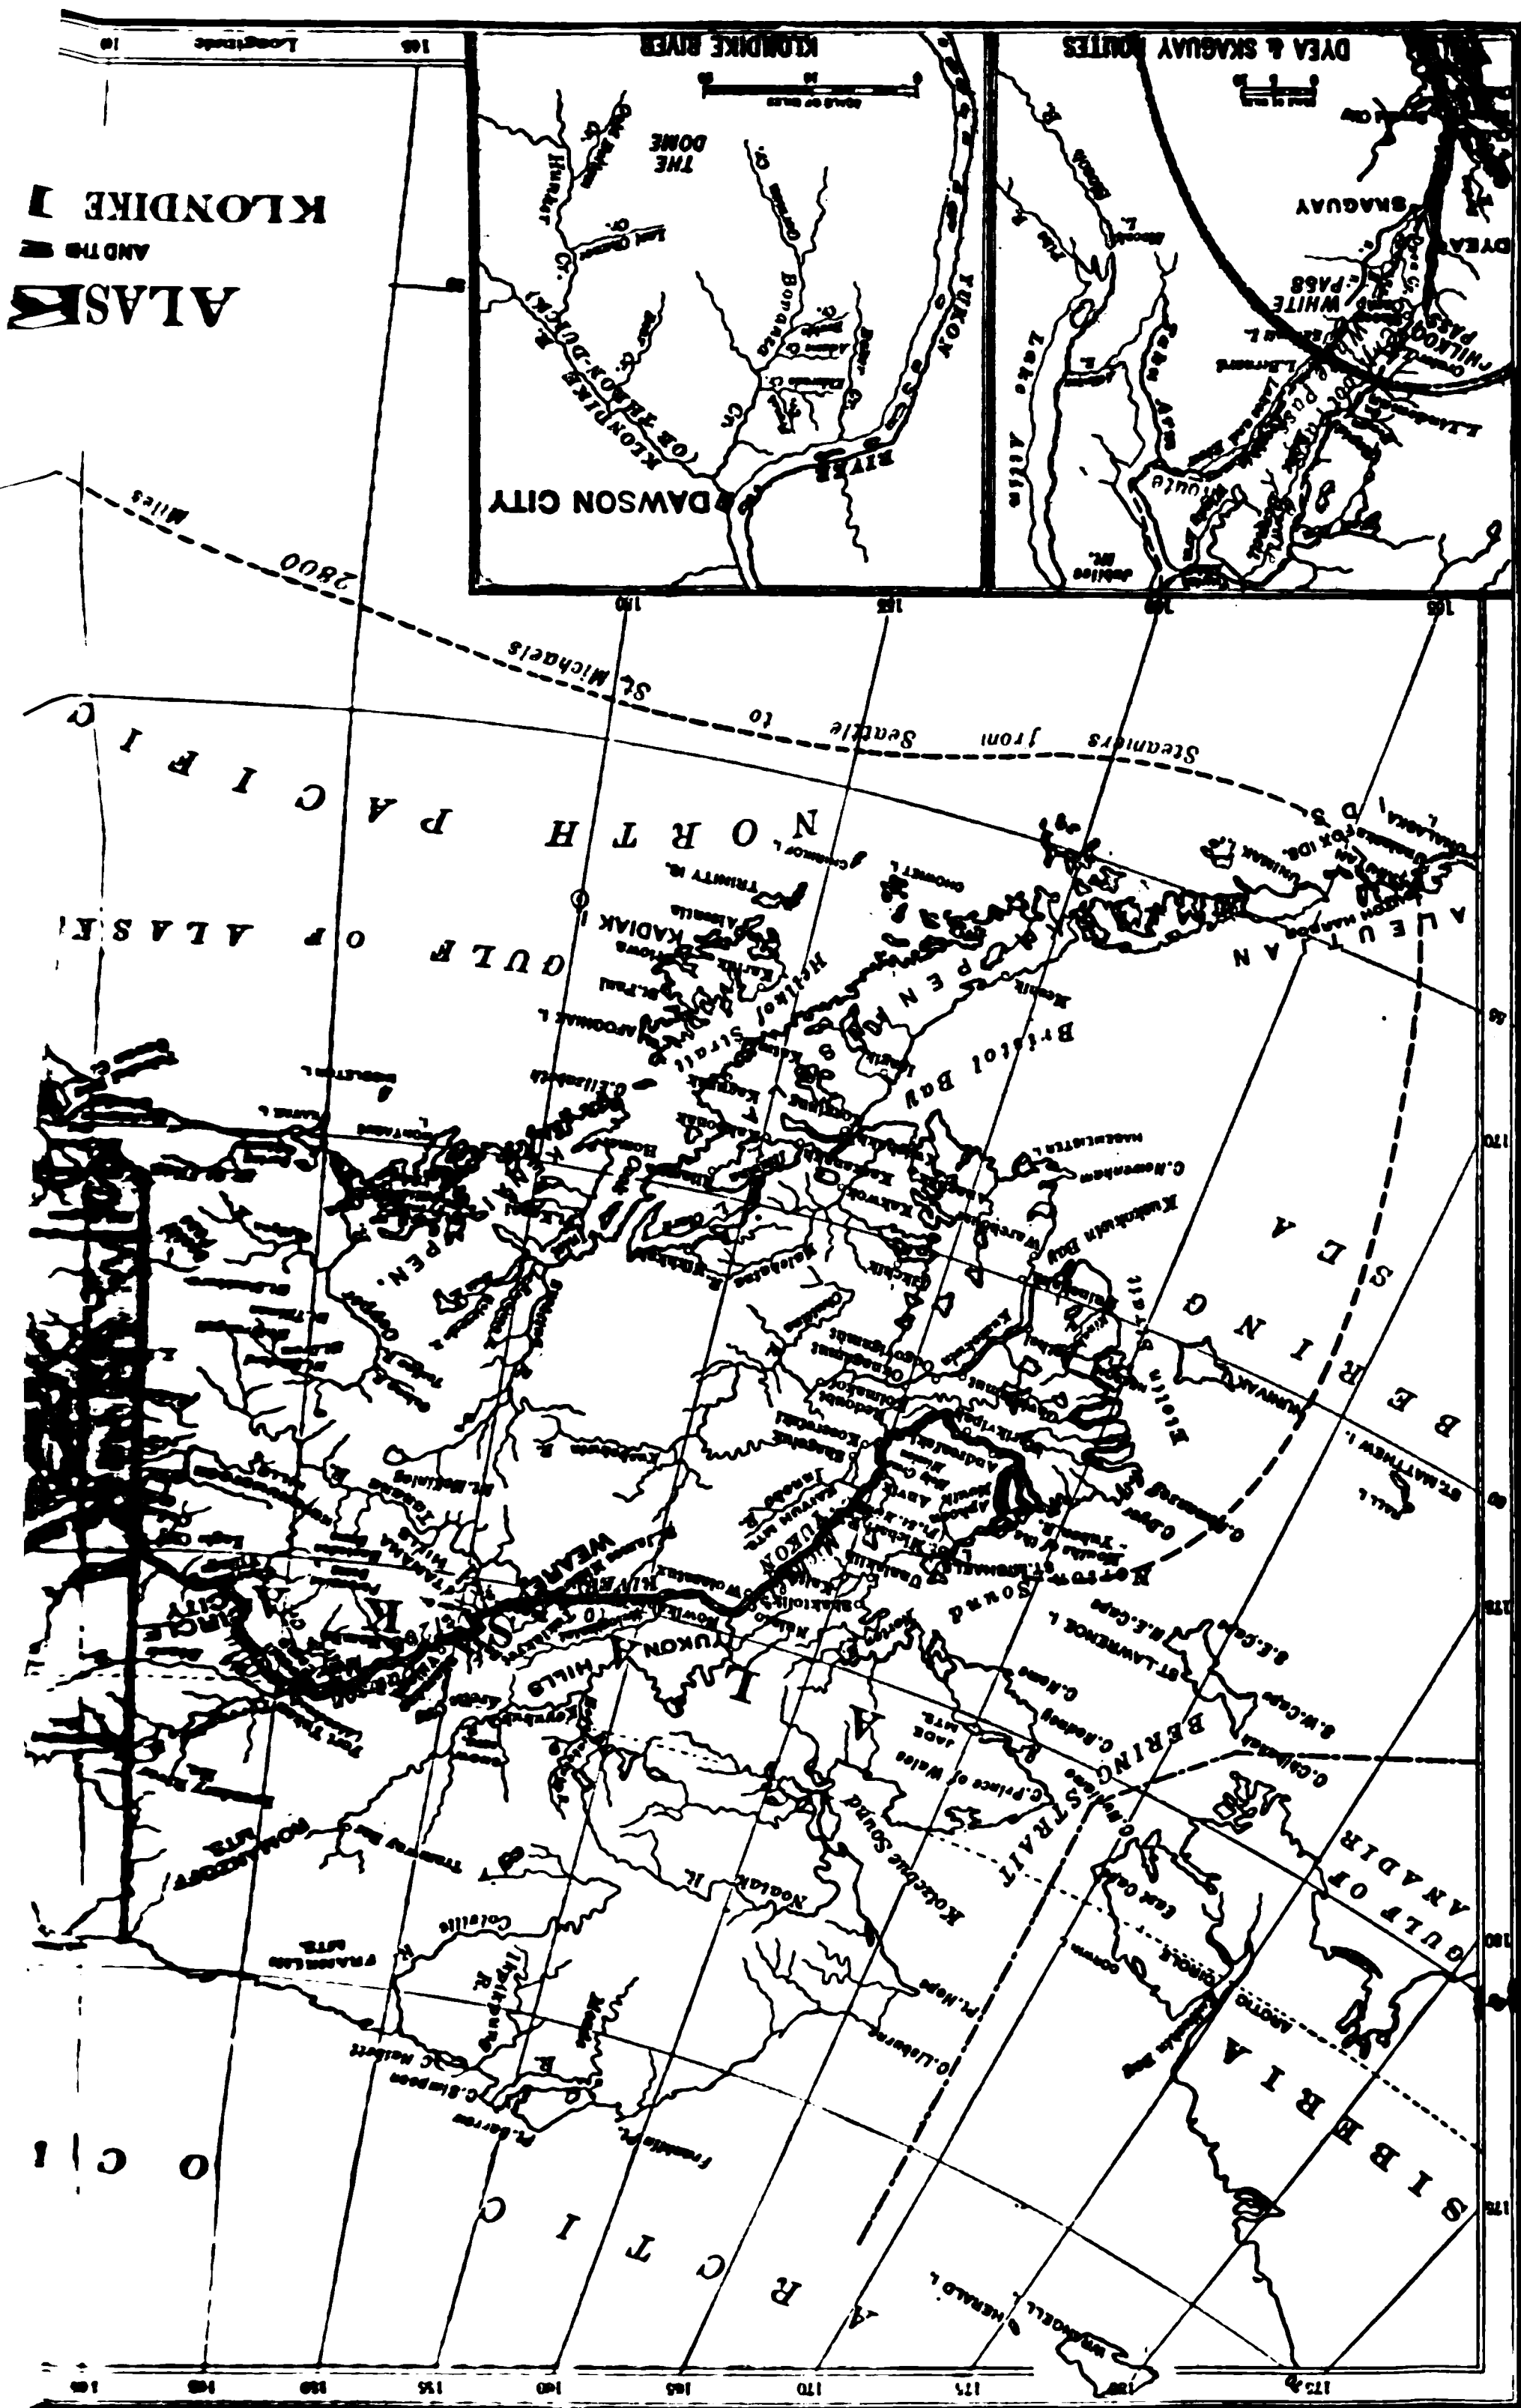

During the year new gold fields were discovered in American territory between Big and Little Skookum, Fresno Creek, and on Monte Cristo Island. Farming has been found to be impracticable throughout most of the territory, but Catholic missionaries have established an agricultural station.

Along the coast at Juneau, Sumdum, Seward, Douglass and Admiralty Islands, and other points, "deep," or "quartz," mining is well established. The rock is of the post-Jurassic and Tertiary ages while that of the Yukon Valley is much older, being probably pre-Paleozoic and in part perhaps Archæan. Geologists assume the presence of gold in all that part of the Dominion north of British Columbia and west of the Yukon-Mackenzie watershed, except the part north of the intersection of the Yukon and the 141st meridian. It can safely be said that there are at least 3,000 miles of stream and gulch in the upper Yukon district that can give good returns for placer mining. The richest part hitherto known is near the Klondike, sixty miles east of the American boundary. It has been estimated that the immediate region of Bonanza and Eldorado Creeks (both of which are in the little Klondike basin) will yield \$75,000,000. It should be said, however, that there are many claims in this very region that scarcely pay for the working. Quartz mining in the Yukon district, owing to the great difficulty attending it, has hardly yet been begun; but Mr. William Ogilvie, the Dominion Surveyor in the Yukon district, reports that the gold-yielding quartz is inexhaustible.

The method of placer mining is to sink a shaft to bed rock, the depth varying from 4 to 30 feet. Usually a miner strikes first a thick stratum of frozen muck. This he thaws with wood-fires, the soil being alternately thawed and removed until the frost limit is passed. Beneath the muck is a layer of rubble usually of 3 or 4 feet, then a thin layer of dirt or clay, and beneath this, lying on the bed rock, is the streak of nuggets and gold flakes. From the bottom of the shaft tunnels are driven in various directions to the limits of the claim. The labor of burrowing the "levels" by the light of a lantern is great though for the time the miner is sheltered from the icy winds. The "pay dirt" is heaped until summer and is then washed until only the heavy dust and nuggets remain.

ALASKA
AND THE
KLONDIKE

Dr. George M. Dawson, Director of the Canadian Geological Survey, says that placer mining on the Klondike is likely to continue for a number of years, the greatest output probably being in 1899, and that meanwhile the country will be filled with prospectors, and other mining districts, though perhaps not as rich as the Klondike, will be worked. Quartz mining will probably be developed and conditions will become more favorable for continued and comfortable residence.

On October 31, 1898, Alaska had one national bank, with a capital \$50,000, circulation \$2,350, and deposits \$49,368.

Communications.—The all-water route to the Klondike is 2,705 miles from Seattle to St. Michael and 1,313 miles up the Yukon to Dawson, the voyage taking about seven weeks. The most feasible land routes start from the head of the Lynn Canal. Dyea is 1,115 miles from Seattle and the Dyea, or Chilkoot Pass, route leads 527 miles northwest to Dawson. The Skaguay, or White Pass, route is somewhat longer and more difficult than the Chilkoot. The Dalton route, which crosses the Chilkoot Pass, joins the others at Fort Selkirk. Hitherto the Chilkoot route has been the most popular, but it is probable that in the future the Teslin route will prove the most advantageous. This route, starting from Fort Wrangel, leads up the Stikine and down the Hootalinqua Rivers. The proposed railway connecting the Yukon district with the Canadian system is a present impossibility.

Early in 1898 the aerial railway over Chilkoot Pass to Lakes Linderman was completed. This unique enterprise shortened the time between tidewater and the headwaters of the Yukon river from a month to a day, and removed the perils and hardships of former travel. The Canadian government has selected five routes for railways into the Yukon region, which possess an interest to Americans because their seacoast outlets are in the territory of the United State. Four of these as projected will cost upward of \$15,000,000.

The first railroad built in Alaska is the White Pass and Yukon, which is projected from Skaguay to Fort Selkirk. By November 1, 1898, this was in operation as far as Summit, which is about sixteen miles from Skaguay and at the highest point of the divide. On October 5, work was begun on the Canadian section of the line. It was thought that by the middle of February, 1898, the road would be in operation as far as Log Cabin, thirty miles from Skaguay.

Discoveries on the Coast.—In October 1898, John F. Pratt, in charge of a party of the Coast and Geodetic Survey, consisting of fifty men under six officers, who discovered the above-mentioned error in the chart, reported that a new channel for Yukon-bound vessels had been found. The discovery of the new channel will save from 400 to 500 miles in reaching the Yukon. Hitherto, vessels have had to proceed outside the long bar extending along the coast, at an average distance of twenty-five miles, to St. Michael, transship there to small boats which crawl along the coast a hundred miles below to the Aphoon Channel which is only two feet on the bar at low tide. Referring to the new channel the report says: "The Kusilvak Channel extends very nearly parallel with the shore until about half way to the Krypniak, when it turns seaward, and when beyond the sight of land spreads out into a bar with from six to eight feet on it at low tide. On each side the flats are irregular, with blind pockets, etc. The shores in the vicinity of Kusilvak mouth are about twenty-five miles further out into Behring Sea than indicated on the published charts. In round numbers this difference includes an area of about 2,500 sq. m. . . . It is now a foregone conclusion that the passenger business of the upper Yukon country is and will remain via the passes, while for a long time the great bulk of the freight will go via the river's mouth. There are now between 60 and 70 regular river steamers in the carrying business and still freight was left behind at St. Michael when the season closed in. The ocean traffic has been proportionate, there being as many as 30 deep-water vessels at anchor in St. Michael anchorage at a time, the average during the season being twenty. The greatest stumbling block in the St. Michael freight business is the transfer from ocean to river craft in an unprotected roadstead, the water depth being such that ocean steamers do not anchor within about two miles of the nearest shoal water landings. If next year's examinations should develop the fact that somewhere in Scammon Bay the shores were bold enough to enable sea-going vessels to discharge at docks, then by artificially marking the Kusilvak entrance so that it could be readily found, the cost of freight transportation could be sensibly lessened."

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise into Alaska were valued at \$134,974, and the exports were valued at \$30,705—an increase in both cases. Much of the trade to and from the territory is entered at the customs districts of Puget Sound and San Francisco and is accredited to them.

Education.—At the close of the school year 1896-7, there was an estimated school population of from 8,000 to 10,000, of whom 1,395 were enrolled in the twenty government schools in operation during the year. The total amount available for the support of these schools was \$36,500. For three years prior to 1892-3 the govern-

ment annually appropriated \$50,000 for public education in Alaska; since that year the amount has been \$30,000. In 1898 the Secretary of the Interior Department and the Governor of the Territory earnestly recommended an appropriation of \$60,000 because of the increase in population and towns and villages. There were 17 public school buildings, which had cost \$26,536. About 25 native children were being educated at the Carlisle Indian School, Pa. The Presbyterian, Moravian, Congregational, Baptist, Methodist Episcopal, and Protestant Episcopal Churches and the Swedish Mission Covenant maintained religious and educational missions. The periodicals comprised a monthly and six weekly papers.

The difficulties under which education progresses in Alaska are well illustrated by the experiences of Miss Fulcomer, the teacher of the public school in Circle City. "I arrived here on August 17, 1896, finding no school building ready for me and not a vacant house in town in which I could open the school, consequently I was obliged to wait, impatiently, until October 1, when the building was under roof; then I opened my school in spite of the fact that the windows were not in and the doors were not hung. The men worked, off and on, while I was teaching, but it was not until December 12th, that the work stopped. Since that time the house has been as snug and comfortable as any place in town. During the winter nearly all the men in town left for the new gold diggings at Klondike where they were more successful than they were here. When the ice ran out of the Yukon the third week in May, these men came down the river, packed up their belongings and moved to Klondike with their families. This is one reason for the sudden decrease in the school attendance during May. The other reason is that, at last, spring sunshine had come. For seven months it had been so cold and stormy that the children could have no out-of-doors play life. In May the weather moderated, the sun shone warm and bright, the snow began to melt, ducks, geese and song birds slowly came, and the children were fairly wild to be out of doors. It seemed almost as much of a sin to keep them in the house as it does to keep our faithful farm animals shut in the dim musty barn and feed them on dry hay. Many native children dropped out and I did not blame them. However, I kept on with an attendance of eleven and twelve pupils. But it suddenly grew intensely hot; all kinds of bugs and worms began to wake from their winter's sleep and came crawling out of the moss filling the chinks between the logs—bees, hornets and our terrible pest mosquitoes. With such visitors as these the children could not study; so, before long we had to stop school. Teaching school in this far north land is altogether different from teaching in the States, and the teacher is at times compelled to change the usual order of things and use her own judgment, depending on the Department's having faith enough in her to sanction such changes. For nearly three months during the winter the people want to hibernate. They can not help it, for there seems to be something in the air tending to that result. The days are so short that the people sink into a kind of stupor, not wanting to rouse up when daylight comes, even though that be delayed until eleven in the morning. During these dark months I was always at the school before half-past nine, but was usually alone there until half-past ten, when the children would straggle sleepily in, some without breakfast. By noon all would be there."

History, 1898.—The rush of miners who knew nothing of the severities of the climate entailed considerable suffering; and early in the year the reports were so alarming that the government organized a relief expedition with some six hundred reindeer, but on more re-assuring advices this was abandoned at the beginning of March. The majority of miners seek the gold fields by crossing the mountains, and the dangerous White and Chilkoot Passes have been the scenes of many disasters. On April 3, avalanches in the Chilkoot overwhelmed more than a hundred travellers. Exploring parties under the government have sought other routes wholly within American territory; among others via the Copper River. It is variously estimated that from 50,000 to 100,000 entered the Yukon Valley during the open season of 1898. The greatest difficulty of the journey is occasioned by the 1,500 pounds of luggage which each prospector ought to take with him, for the Indian guides have exorbitant charges and are very unreliable. The luggage consists of wearing apparel, a year's provisions, mining and carpentry tools, and sometimes a boat in sections. The rapid development of Alaska has necessitated many judicial and legislative changes. Governor Brady, in his annual report for 1898, made a strong plea for Congressional action on Alaska's needs and urged a speedy granting of citizenship to Alaskans. Much legislation for the territory was projected during the year. In Congress the House favored the granting of rights of way to railroads, and in May adopted the conference report on the bill extending the homestead laws to Alaska. The bill provided that no homestead exceed 80 acres at \$2.50 an acre; that tracts of land along the water front of any stream, inlet, bay, or sea shore for landing places, for canoes and other craft used by natives, be reserved; that the Annette and Pribilof Islands and the islands leased or occupied for the propagation of foxes also be excepted. The Treasury Department issued regulations governing the transportation of mer-

chandise from American customs ports to the British Northwest Territory. The Senate Committee on Territories reported favorably a bill providing a new form of government, which would enlarge the powers of the governor, create a civil and judicial district with three divisions, covering the territory, extend to it the Federal mining laws, and, as far as applicable, place the territory under the general laws of the State of Oregon. During the year 1898 the chief interest lay in exploration and mining. Early in February the increase of lawlessness in the territory decided the Cabinet to send four companies of the Fourteenth Infantry to Dyea and Skaguay. About the same time the treasury issued regulations governing the entry and transportation of merchandise for the Klondike region by way of Juneau, Dyea, Skaguay, and other ports in Alaska. Goods for the Klondike may be forwarded without payment of duty in charge of a customs' officer at the expense of the importer, or upon the filing of a bond for its exportation equal to the duties and charges. All imported animals or merchandise abandoned or sold *en route* will be seized and forfeited to the government unless the duties are paid thereon. All articles carried by passengers which are in use are exempt from duty. Regulations were also issued concerning the navigation of the Yukon and Porcupine Rivers and their tributaries, providing that the transfer of cargo and passengers from a river or sea-going vessel from a port in the United States except another port in Alaska, or from any foreign port, to a vessel destined by way of the mouth of the Yukon or Porcupine River, shall be permitted only at the port of St. Michael, under the supervision of customs' officers. The long pending disputes between the United States and Great Britain, the latter acting on behalf of the Dominion of Canada, over the boundary between Alaska and the British possessions and the fur seal and other fisheries, were referred to a Joint High Commission, appointed by the United States, Great Britain, and Canada in 1898 to negotiate a settlement of all cause of controversy between the United States and Canada. The Commission held sessions in Quebec and Washington, but had not completed its work at the end of the year. (See CANADA, paragraph Anglo-American Commission.) On October 14 Dawson City was partly destroyed by fire; the loss was estimated, on account of the enhanced value of property, at \$500,000. The following laws, made by the Canadian government, are observed for placer mining in the upper Yukon district: For "bar diggings" the claim is a strip of land 100 feet wide at high-water mark and extending along the river to its lowest water level—"bar diggings" meaning any part of a river over which water extends in flood season, but not as low water. For "dry diggings"—mines over which a river never extends—the claim is limited to 100 feet square. "Creek and river claims" are 500 feet in length, measured along the stream, and extend from base to base of the hills on each side; except that when the bases are more than 600 feet apart the width is limited to that size, and when the bases are less than 100 feet apart the width may be extended to 100 feet. The corners of all claims must be marked by posts on one of which is the name of the owner of the claim. Within sixty days a claim must be recorded at the nearest law office; a fee of \$15 is required for registry and an annual fee of \$100 thereafter. See COAL.

ALCOHOL. *Alcohol Consumption in the United States.*—A marked decline in the alcohol consumption in the United States is reported, amounting since 1888 to about 30 per cent. In other words the total consumption of alcohol in the United States is one gallon per capita less than in 1888, the total consumption having fallen off about 70,000,000 gallons since that date.

Alcohol in Therapeutics.—In the last published annual report of the Commissioners of Public Charities and Correction for the City of New York, which gives the facts and figures for 1893, the cost of liquors consumed and the death in the various hospitals under the control of the Commissioners suggests an interesting relationship: Following is the table compiled from the report:

HOSPITAL.	Number of patients.	Cost of liquors.	Deaths.	Cost of liquors per patient.	Percentage of deaths.
Fordham.....	383	\$274.38	44	\$0.72	11.49
Gouverneur.....	3,025	124.09	279	.41	9.22
Bellevue.....	16,141	2,969.75	1,592	.18	9.86
Harlem.....	2,842	356.53	130	.12	4.87
City (Charity).....	8,075	824.63	675	.10	8.35
Ward's Island.....	6,529	338.83	399	.05	6.11

There is a widespread feeling among physicians, frequently expressed during 1898, that alcohol is useful to a very limited extent as either food or stimulant.

Alcohol and the Russian Death-rate.—As a result of official inquiry, it is reported

that the Mohammedan Tartars of Kazan, who abstain from alcoholic indulgence, have a rate of mortality of only 21 per 1,000, while the death-rate of the Orthodox Russians of the same locality who indulge freely in alcohol but otherwise live under the same general conditions as the Tartars, is 40 per 1,000.

Alcohol Consumption in Various Countries.—In the *Lyon Médical* for December 4, 1898, Debove computes the average consumption of alcohol by the individual (man, woman and child) as follows: France, 14 pints; Belgium, 10.5 pints; Germany, 10.5 pints; British Isles, 9.25 pints; Switzerland, 8.75 pints; Italy 6.60 pints; United State, 6.10 pints; Sweden, 4.50 pints; Norway, 3 pints; Canada, 2 pints.

Influence of Experimental Alcoholism on Immunity.—Deléarde, of Paris, has been experimenting with tetanus and anthrax, and has found that animals treated with alcohol after they had been vaccinated, lost their immunity; if treated with alcohol during the vaccination period they acquired immunity with difficulty; if the vaccination was begun after the treatment with alcohol it was only successful if the latter was stopped at the beginning of the vaccination. In the case of anthrax it was impossible to immunize animals while they were being treated with alcohol.

ALEXANDER THE GREAT. See ARCHÆOLOGY (paragraph Babylonia).

ALEXANDRIA is the port of Egypt. It has increased greatly in recent years, both in population and in trade. In 1882 the population was 208,755, including Arabians, Turks, Jews, Copts, Greeks, and Franks. According to the census of June 1897, its population was 319,766. A new entrance to the harbor thirty feet deep was completed in July 1894, and navigation has been greatly facilitated by the building of docks, wharves and quays. In 1896 2,132 vessels arrived and 2,105 cleared. The tonnage of that year was 2,123,591 entered and 2,094,684 cleared, the tonnage of British vessels surpassing those of any other nation although the greatest number of vessels belonging to any one country were Turkish. In recent years Alexandria has exported large quantities of cotton and cotton seed, cane sugar, onions and maize, and its imports have comprised among other articles, cotton cloth, leaf tobacco, coal, iron, coffee, meal, starch and indigo. The Archæological Museum, which was opened at Alexandria on September 30, 1895, contains valuable collections, especially of coins.

ALPHONSO XIII, King of Spain; of the House of Bourbon, the posthumous son of Alfonso XII, was born May 17, 1886, and was enthroned December 1, 1887. His mother, the Queen-Regent, who was the Archduchess Maria Christina, daughter of Archduke Charles Ferdinand of Austria, is a woman of extraordinary tact and good sense. Ruling a country whose race, traditions, and language are not her own, she has won the love and admiration of the Spanish people for whom she has trained her son, the king, with the greatest care and devotion. The king has two sisters. Alfonso is a remarkably delicate child, but his health improves as he grows older.

ALGÆ. See BOTANY.

ALGER, RUSSELL ALEXANDER, Secretary of War in the McKinley Cabinet, was born in the township of Lafayette, Medina county, Ohio, February 27, 1836. By working as a farm hand he enabled himself to attend the Richfield Academy (Summit county, Ohio) during fall and winter terms; taught school two winters; studied law with Wolcott and Upson, Akron, Ohio, and in 1859 was admitted to the bar. He did not practise in his profession long, but, removing to Michigan in 1860, went into the lumber business on borrowed money. In September, 1861, he enlisted as a volunteer and the following month was mustered in as captain in the Second Michigan Cavalry. He was promoted to the rank of major, became lieutenant-colonel of the Sixth Michigan Cavalry, and in June, 1863, colonel of the Fifth Michigan Cavalry. At the battle of Boonsboro, Maryland, he was severely wounded, July 8, 1863; he was brevetted brigadier-general and major-general for "gallant and meritorious services" during the war; resigned from the service September 16, and was discharged September 20, 1864. He returned to Michigan and again with borrowed capital engaged in lumbering; he finally owned various extensive business interests both in Michigan and in other States. During 1885 and 1886 General Alger was Governor of Michigan, and on several occasions he has been recognized as a presidential possibility. On March 3, 1897, he was appointed and confirmed Secretary of War in President McKinley's Cabinet. During the latter part of the Spanish-American War and during the weeks immediately following the signing of the protocol (August 12), General Alger received severe criticism at the hands of the public and the newspaper press for alleged gross mismanagement and negligence in the War Department. It is doubtless true that the volunteers, as a rule, enlisted without adequate knowledge of the necessary hardships, including privations and disease, of camp life. Conditions however, seemed to be needlessly grievous. The unsanitary state of camps, the overcrowding of transports, the insufficiency of medicines and physicians, and the incompetency of many subordinate officers, caused a popular cry to be raised against General Alger and his department, and it was frequently suggested that the Presi-

dent ask him to resign the portfolio. He remained in office, but the President appointed a committee, without the power of subpoena, to investigate the alleged mismanagement of the department.

ALGERIA is governed by a civil governor-general who is in constant communication with the French executive department. He is the chief executive, but the departments of finance, worship, justice, instruction, and customs are under separate ministers, and a strip of territory in the Sahara is governed by military authorities under the direction of the governor-general. The census of 1896 gave for the three departments of Algeria a total population of 4,429,421. The area is 184,474 square miles. The Algerian Sahara is estimated to contain about 123,500 square miles with a population of about 50,000. Considering the fact that Algeria has been governed by France for more than sixty years, the French element is surprisingly small. In 1896 there were only 318,127 French inhabitants, while the other foreign residents exceeded these in number by over 100,000. The commerce of Algeria is for the most part with France and her colonies. It has shown no marked tendency to increase in recent years. In 1896, the "general" commerce of Algeria was for the imports 275,798,595 francs, and for the exports 247,409,742 francs. The "special" commerce in 1896, including imports for home use and exports of home produce, was for imports from France 269,237,968 francs, and for exports to France 231,074,677; and for imports from foreign countries 51,436,012, and exports to foreign countries 34,233,031. The carrying trade is largely in the hands of other countries than France. The railway mileage, which was in 1895, 1961, amounted in 1897 to 2,156. The main sources of revenue have been direct taxes, customs, registration, stamps, etc., and monopolies, and the main items of expenditure have been set down under the heads of the ministries of the interior, public works, justice, worship, and instruction. The chief part of the population is engaged in agriculture and the principal cereals raised are, in the order of their importance, barley, wheat and oats. In the mines, iron, zinc, lead, mercury, copper and antimony are obtained. Petroleum is found in Oran and there are phosphate beds in several parts of the country.

ALLEN, CHARLES HERBERT, Assistant Secretary of the Navy, succeeded Theodore Roosevelt in that position in May 1898. Mr. Allen was born at Lowell, Massachusetts, April 15, 1848; was educated at the Lowell High School and at Amherst College, being graduated from the latter seat of learning in 1869. He received from Amherst College three years afterward the degree of M. A. His political career began in Lowell where he engaged in mercantile pursuits and held various local offices. In 1881 and 1882 he was elected to the lower house of the legislature and the next year was sent to the State Senate and was subsequently appointed a colonel on Governor Robinson's staff. He was elected to the XLIXth and Lth Congresses by large majorities and then declined further nominations; but in 1891 was nominated for Governor of Massachusetts and was defeated by the late William E. Russell, of Cambridge. He was not in public life from that time until his appointment to the Navy Department. For many years he has been an intimate friend of Secretary Long. Mr. Allen is recognized as a man of much ability, but he entered the Department with no experience. He is a member of the Union Club of Boston and the University Club of New York.

ALLEN, JAMES LANE, American author, born near Lexington, Ky., in 1850. He was graduated at Transylvania University. The novels which have placed him in the front rank of American authors are: *Summer in Arcady* (1896), and *The Choir Invisible* (1897). In 1898 he was at work on a new book to be entitled *The Mettle of the Pasture*.

ALLIANCE OF THE REFORMED CHURCHES, an organization of ten Reformed and Presbyterian Churches in the United States. These are: The Presbyterian Church (North); the Presbyterian Church (South); the United Presbyterian Church of North America; the Reformed Dutch Church; Reformed German Church; Reformed Presbyterian Church; Associate Reformed Synod of the South; Synod of Reformed Presbyterian Church; and the Welsh Presbyterian Church. The number of communicants in these ten churches is 2,080,541, with a total constituency of 7,000,000. The Presbyterian Church in Canada, with a constituency of 600,000, and more than 80 different denominations from other continents, with a constituency of about 23,000,000, also belong to this Alliance. The Seventh General Council of the Alliance will be held in Washington, D. C., Sept. 27 to Oct. 6, 1899. The presiding officer will be Rev. J. Marshall Lang, D.D., pastor of the Barony Church, Glasgow, Scotland; and Rev. Wallace Radcliffe, D. D., pastor of the New York Avenue Church, Washington, D. C., will be chairman of the Committee of Arrangements. The Alliance is conducted by the Executive Commission, which held meetings in 1898 in Philadelphia, and St. Louis. The next meeting will be in Richmond, Va.

ALLMAN, GEORGE JAMES, M. D., LL.D., F. R. S., prominent zoölogist, emeritus regius professor of natural history at the University of Edinburgh, died November

24, 1898. He was born in Ireland in 1812; was graduated at Trinity College, Dublin, in 1844 and the same year became regius professor of botany in the university. In 1855 he accepted the chair of natural history at Edinburgh; resigned in 1870 and four years later became President of the Linnean Society. He was the recipient of various gold medals from the scientific societies, and in 1878 was honored with an LL.D. from Edinburgh; the next year he became President of the British Association. Among his publications are the monographs on *Fresh Water Polyzoa* (1856), and *Gymnoblasic Hydroids* (1871-72).

ALMA-TADEMA, LAWRENCE, painter, born at Dronryp, in the Netherlands, Jan. 8, 1836. He studied for a learned profession, but in 1852 went to Antwerp to study art. Since 1864, he has obtained medals, honors, and distinctions of all kinds. For many years he has lived in London. He was made R. A. in 1879. Some of his best works are owned in America, among them "Sappho" and "Reading from Homer." The "Conversation of Paula" (1898), is said to be his crowning production. (See PAINTING.) His wife is an accomplished painter and won a gold medal at Berlin in 1896; and his daughter Anna Alma-Tadema, took a second medal in the Paris Exhibition, 1889. Miss Lawrence Alma-Tadema, another daughter, has published *Love's Martyr*, *The Wings of Icarus*, *The Crucifix*, and *Realms of the Unknown* (poems).

ALSACE-LORRAINE constitutes the Reichsland or Imperial Land, the law of June 9, 1871, having declared that it should be forever united with the German Empire. The constitution of the German Empire was definitely introduced into Alsace-Lorraine on June 1, 1874. Its administration is under a governor-general, known as *Statthalter*, appointed by the Emperor. The seat of government of the *Statthalter* is at Strasburg. He is assisted in the government by a ministry of four departments, together with a Council of State. On October 30, 1894, Hermann of Hohenlohe-Langenburg, was appointed *Statthalter* in place of Prince Hohenlohe-Schillingsfürst. The new *Statthalter* followed the policy of his predecessor, trying so far as possible to propitiate the discontented element in the population. Nevertheless the opposition to German rule continued, being constantly stimulated from France, and measures were taken to restrict the press. In 1894 a notable reform was made in the administration of the communes, giving the latter a greater degree of local independence. Efforts were made to promote trade and industry in the country and an industrial exhibition was held in Strasburg in the summer of 1895. In 1898, when the Czar's peace manifesto was under discussion, a great deal was said about the opposition in France to any measure looking to permanent peace unless the Alsace-Lorraine question should be settled in a manner favorable to the French.

ALUMINIUM. The production of aluminium in 1898 amounted to 2,600 short tons as against 2,000 in 1897, and was controlled in the United States by one company which had an extensive plant at Niagara Falls. The principal directions in which the use of aluminium has increased in 1898 have been for electrical conductors, and in replacing zinc and brass in many of their ordinary applications.

The chief ore of aluminium is bauxite, the deposits in Georgia and Alabama continuing to be the source of this metal in the United States, although deposits are known to occur in Arkansas; those in Georgia and Alabama extend from Adairsville, Ga., to Jacksonville, Ala.; they do not form one continuous bed, but are found in lens-shaped masses whose geological position is immediately over the Knox dolomite, the bauxite having been derived from the Connasauga shale, which underlies the dolomite. All the deposits are located between 900 and 950 feet above sea level. The ore varies in character from a white clay to a pebbly mass, whose structure is known as pisolitic. The average composition of high grade ore is: Alumina, 61.68 per cent.; ferric oxide, 1.20 per cent.; silica, 2.10 per cent.; water (combined), 31.45 per cent.; total, 96.43. In addition the bauxite frequently contains several per cent. of titanitic acid. Heretofore one of the great obstacles to the more extended use of aluminium has been the difficulty encountered in attempts to solder this substance with copper. A German engineer, Wechnitz, has succeeded in plating aluminium with copper, by a welding process, in any desired thickness, and this even in the finest sheets allows of no separation when rolled or drawn. It is furthermore stated that the plated sheets can be easily soldered, grooved, tinned and nicked. This is an important discovery since the greatest obstacles to the wider use of aluminium have been its poor ability to solder, its weak power of resistance to numerous fluids, and the fact that paint does not adhere to it well.

ALVARY, MAX, German operatic tenor, who sang during many seasons in America, died at his home in Tabarz, Thuringia, Germany, November 7, 1898. Alvary was a stage name, his father being the well known scene painter, Andreas Achenbach. He was born at Düsseldorf in 1857. He sang somewhat when a youth, when he was known as a light tenor; subsequently, after leaving the university, where he did not finish the course, and after having become an architect and business man, he devel-

oped a strength of voice, under the direction of Lamperti in Dresden, and Julius Stockhausen in Frankfurt, that gave him a very high place among high class heroic tenors. His first appearance was made at Weimar in 1882; soon after he appeared in New York as "Don José" to Mme. Lilli Lehmann's "Carmen." From that time his success was assured, his popularity increasing until 1889 when he appeared as "Siegfried," which proved to be his master rôle. For this performance he was complimented on every hand, and no one praised him more than did M. Jean de Reszke, who, though perhaps superior to Alvary as a singer, is thought by some to lack the latter's natural adaptation to the part of "Siegfried." Alvary made several extended visits to America, his last public appearance being in the spring of 1896, when he sang in New York with Katherine Klafsky, under the direction of Mr. Walter Damrosch, with whom he had previously been associated. He enjoyed marked success in Europe. After leaving New York in 1891, he went to the Stadt Theatre in Hamburg, and, it is said, remained a member of the company as long as he could sing. Among the rôles in which he appeared are "Adolar" in *Euryanthe*, "Alvarez" in *Cortes*, "Merlin Assad" in *The Queen of Sheba*, "Loge," "Faust," "Walther," "Tannhäuser," and "Tristan." But he will be best remembered for his magnificent rendering of "Siegfried." Alvary, who was a man of much personal beauty, was always in his best days "dramatic, graceful, un-selfconscious." He was a conscientious artist, and, though by no means superficial, gave much care and attention to the minute details of his rendering. He is said to have had a singularly "simple, cheerful nature." In the latter part of his life, it is said, he was financially in very straitened circumstances. His wife and a number of children survive him; to him and Frau Alvary there were born thirteen children, some of whom are now dead.

AMERICA, FLORA OF. See BOTANY (paragraphs Systematic Botany, North America, South America, Ecology and Plant Geography).

AMHERST COLLEGE, at Amherst, Massachusetts, was founded in 1821. It is non-sectarian and for men only. In 1898 the professors and instructors numbered 36 and the students 380; the fellows and resident graduates numbered, 4; seniors, 89; juniors, 77; sophomores, 88; freshmen, 122. The following degrees were conferred at the commencement in June: B. A., 54; B. S., 31; M. A., 9; LL. D., 2; D. D., 1. The president, Merrill E. Gates, LL. D., tendered his resignation June 8, 1898, to take effect in April, 1899; President Gates was absent during the year beginning in April 1898, the executive duties being assumed by Dr. Edward Hitchcock, M. A. The college had in 1898 a permanent investment of \$1,402,404 and a beneficiary fund of \$240,000. The following departments were reorganized and enlarged: English Language, Rhetoric, and Public Speaking; French; German; and Biblical Literature; a new department of Modern Governments was instituted. In March 1898, the college suffered the loss of Henry Allyn Frink, professor of logic, rhetoric and public speaking. See Table under UNIVERSITIES AND COLLEGES.

AMICIS, EDMONDO DE. See ITALIAN LITERATURE (paragraph Fiction).

AMMEN, DANIEL, rear-admiral, U. S. N., (retired), died in Washington, D. C., July 11, 1898. He was born in Brown county, Ohio, May 15, 1820. He entered the navy in 1836; was executive officer of the frigate *Roanoke* during the Civil War; commanded the gunboat *Seneca* November 7, 1861, at the capture of Port Royal, where he distinguished himself. He was engaged in all the operations under Admiral Dupont on the South Atlantic coast, commanding the monitor *Patapsco* at Fort McAllister in March, and at Fort Sumter, April 7, 1863, and the *Mohican* during the two bombardments of Fort Fisher. Rear-Admiral Porter recommended him for promotion, and he became captain July 25, 1866. He subsequently became commodore and in 1877 rear-admiral, being retired in 1878. After the Civil War he designed the "Ammen balsa" to facilitate the landing of troops and field artillery on exposed beaches; he also designed a life raft for steamers, and a marine ram which has been adopted by the Navy Department. He published in 1891 *The Old Navy and the New*.

AMMONIA (from Garbage). See GARBAGE.

AMPERE, NEW DETERMINATION OF. See PHYSICS (paragraph Electro-Chemical Equivalent of Silver).

ANÆSTHESIA. *General.*—Schleich, of Berlin, has devised a mixture of chloroform, petroleum, ether and sulphuric ether, to be used for general anæsthesia, by inhalation. With it excitement during introduction is rare, and not marked at any time. There is no collection of mucus in the respiratory passages, no cyanosis. The pulse becomes full and regular, respiration remains unchanged, unless the patient is getting too much of the anæsthetic; then it becomes deep and very rapid. Patients anæsthetized by this mixture awake more rapidly. Half of them will walk home in an hour after recovering consciousness. They vomit much less frequently than when other narcotics are used. In Meyer's (of New York) cases but 44 per cent. vomited.

There is no consecutive bronchitis, no pneumonia. Albuminuria appears in only 4 per cent. This mixture is best administered on an Esmarch's mask, covered with oil-silk, and to which a small funnel has been attached.

Local.—Prof. E. W. Scripture, of Yale University, discovered that anæsthesia of the tissues resulted from sinusoidal electric currents of high frequency, the condition lasting a considerable period after the removal of the electrodes. See *PSYCHOLOGY, EXPERIMENTAL* (paragraph Yale University). Sensation of pain and the perception of cold or heat were abolished. Schleich, of Berlin, who undertook four years ago to devise a method of local anæsthesia that would employ cocain in a safe way and yet render it a competitor of the more dangerous general anæsthetics, was the inventor of the infiltration method. He uses graduated solutions of cocain, morphia and sodium chloride, mixed and injected in small quantities in adjacent areas after the entire surface which is to be the field of operation has been frozen with a spray of ether or ethyl chloride. By this method incision of abscesses, of boils, carbuncles and whitlows has been effected painlessly in many hundred instances, new growths have been removed, bones have been resected, teeth have been extracted and amputations have been made.

Eucain has been used with success in superficial operations, in 3 per cent. to 5 per cent. solutions.

ANAM or **ANNAM**, formerly an empire of southeastern Asia, is now a French protectorate, forming part of French Indo-China. As officially used, the name is applied to an ill-defined strip of territory extending along the coast of the China Sea with an area of 81,042 square miles, and with a population variously estimated at from 2,000,000 to 6,000,000. Since the convention with Siam in 1893 the river Mekong has formed the western boundary. For more than a century France has had relations with this country which at one time included six provinces of Lower Cochin China together with Tonquin, Tsiampa or Champa, and part of the ancient kingdom of Cambodia. The King of Anam formerly acknowledged the feudal overlordship of the Emperor of China. In 1862 he threw himself upon the protection of the French in order to put down a revolt of his Tonquinese subjects. The French wrested from him several of his provinces and continued to encroach upon his territory. In 1883 they decided to assert a protectorate over the land that remained and this plan was carried out by treaty in the following year. The country is fertile, producing rice, maize and other cereals, good timber and a variety of fruits and of vegetable substances useful in the industrial arts and in medicine. Its mineral resources are said to be important and include copper, iron, silver and a small quantity of gold. Raw silk is produced and there are manufactures of earthenware and coarse cloth. The principal exports are sugar and cinnamon. The capital is Hué, with a population variously estimated from 15,000 to 30,000. A garrison of French troops is maintained there. See *INDO-CHINA*.

ANARCHISTS. The anarchists have been active in recent years especially on the continent, but the United States has been comparatively free from their outrages since the famous Haymarket affair in Chicago. France has suffered severely. In 1894 one of the French newspapers published a list of eighteen anarchistic outrages which had been committed in the preceding ten years. It gave also a list of anarchist newspapers published throughout the world. The greatest number of these were published in Germany, France, and Italy. In the United States there were but two and one of these, that which Johann Most issued in New York, recently came to an end. Some of the principal outrages since the beginning of the year 1894 were as follows: Vaillant tried to throw a bomb into the French Chamber of Deputies on December 9, 1893. He was arrested and executed in the following February. Emile Henry was convicted of bomb-throwing in Paris on February 12, 1894, and was guillotined in the following month. Almost at the same time the Barcelona outrage resulted in the apprehension and execution of six anarchists who had been found guilty of an attempt at assassination and bomb-throwing. Next came the murder of President Carnot by an Italian anarchist at Lyons June 24, 1894. In Italy in August of the same year another anarchist confessed to the murder of an Italian editor. In March 1895, an anarchist named Olivieri threatened the life of King Humbert, and on his arrest was thought to be the man who five years before had thrown a threatening letter into the carriage of the Emperor William of Germany while the latter was visiting Rome. In January 1895, the Attorney-General of the province of Milan, Italy, Signor Celli, was murdered by an anarchist. Efforts were made in the different European States to suppress anarchists, and a movement has been set on foot from time to time to form some sort of an international agreement in order to deal more effectually with these criminals. In the United States a law was passed on August 16, 1894, for the exclusion and deportation of foreign anarchists. A good many outrages have been classed as anarchistic, although their connection with that movement has not been proved. In 1897 the list of murderous attacks on prominent people included the second attempt on King Humbert of

Italy, the murder of Canovas del Castillo, the murder of President Borda of Uruguay, and the assaults on President Diaz of Mexico and President Morales of Brazil, the latter assault resulting in the death of the Minister of War.

The assassination of the Empress of Austria (see **ELIZABETH EMPRESS OF AUSTRIA**) in September, 1898, again drew the attention of the public to the anarchists; and an international conference was assembled at Rome to consider the adoption of more effective measures against them.

The four points to be discussed by the powers, with the understanding that each power was free to propose others were: In the first place, Should Anarchists be considered as common law instead of political offenders? Secondly, Should the offenders be subject to extradition instead of being considered as at present, political refugees? Thirdly, The establishment of ways and means for suppressing anarchistic propagandism in the press; Fourthly, The establishment of an international system of European powers against the anarchists. The conference closed on December 21, 1898, but without publishing its results.

ANCIENT ACCEPTED SCOTTISH RITE MASONS are the Supreme Council of Sovereign Grand Inspectors-General of the Thirty-third and last degree. This is divided into two bodies: Northern Masonic Jurisdiction, with Henry L. Palmer, M. P., Sovereign Grand Commander, and Clinton F. Paige, Binghamton, N. Y., as Grand Secretary-General; and Southern Masonic Jurisdiction, with Thomas H. Caswell, M. P., Sovereign Grand Commander, and Frederick Webber, 433 Third street, Washington, D. C., as Secretary-General. These two bodies hold relations with the Supreme Councils in all countries of the world.

ANGLICAN CHURCH. See **ENGLAND, CHURCH OF**.

ANGLO-AMERICAN ALLIANCE. In England a society known as the Anglo-American League, was founded in 1898 at Stafford House, the Duke of Sutherland presiding. The objects are to secure the "most cordial and constant co-operation" between England and America. Membership is open to British subjects and American citizens. When the Spanish-American war broke out, and there was some indication of a continental coalition to coerce America, a sympathy sprung up between the two great branches of the English race, and there was a mutual popular feeling that the common language, common blood, and essential republicanism in both nations pointed to an alliance of these foremost peoples of the earth. It was evident that the old animosities had for the most part disappeared and that a sympathetic alliance already existed, but a formal or political alliance in the near future seemed very improbable, although an English society was organized to bring about this result. It was recognized that permanent unions must be based upon common interests, ideals and aspirations, while the genius or spirit of government must in each case be the same. These requirements being so nearly met by England and America, the argument for alliance, in terms of expected results, were: "The supremacy of the Anglo-Saxon; the spread of constitutional government, based on an ever-broadening suffrage; the checking of the threatening aggressions of absolutism; the fostering of free speech and free thought through the world; the placing of the United States second to no commercial power; and, lastly, the securing of an ally which would prevent any continental power from meddling with American affairs." While it was recognized by all that a sympathetic alliance might be strengthened with profit to both nations and to humanity in general, one of the objections urged against a political, institutional, or governmental alliance was as follows: England is the chief factor in the "Concert of Europe" by which the *status quo* is maintained. To disturb the "Concert" even slightly would throw all Europe into political confusion and probably into war. England's interests would not permit her to leave the Concert, thus destroying the *status quo*, for the sake of American alliance. Political alliance for us, then, it was claimed, meant our entering into the *status quo* programme of monarchical Europe. And this, it was held, is not the business of a democracy. See the article **UNITED STATES** (paragraphs on History).

ANGLO-AMERICAN COMMISSION. See **CANADA** (paragraphs on History).

ANGOLA, or **PORTUGUESE WEST AFRICA**, lies on the western coast of Africa between the Congo Free State on the north and German Southwest Africa and British South Africa on the south, with a coast line of 1000 miles, an area of 484,800 square miles, and a population estimated at 4,119,000, though some authorities place it at less than half that number. Its capital is St. Paul d'Loanda and some of the important towns are Cabinda, Ambriz, Benguella, Novo Redondo, Mossamedes, and Port Alexander. The chief exports are rubber and coffee, and the chief products besides these include wax, sugar, cocoanuts, vegetable oils, ivory, oxen and fish. Among the minerals copper, malachite, iron, petroleum, and salt are found in great

quantities and gold is said to exist. There are over 200 miles of railway open for traffic and over 260 miles of telegraph line.

ANNUNZIO, GABRIELLE D'. See ITALIAN LITERATURE (paragraph Fiction).

ANTARCTIC EXPLORATION. In the spring of 1898 the Royal Society of England held a conference for the consideration of Antarctic exploration. It was soon rumored that the government was favorably disposed to such an enterprise and that it had approached, with a view to co-operative effect, not only the Australian colonies, but Russia, Germany, and Norway. No such combination, however, resulted, and about the middle of August an English expedition sailed from the Thames in the *Southern Cross*. This vessel, designed by Mr. Colin Archer, the builder of Nansen's *Fram*, has a displacement of 481 tons, is 146.5 feet long, and can maintain a speed of 9 knots; the bows, built of solid oak, are 11 feet thick, and the sides 3 feet thick in the weakest part; the whole is covered with American greenheart, and the ship, with the exception of the *Fram*, was said to be the strongest wooden vessel afloat. The expedition consisting of thirty-four persons and led by Mr. Carsten Egeberg Borchgrevink, an Anglo-Norwegian, included the following scientific staff: Sub-Lieutenant W. Colbeck, R. N. R.; Mr. Louis Bernacchi, of Melbourne Observatory; Mr. Herlof Klövstad, of Christiania University; Mr. Nicolai Hansen; Mr. Hugh Evans. The party was fully equipped for polar travel, the outfit containing a large supply of scientific instruments, small boats of the collapsible pattern, kayaks made in England, but in the Eskimo style, and seventy Samoyad dogs by which sledge-transportation was to be effected over the ice. The object of the expedition was scientific observation rather than the attainment of some farthest-south point or of the Pole. It was hoped in some degree to solve the problem of the "influence of this region on the climatology and meteorology of the world"; it was hoped that botanical and zoological study might reveal some of the former conditions of the region, and that important data might be attained in the field of geology and terrestrial magnetism. Borchgrevink sailed south from Hobart, Tasmania, December 19, 1898.

In the summer a Belgian expedition also sailed. It was commanded by Gerlach and sailed for Grahamland.

ANTHRAX. See SERUM THERAPY.

ANTHROPOLOGY IN AMERICA. Anthropology, the youngest of the sciences, can hardly be regarded as fully organized, despite the widespread interest in the subject and the increasingly voluminous contributions in all civilized countries. Its state of development is such that the more important contributions are those tending to define the science and establish its foundation. Recent contributions of this kind have been made in America, chiefly by three institutions, (1) the Bureau of American Ethnology, (2) the Anthropological Society of Washington, and (3) the American Association for the Advancement of Science. In the current classification of the science, recognized in the official ethnologic bureau, adopted as a basis for the sectional divisions in the second organization, and approved by different members of the third, seven major divisions are recognized, (1) Somatology or the Science of the Somatikos, (2) Psychology, (3) Estheology, (4) Technology, (5) Sociology, (6) Philology, (7) Sophiology or the Science of Philosophies. The five branches last named are sometimes combined for convenience under the term Demonomy—i. e., the science of system of the Demos, the artificial group of men. For special purposes, Somatology is somewhat extended to overlap portions of the fields of the other anthropological sciences so as to form Ethnology—i. e., the Science of the Ethnos, or natural group of men. The several primary divisions are sometimes sub-divided, perhaps the most important subdivision being that of technology into modern and archaic, when the latter is termed archæology. This classification is deemed important as a contribution to anthropology made within the last decade of the century, and also as a basis for the present article.

The Smithsonian Institution and National Museum.—We pass over the first years of American anthropology with a mere mention of such pioneer workers as Eliot and the Jesuits in the seventeenth century, Zeisberger, Heckewelder and Jefferson toward the close of the eighteenth, and Duponceau, Gallatin, Schoolcraft, Hale and Morgan in the first half of the present. The establishment of the study upon a secure basis in this country dates from the founding of the Smithsonian Institution at Washington in 1846, under a bequest of over half a million dollars, left in trust to the United States in 1826, by James Smithson, son of the English duke of Northumberland, "for the increase and diffusion of knowledge among men." Under the management of its first secretary, Joseph Henry, through a long administration of more than thirty years, the Institution grew and developed its usefulness until it became recognized as the leading scientific establishment of America, and perhaps of the world. It is now the central controlling force of several important scientific branches of the government service, including the Smithsonian proper, the Nationa'

Museum, the Fish Commission, the Astrophysical Laboratory, the National Zoölogical Park and the Bureau of American Ethnology. It is governed by a board of regents, including *ex-officio* the President, Vice President and members of the cabinet. Its chief office is styled the Secretary, the present incumbent, S. P. Langley, the third in line of succession, having entered upon his duties in 1888. The Institution is organized upon a broad basis and includes within its scope every department of science, but we shall treat here only of those relating directly to anthropology. Its great storehouse of study material is the National Museum, which had its original nucleus in the collections of the Wilkes exploring expedition of 1838-1842, and was first recognized by Congressional appropriation in 1858. It constitutes now the largest scientific depository in America and probably the third largest in the world. It is organized in three departments, of which anthropology—using the word in its widest sense—is the most extensive and important. The Museum has far outgrown the capacity of the present building, completed in 1881, and there is urgent need of a more commodious structure for the better housing and displaying of collections. The general collections of American archæology are displayed in the building of the Smithsonian proper. The Smithsonian library, most of which is at present accommodated in the Congressional library building, consists of more than 80,000 bound volumes, with pamphlets, periodicals, maps and so forth, aggregating altogether about 360,000 pieces.

The Bureau of American Ethnology.—From the beginning the Smithsonian Institution had given attention to anthropology, its first scientific publication, issued in 1848, having been an elaborate work upon the ancient remains of the Mississippi valley. Others of like character followed from time to time, and in 1876, by co-operation with the United States Geological Survey, of the Rocky Mountain Region, a series was begun under the title of *Contributions to North American Ethnology*, to embody the ethnologic results of the surveying and exploring expeditions then in progress west of the Mississippi. In 1879 the Bureau of Ethnology was established by Congress, as a branch of the Smithsonian Institution, for the special purpose of ethnologic research among the Indian tribes, particularly those of the United States. Major J. W. Powell, director of the geological survey, who had been chiefly instrumental in calling attention to the subject, was made director of the bureau, a position which he still retains, ably seconded by W. J. McGee, as ethnologist in charge. The bureau maintains a force of trained experts and gives assistance also to outside collaborators, in addition to affording them facilities for publication. The work consists chiefly of field investigations among the various tribes, supplemented by library research, the results being published in annual reports and in monograph bulletins issued at irregular intervals. More recently it has been found advisable also to undertake the publication of rare manuscript documents, especially those relating to the Spanish colonization in the southwest. Photographic work is done in the field and in the office, and the Indian portrait and landscape negative number now nearly 7,000. The field collections illustrating Indian art and life are deposited in the National Museum, where they constitute perhaps half of the aboriginal material. The Bureau has its own working library, including a number of rare volumes, and an invaluable linguistic library, consisting of about 1,600 manuscript vocabularies, glossaries and texts, largely gathered by its own workers and recorded in a special phonetic alphabet, making altogether the most important collection of American linguistics in existence. To secure the best results with the greatest economy of labor it was found necessary to map out the working field according to some systematic plan. While for museum or historical purposes the territorial or geographic arrangement may be preferable, for general ethnologic purposes it was found best to base operations upon a linguistic classification, which frequently also corresponds closely with the geographic scheme. In this way the investigator familiar with any one tribe can extend his researches with most advantage to cognate tribes wherever found. It was discovered that the hundreds of native languages in the United States and northward can be grouped into 57 stocks, some of which may hereafter prove to be related. The number of stocks or languages south of the Rio Grande is not yet determined. The ultimate purpose of the Bureau to include in the scope of its operations the whole American continent is emphasized by its recent change of title to the *Bureau of American Ethnology*.

Smithsonian Publications.—Following are the principal former and current publications of the Smithsonian, nearly all of which contain more or less of anthropologic material: *Annual Reports of the Smithsonian Institution*, *Smithsonian Contributions to Knowledge*, *Smithsonian Miscellaneous Collections*, *Annual Reports of the National Museum*, *Bulletins of the National Museum*, besides other special issues. The Bureau of American Ethnology has published in addition sixteen *Annual Reports*, ten *Contributions to North American Ethnology* and a series of bulletins, with other irregular issues. The complete list of Smithsonian publications numbers

several hundred volumes, which, as has been well said, "form in themselves a library which records the progress and illustrates the advance of knowledge in every field of human activity during the last fifty years."

American Museum of Natural History.—Second among the museum establishments of the United States is the American Museum of Natural History in New York City, founded in 1869, and maintained under a joint arrangement by which the building and current expenses are paid by the city while funds for collections and expeditions are supplied by the liberality of generous patrons, foremost among whom is the president, Morris K. Jesup, who has given special encouragement to expeditionary work. The present building was formally opened in 1877, and will be, when completed, the finest museum building in the country. The department of anthropology was regularly organized in 1894, with F. W. Putnam as curator, who still holds the position, dividing his time between this and the Peabody establishment at Cambridge. Besides its annual reports the museum publishes at irregular intervals a series of bulletins and memoirs, and maintains a course of lectures, with special reference to the needs of the teachers of the city and State. The library numbers now about 35,000 volumes. In the department of anthropology every man is an experienced field worker of established reputation, the result being apparent in the character and arrangement of the case material. Special attention is given to somatology, and ethnic traits are made distinct by means of life-size groups dressed, posed and equipped with careful fidelity of detail, all the figures being built up from actual photographs, casts and measurements. Three important explorations are now being carried on under the direction of the museum, viz: The Jesup North Pacific Expedition, along the coast region of British Columbia, Alaska and Siberia; the Bandelier explorations among the ancient remains of Peru and Bolivia, and the Lumholtz researches in the Sierra Madre region of Mexico. The first named is an extension of the work begun by Boas, and is expected to have important bearing upon the problem of Asiatic influence in American civilizations. The Bandelier explorations were inaugurated and carried on for some time by the liberality of Henry Villard, who donated the collections obtained to the museum, which now continues the work. Among the most important of the American collections may be noted: The Emmons collection from southern Alaska; the Peary collection from north Greenland; the Smith, Teit and Powell-Bishop collections from British Columbia; the Chenoweth and James collections from Manhattan Island; the Volk collections from the Trenton gravels; the Jones collection of southern antiquities; the Hyde and Mearns collections from the Pueblo ruins of the southwest; the Terry collection from California; the Lumholtz, Jesup and Saville collections from northwestern and Central Mexico; and the Garces and Bandelier collections from Peru and Bolivia; besides the noted Charnay casts of sculptures from the ruined cities of Yucatan and Central America, the gift of the duke of Loubat.

The Peabody Museum.—The Peabody Museum of American Archæology and Ethnology, established in connection with Harvard University of Cambridge, Massachusetts, was founded in 1866 under a bequest of the noted philanthropist, George Peabody. The present building was begun in 1876. The curator since 1874 has been F. W. Putnam, who also fills a university chair as "Peabody Professor of American Archæology and Ethnology," in addition to being curator of anthropology in the American Museum of Natural History. Under his direction there is a regular course in anthropology, consisting of lectures and special work, and supplemented by several endowments for the encouragement of anthropologic research, chief among which is the Thaw fellowship, now held by Miss Alice C. Fletcher, well known for her Omaha studies. There is a small museum library containing about 2,000 volumes, in connection with the university library proper. From time to time the museum publishes various ethnologic papers, in addition to its annual reports. Among the many valuable collections probably the largest and most important is that from the Hopi Indians of Arizona, obtained by Dr. J. Walter Fewkes while in charge of the several expeditions fitted out by the generosity of Mrs. Mary Hemenway. The material collected by Miss Fletcher includes some of the most sacred paraphernalia of the Omahas, in addition to costumes, utensils and native foods. Archæology is well represented from every section of the United States. There are valuable collections from the Santa Barbara Islands of California and the Salado ruins of Arizona, while the celebrated Calaveras skull and the Abbott collections from the Trenton gravels of the Delaware Valley have especial interest in connection with the question of the antiquity of man in America. There is also a fine somatologic collection of several thousand skulls and skeletons. Among the collections from the Latin American States the most notable are those from the ruined city of Copan in Honduras, and the Blake collection obtained from the graves of Arica in 1836, the first Peruvian collection ever brought to this country.

AMERICAN MUSEUM OF NATURAL HISTORY, NEW YORK, AS IT WILL APPEAR WHEN COMPLETED.

The Essex Institute.—This establishment deserves notice as a pioneer fosterer of anthropologic interest in America. Originating in collections brought from the South Sea Islands by returning ship captains, in which department it is perhaps unsurpassed in this country, its work is now devoted chiefly to the biology and archæology of Essex county, being in this respect a model of museum specialization.

University of Pennsylvania.—The University of Pennsylvania, at Philadelphia, maintains a chair of American Archæology and Languages, established in 1886, with Dr. D. G. Brinton as its incumbent. In 1889 the Museum of Archæology was organized, from which grew later (1891) the Department of Archæology and Paleontology. In addition to notable researches in the old world, successful explorations have been conducted in the Delaware valley, Pennsylvania, and in Florida and Bolivia. Of especial interest are collections of games and musical instruments, and of Pueblo and Peruvian antiquities. The museum sustains a course of lectures and publishes a quarterly bulletin.

Carnegie Museum.—This museum is a department of the Carnegie Institute of Pittsburgh, Pennsylvania, founded by the magnificent liberality of Andrew Carnegie and formally opened in 1895. It is under the supervision of Dr. W. J. Holland, Director, and although as yet in its infancy, bids fair soon to occupy a leading place among museum establishments. The collections include valuable material from Alaska, the southwest and South America. Plans are under way for systematic exploration, and a beginning has been made among the mounds of the upper Ohio.

University of Michigan.—This university, founded in 1837 and endowed as a State institution, has for several years past been giving attention to anthropology and conducts a regular course in American archæology. The museum possesses quite a valuable archæologic collection, and the beginning has been made, in coöperation with the Archæological Institute of America, of a systematic exploration of the ancient remains in which the State is particularly rich.

Field Columbian Museum.—The Field Columbian Museum of Chicago, Illinois, incorporated in 1893, had its origin in collections brought together for the World's Fair, the building being provided by the liberality of Marshall Field and other public-spirited citizens. It is well equipped in every department, with F. J. V. Skiff as director and George A. Dorsey as curator of the Department of Anthropology. It maintains a lecture course and includes among its publications a series of anthropologic papers. Expeditionary work is conducted in various parts of the world, chief among the American explorations having been those in Yucatan and southern Mexico, Alaska and the adjacent Siberian coast, and among the tribes of the western Canadian frontier. An important part of its working equipment is a fine physical and psychical laboratory. The museum has collections from every part of the old world, notably from Egypt, South Africa, Siberia, Assyria and Oceanica. Among North American collections the most important are the Bruce and other Eskimo collections; the Jacobson and Deans collections from the northwest coast; the Dorsey Blackfoot collection; the Ayer collection from the tribes of the plains and western United States; and the Moorhead collection of copper objects from the Ohio mounds. Mexico and Central America are well represented in casts, photographs and archæologic remains from the ruined cities. Of special note from South America are the remarkable Dorsey collection from the ancient graves of Ancon, Peru, and the splendid Hassler collection from the wild tribes of the Gran Chaco. In close touch with the museum is the University of Chicago, which conducts a course in anthropology, and has also some valuable collections of its own.

Trans-Mississippi Establishments.—Among the more western establishments which give attention to anthropology the most important is the Davenport Academy of Natural Sciences, organized at Davenport, Iowa, in 1867. It has issued several volumes of Proceedings, has a library of over 30,000 volumes, and a museum especially rich in archæologic material of the upper Mississippi region. The State Historical and Natural History Society of Colorado, with headquarters in the State house at Denver, was organized in 1879. Its collection of mummies and other ancient remains from the cliff ruins of the Mancos and Chaco cañons, the largest and most complete in possession of any institution, is in charge of W. C. Ferril, curator. On a suggestion of the society the patriotic women of the State have inaugurated a movement for the preservation of the more important ruins as a State reservation. In California there are valuable collections with the Golden Gate Park Museum in San Francisco, and the Historical Society of Southern California, in Los Angeles. Various other western State and territorial organizations have also begun work which promises well for the future. In distant Hawaii, now a part of American territory, the Bernice Pauahi Bishop Museum, founded at Honolulu in 1889 and now in charge of W. T. Brigham, director, is doing valuable work in the preservation and elucidation of Polynesian ethnology.

Canada and Latin America.—Of institutions outside the boundaries of the United States it is only possible to mention the names. In Canada the most important are McGill University, Montreal, which contains the Dawson ethnologic and archæologic collection; the Ontario Archæological Museum in Toronto; the Nova Scotia Institute of Science at Halifax; and the Provincial Museum at Victoria, B. C. In Latin America the principal are the Museo Nacional, in Mexico City, Mexico; Instituto-Físico-Geográfico Nacional, San José, Costa Rica; Museo Nacional, of Rio Janeiro, Brazil; Museo Nacional, Caracas, Venezuela, with Dr. Adolf Ernst, director; Museo Nacional, Santiago, Chile; and the Museo de La Plata, Argentina, in charge of Don Francisco Moreno.

Societies and Journals.—Among societies particularly devoted to anthropology and kindred subjects may be named the Anthropological Society of Washington, which publishes a journal called the *American Anthropologist*; the American Association for the Advancement of Science, which has a Section (H) devoted to anthropology; the American Folklore Society, publishing the *Journal of American Folklore*; the American Philosophical Society, of Philadelphia; the Archæological Institute of America; the American Antiquarian Society; the National Geographic Society, of Washington, publishing the *National Geographic Magazine*; and the various historical societies, together with the Canadian Association for the Advancement of Science, which is doing good work in its own territory. Of non-society journals devoted to the subject the principal is the *American Antiquarian*, published at Good Hope, Illinois.

The Year's Progress.—The most substantial evidence of the growth of popular interest in anthropology was the recent appropriation by Congress for an exhibit of native tribes at the Trans-Mississippi Exposition (see INDIAN CONGRESS AT OMAHA). Recent events have served to direct attention to Hawaii and the West Indies, as well as to the Philippines, and measures are already being taken for researches in those regions, under society or governmental auspices. The Christmas gathering of the A. A. A. S. and the American Folklore Society at Columbia University in New York were of special interest by reason of the number and importance of the papers presented. The second quinquennial award of the Loubat prizes for the best monographs, published in English within the three years preceding, upon subjects relating to North American archæology, ethnology or philology, was made at Columbia University on May 21, the first prize, of \$1,000, being given to W. H. Holmes for his work on *Stone Implements of the Potomac-Chesapeake Tidewater Provinces*, and the second, of \$400, going to Dr. Franz Boas for his monograph on *The Social Organization and Secret Societies of the Kwakiutl Indians*.

ANTIGUA. See LEEWARD ISLANDS.

ANTIMONY. The production of antimony metal in 1898, was 1,100 short tons as against 750 short tons in 1897. The two producers were the Mathieson Smelting Co., N. Y., and the Chapman Smelting Co., of San Francisco. Most of the metal was derived from imported ores, although some was mined in California, Nevada, and Utah. The old mines at Rowdon, Nova Scotia, were reopened, and new deposits are reported from France, which are said to be lead-silver bearing.

ANTIQUARIAN SOCIETY, AMERICAN, membership limited to 140. President, Stephen Salisbury; Secretary, Charles A. Chase.

ANTISEPTICS. See FORMALDEHYDE.

ANTWERP, INTERNATIONAL CONGRESS AT. See BELGIUM.

ANTWERP, NATIONS OF. See LABOR (paragraph Nations of Antwerp).

APPALACHIAN MOUNTAIN CLUB, an association of persons interested in the mountains of New England and adjacent regions, was organized in 1876 and in 1878 was re-organized and chartered as a corporation by the Commonwealth of Massachusetts. In 1898 the club had published, besides its regular periodicals *Appalachia* and *Reports*, twelve books and sets of maps of mountain regions. There is a library of over 1,000 volumes. Membership in 1898 was about 1,100. President, William H. Niles.

AQUEDUCTS. See CANALS (paragraph Aqueducts).

ARABIA is a large peninsula in the southwestern part of Asia with an estimated area of 1,230,000 square miles, although some estimates place it at about 1,000,000. There is equal uncertainty in regard to the population, which is variously estimated at from 4,000,000 to 12,000,000, the lower estimates being the more recent. It contains two provinces, Hedjaz and Yemen, which are under Turkish rule, and a wide tract of territory part of which is under British influence. The British influence, for instance, is exercised over Oman, an independent state in the southeastern part of the peninsula and extending for nearly 1,000 miles along the coast. Friendly rela-

tions have existed for years between the government of India and Oman, and Muscat is the seat of a British consul or political agent. Aden, a town and peninsula on the Arabian coast lying about one hundred miles east of Babelmandeb, is a British dependency and subject to the Bombay government. It is an important coaling station on the route to the east and comprises four towns, namely, Aden, Little Aden, Steamer Point, and Shaik Othman. Its trade is considerable and its population in 1891 was about 42,000. The Turkish provinces of Hedjaz and Yemen have together an estimated population of 1,050,000, and their combined area is 173,700 square miles.

ARBITRATION, INTERNATIONAL. Notwithstanding the Spanish-American War and various colonial hostilities throughout the world, the year 1898 was one of progress for the principle of international arbitration. More than ever before men of affairs began to think that this principle might be able in most cases to usurp war; and great hopes were expressed that arbitration would settle difficulties in their incipency and that thus the more severe strains between nations would be avoided. It is said that the movement has been prosecuted in various ways in almost all parts of the world; it chiefly expresses itself through the peace and arbitration societies. There is scarcely a place of any great importance in Germany, Switzerland, or Italy that has not one of these societies. In France the movement has been augmented largely through the French Society for Arbitration between Nations (*La Société Française pour l'Arbitrage entre Nations*) and a Woman's International League for Disarmament. In England the work has been carried on by various peace societies; the International Arbitration and Peace Association deserves special mention. Public sentiment in America, notwithstanding the fact of the war with Spain and the failure of the Senate in 1897 to ratify the British arbitration treaty, is strongly in favor of the peace movement. President McKinley has said, "the citizens of the United States have the right to be proud that their country is in the van in the efforts which are being made for international arbitration."

In June, 1898, a convention for the consideration of international arbitration, consisting chiefly of prominent lawyers, clergymen, and teachers, was held at Lake Mohonk. The following is quoted from the conclusions of this convention:

"In the following cases, several of which have been for the first time submitted during the year, controversies between nations have been under consideration by tribunals of international arbitration, viz.:

- (1) Great Britain and the United States, in the case of the Behring Sea damages claims.
- (2) Great Britain and Venezuela over the celebrated question of boundary.
- (3) Great Britain and France, over various questions of boundary in Western Africa.
- (4) Great Britain and Portugal, over the Delagoa railway dispute.
- (5) Great Britain and Portugal, over the Manica frontier.
- (6) Great Britain and Belgium, over the expulsion of an English citizen, Mr. Ben. Tillet, from Antwerp.
- (7) Great Britain and the United States of Colombia, over the matter of a railway built by British citizens in the territory of the latter.
- (8) Great Britain and the United States, over the Alaska boundary.
- (9) Great Britain and Germany, over the claims of the Denhardt Brothers in southeast Africa.
- (10) France and Brazil, over the French Guiana-Brazil boundary dispute.
- (11) France and Germany, over a question of boundary in the Hinterland of Togo, in West Africa.
- (12) Chili and Peru, over a boundary dispute.
- (13) Hayti and San Domingo, over a question of boundary.
- (14) The United States and Canada have just agreed to submit to a commission all questions in difference between them."

In the progress of the arbitration movement, one great difficulty has been recognized, viz., the attachment of a proper and trustworthy arbiter. Successful arbitration postulates an arbitrating authority that is "judicial in spirit as well as position and . . . entirely beyond suspicion either of fear, partiality, or corruption." Moreover, the arbitrating authority, it is said, should be permanent. As arbiter some great monarch has been suggested. Great monarchs, however, not only have little time for added judicial duties, but the untrustworthy knowledge and character of many of their advisers would render their decisions unsatisfactory. Some minor king, moreover, whose interests are not far-reaching, however capable he may be, is not in the eyes of the world an impressive person; and besides this his subjects would fear the resentment of some great nation against which the king might render a decision. The president of the Swiss republic has been suggested, the foreign interests of this country being so limited. A man like the recent chief magistrate, M. Numa Droz is probably able and worthy, but it cannot be expected that the Swiss can always choose a president who is a suitable international judge. The device of

Mr. Olney and Lord Salisbury in the Venezuela trouble, namely, two arbiters from the Supreme Court of each country, they having power to choose a fifth man, was generally regarded as fair; but such an arbitration commission would be manifestly unsatisfactory, not to say unfair, if one of the less dignified nations—a Spanish-American republic, for instance—should be involved. As international arbiter the Pope has finally been suggested, "who would presumably do justice, and who could not even be suspected of corruption." But it is clear that not even a man of the ability of Leo XIII could be entirely free, or at least thought to be entirely free, from creed prejudice; and moreover laymen have a suspicion, unwarrantable though it often is, of the clergy's ability in statecraft.

ARBITRATION, LABOR. A resort to arbitration in disputes between laborers and employers has often proved successful when undertaken in good faith. The value of this means of maintaining industrial peace is recognized in many States of the United States, whose legislatures have by law established boards of conciliation or arbitration, which are authorized to investigate the matters in dispute and to offer their services toward securing an adjustment. By some, compulsory arbitration of labor disputes has been proposed. This would make the decision of the board of arbitration legally binding. The objections to it are, first: the difficulty of forcing the laborer to abide by the decision, and, in the second place: the possible discouragement to the investment of capital under such conditions. In general it has been viewed as too serious a limitation of the freedom of labor contracts to be safely employed. An important law of the United States relating to the arbitration of labor disputes between common carriers engaged in interstate commerce and their employees was passed in 1898. This provided that in the event of a controversy between such common carriers and their employees the matter should be submitted, upon the request of either party to the controversy, to the Chairman of the Interstate Commerce Commission and the Commissioner of Labor. If these arbitrators are unable to secure a settlement, a controversy may be submitted to the arbitration of a board of three persons, one to be named by the employer, the other by the labor organization to which the employees belong, and the third to be chosen by these two. As to the binding nature of the award, it was provided (1) that it should be "final and conclusive upon both parties unless set aside for error of law apparent on the record." (2) That the respective parties to the award should each faithfully execute it. (3) That employees dissatisfied with the award should not by reason of such dissatisfaction quit the service of the employer before the expiration of three months from the making of the award, without giving thirty days' notice, and that the employer should not dismiss any employee within the three months without giving a similar notice. (4) That the award should remain in force for one year. A recent report published by the French Board of Labor concerning the extent to which arbitration was resorted to during the year 1897, shows that less than 25 per cent. of the strikes were submitted to arbitration.

ARCH. SEE BRIDGES (paragraph Arch).

ARCHÆOLOGICAL INSTITUTE OF AMERICA. The report of the President, Professor J. W. White of Harvard University, shows that the recent changes in the constitution have been of advantage in the closer connection of the affiliated schools at Athens and Rome, and in the greater stability of the Council whose power to transact business has been in no way hindered by the increase from 20 to 41 members. The annual meeting was held at Columbia University, New York, on May 14, 1898, and was well attended. A new branch has been organized at New Haven with 58 members and President Dwight of Yale University as its first president. The *American Journal of Archæology* has entered upon a new series, as the official *Journal* of the institute, and in spite of many difficulties has already almost made up the delay in beginning publication. The award of the Fellowships in the schools at Athens and Rome as a result of competitive examinations has already resulted in a distinct improvement in the qualifications of the students and a corresponding gain in the character of their work. The success of the schools has led to a movement to found a similar school for Oriental study in Palestine, and the institute has voted to receive such a school into the same relation as the other schools on its opening, which is expected to occur in the autumn of 1899. The chief work of the year has been the support of the excavations at Corinth (see ARCHÆOLOGY, paragraph Greece), while the interest of the local societies has been stimulated by lectures on archæological subjects. Very gratifying has been the increase of 219 in the membership, so that the institute now numbers 128 life and 705 annual members, with every prospect that the total will soon reach 1,000, a number needful to insure the proper progress of the work already undertaken. The reports of the affiliated schools show that at Athens 11 students were in attendance, a number only once exceeded in the past, while in maturity and attainments these members are decidedly superior. At Rome the value of the school has already been clearly shown, but the temporary character

of its financial arrangements has led to special efforts to secure a more permanent endowment from the alumni of the colleges most interested. The need of more complete preparation on the part of the students and of greater permanence in the resident staff has been emphasized by all the annual Directors.

ARCHÆOLOGY I. *Babylonia*.—In the exploration of the ruins of the ancient Assyrian and Babylonian empires the past year has not been marked by the publication of important results such as followed the excavations at Nippur. The year has been rather one of organization from which valuable discoveries may be expected in the near future. Near the beginning of the year a German oriental society (*Die deutsche Orient-Gesellschaft*) was organized for the exploration of the Tigris-Euphrates valley, Western Asia and Egypt, and an expedition was sent to Babylonia to determine upon a profitable site for excavations. The University of Pennsylvania has also sent out an expedition to continue the excavations at Nippur which have already yielded so much of value.

A new document relating to the Babylonian story of the deluge has been published by Father Scheil. It is merely a small fragment of a clay tablet, originally containing four columns of cuneiform writing on each side. What is preserved contains a part of the first, second, seventh and eighth columns in a much mutilated condition, but fortunately including the superscription of the scribe, from which it appears that the tablet was written in the reign of Ammizaduga, about 2100 B. C. In spite of the unsatisfactory nature of the text, it is clear that it deals with the subject of the deluge, already known from the version published by George Smith. The new tablet, however, is much earlier than the old version, and seems to have presented the version current at Sippara, where it was found. The name of Adram-khasis, applied to the survivor of the deluge in the old version, occurs in the new fragment, and it is probable that the god Ea, to whom the Babylonian Noah owed his safety, was introduced as remonstrating with the god Bel, who had planned to destroy mankind. Old as the tablet is, it is but a copy of a still older document. The information yielded by the cuneiform inscriptions does not relate merely to remote antiquity. In the annals of King Nabonidus for the year 547 B. C., we find a record of an expedition of Cyrus, which can scarcely be other than the one against Croesus, and from a study of Babylonian tablets, M. Jules Oppert has recently reached the conclusion that the death of Alexander the Great occurred in the temple of Bel-Merodach on Friday, May 11th, 323 B. C. Incidentally the same writer has endeavored to fix the dates of the Greek cycles of Meton and Callippus, placing the commencement of the former on July 28th, 433 B. C., and that of the latter on June 29th, 330 B. C. These calculations show that Alexander was born on Tuesday, July 23d, 356 B. C.

II. *Persia*.—In this country the French have obtained a monopoly of archæological exploration, and their excavations at Susa, where M. Dieulafoy made valuable discoveries, have been in charge of M. J. de Morgan, already well-known for his work in Egypt. No complete account of his work has appeared, but from his preliminary reports to the Ministry of Instruction, it seems that he has already secured important results. So far his campaign has been directed chiefly against the mound called the "citadel." The upper layers here yielded Persian and Arab pottery extending back to the Middle Ages; then were disclosed walls and pottery belonging to the period from 330 B. C. to 226 A. D. Of the Achaemenid period which should have appeared next, and to which Dieulafoy's discoveries belonged, few traces were found. The important discoveries were made about five feet lower, where remains of the very early period of the Anzanite kings were found. Here were found walls, probably of a palace, many glazed bricks, some 800 inscribed bricks, and also sculptures, both in the round and in relief, some of which bore long inscriptions, which in some instances are in archaic characters presenting great difficulties of decipherment.

III. *Egypt*.—Of recent years Egypt has been the country where excavation has been most persistently and profitably carried on. Indeed the attractions of this field have been so great that the government has at last appointed a committee on archæology, composed of foreign scholars in its service, which is to have control over concessions for excavating, and by its oversight prevent the destruction of valuable monuments and the many abuses sure to follow where such important work as the uncovering of ancient remains is left to untrained and often unprincipled excavators, who not only destroy recklessly but make no proper records of their discoveries.

At Thebes, in the valley of the Tombs of the Kings, M. Loret, the director of the department of antiquities, has discovered two more royal sepulchres. The first was that of Thothmes III, whose mummy was found some years ago at Dier-el-Bahari,—the other was that of Amenophis II. In this tomb not only was the body of the king still in its sarcophagus, but in a side chamber were found eight more royal mummies, which have been partially identified as those of Thothmes IV, Amenophis III, Sety II, Setnecht, and Ramses IV, VI, and VIII. The eighth mummy has been variously identified as that of Akhenaten and of Merenptah. Four human bodies, not em-

balmed but merely dried, were found in his tomb and from wounds which all bore in head and breast, the conclusion has been drawn that they were victims of human sacrifice, of which custom there are not a few traces in ancient Egypt.

The Egypt Exploration Fund carried on its excavations at Denderah, where Mr. Petrie hoped to find prehistoric remains. Though this hope proved vain, yet the history of the place was made clear. From the IVth to the XIth dynasty and again during the time of the Ptolemies and of Roman rule the place flourished greatly, but during the intervening period it seems to have been almost deserted, as scarcely any remains were found.

The Egyptian Research Account has been busy at Hierakonpolis (Kom-el-Ahmar), where Mr. Quibell has made most interesting and valuable discoveries, which tend to throw light on the earliest historical period in Egypt. Under a temple of the XIIth dynasty was found a mass of votive offerings of earlier times. Among these objects were a large bronze statue of Pepy I of the VIth dynasty, with a smaller one inside it, and a large hawk, with the body of copper, and the head of gold. The other remains were chiefly of the period of the first three dynasties, and include a fine slab of slate sculptured on both sides with the deeds of the king Narmer, and mace-heads covered with reliefs also dealing with historical subjects, as well as hundreds of figures in ivory and clay, plaques, cups and dishes, and flint weapons.

Early in the year it was announced that Amélineau, who has been digging for three years at Abydos, had found the tomb of Osiris, but more detailed information shows that the discoverer had not been so successful as he had supposed, and that his results, though interesting, are by no means startling. The slate cenotaph, which was the chief object in the tomb has proved to be of late date, and so good an authority as Maspero has expressed the opinion that there is no ground for the belief in the historical character of Osiris, and that the tomb is of the IInd or IIIrd dynasty.

Though no such sensational discovery as the Logia or Bacchylides (q. v.) has been recorded during the past year, still the first volume of the papyri from Oxyrhyncus, edited by Grenfell and Hunt, contains much of interest and value. Among the new literary fragments are some mutilated verses which are quite probably by Sappho, a portion of a work on Greek metre, a part of a chronological work relating to events between 355 and 315 B. C., and some bits of anonymous verse. There are also many fragments of authors already known, including a fairly long passage from Thucydides, which though yielding no new readings of importance, are of value as confirming the authority of our manuscripts. The greater part of the volume is naturally given up to the non-literary papyri, dealing with a great variety of subjects, and including not a few private letters, which afford interesting glimpses of the family life in the time of the Romans. Such are the letters in which a father informs a would-be son-in-law that the engagement is broken off, or in which a boy begs his father to take him to Alexandria, accompanying his request with distinct intimations of bad conduct in case of refusal.

IV. *Asia Minor*.—The rock tombs of Phrygia, already objects of great interest to archæologists, have lately been the subjects of careful investigation by Dr. Körte of Bonn, formerly the archæologist connected with the building of the Anatolian railway. He gives strong arguments for accepting two propositions. First, the so-called "grave of Midas" and other similar façades decorated with geometric patterns are not tombs, since they lack a burial chamber, but are really shrines of Cybele, or the ancient Phrygian god Midas. There are, however, seven rock-hewn tombs of the same general type. All these monuments are decorated in a style which shows the influence of the art of the Ionians of the coast of Asia Minor. This period of Greek influence extended from about 630 B. C., when the Lydians drove back the Cimmerian invaders, to 546 B. C., when the Persians under Cyrus conquered this region. Second, the other graves, which are formed by chambers hewn in the rock, and containing niches for the dead bodies, are at least 600 years later, and belong to the second, third and fourth centuries of our era, when under the rule of Hadrian and his successors Phrygia again enjoyed a period of prosperity, which is reflected in these costly sepulchres.

Preliminary reports on the excavations conducted by the Austrian Institute at Ephesus have appeared during the year. The results are not as yet very clear, though a fine market place some 70 metres square, surrounded by a colonnade, with a number of rooms, has been uncovered, and a number of pieces of sculpture, including a fine bronze statue of a youth, and some inscriptions have been found. The work on other portions of the site is still incomplete, but the theatre has already proved to be in a fair state of preservation, with stage-buildings containing two stories. In view of the importance of the city in Roman times there can be no doubt that the future reports of these explorations will contain much of interest.

From Priene, where the Berlin Museum has been at work, come reports which show that the ground plan of a Hellenistic city has been recovered. Not only have

the public buildings been laid bare, but the private houses have been found, in many cases still showing their decorations, which resemble those in the first period at Pompeii. The city was built on a steep side hill, and was laid out with great regularity, with broad streets running along the face of the hill on the terraces, and crossed at right angles by steep narrow lanes. The houses are all built around courts, connecting with the side streets by single doors. The market place contained the great altar of the city, and was surrounded by colonnades adorned with statues of bronze and marble, and in at least one instance containing important inscriptions. The theatre is very well preserved, with the exception of a considerable portion of the upper part of the seats for the spectators. The orchestra is complete, and contains an altar, not in the centre, where it might have been expected, but at the point farthest from the stage-buildings. These latter are in better preservation than in any other Greek theatre; the proscenium is in part standing, and there are remains also of portions of the second story. The building shows clearly the alterations which were made in Roman times in order to adapt the structure to the changed style in dramatic performances.

V. Greece.—Any account of archæological discoveries in Greece naturally begins with the work done by the Greek Archæological Society. The most valuable results of this body have been obtained at Thermon in Ætolia. One of the earliest discoveries was the great hill with a front of 130 metres, where the delegates of the Ætolian League gathered. More important, however, is the excavation of an ancient Doric temple, which must certainly throw much light on the early history of Greek architecture. The upper part was built of crude brick and wood; the columns were originally of wood, but these were later replaced by stone, as was the case in the Heræum at Olympia. The front had five columns, and the interior was divided by a row of columns into two naves. The cornice was decorated by alternate male and female heads, of which the former served as water spouts. There were found also fragments of painted terra-cotta metopes, showing colored figures on a light ground, and in technique bearing a strong resemblance to the painted vases. Although this building must have been erected in the seventh century, there are below it the foundations of two earlier structures, probably its predecessors.

At Eleusis A. N. Skias has discovered a very early necropolis, which had been hitherto undisturbed, and in which it is possible to distinguish six strata of interments. The pottery shows that this place of burial was in use from the Mycenæan period down to the time of the early Corinthian vases.

Thucydides tells us that when the Athenians purified the island of Delos in 426 B. C., they removed the dead to the neighboring island of Rheneia, and forbade future burials in the sacred soil. Recently excavations at Rheneia have brought to light the plot of ground chosen for the reinterment of the dead from Delos. In an enclosure, containing about 500 square metres, is a layer of bones about $\frac{1}{2}$ metre in depth. The bones have been placed in compartments formed by stone slabs set on edge and covered by flat stones. With the bones were found many fragments of pottery, from prehistoric times down to the period of Attic red-figured ware. There were also 30 stone sarcophagi, red-figured vases only, which probably contained bodies but recently interred, and therefore transported untouched.

The French school, the oldest of the foreign centres of archæological study in Greece, celebrated its semi-centennial on April 16-18, 1898. During the festivities two commemorative pillars each containing a bronze medallion, were unveiled and addresses were delivered by the director, M. Homolle, and representatives of the Greek government, the French Academy and the foreign schools.

The excavations at Delphi, which were begun in 1892, are fast nearing completion, and the publication of the results has begun in the *Bulletin de Correspondence Hellénique*, the origin of the French School. These publications make no claim to be a systematic presentation of the subject, and indeed it is as yet too early for any such attempt, but they bring to notice various phases of the work, and with the aid of the plan of the sacred enclosure, a good general idea of what has been accomplished may be obtained.

Among the discoveries at Delphi a prominent place is taken by the large number of votive offerings, some of which were monuments of large size. Such a monument was the bronze statue of a charioteer, which is one of the finest works of art yielded by these excavations. Other fragments show that the original group contained a quadriga, or four-horse chariot, with the driver, and one or two children who led the horses. Whether the owner of the chariot was represented in the act of mounting or was even in the group must remain uncertain. This monument seems to have been the offering of Polyzelus, brother of Gelo and Hiero, who dedicated it between 478 and 472 B. C. Other offerings of individuals or cities have been discussed by Director Homolle: 1. The column of the Naxians, erected about 550 B. C. This column was about 10 metres high and probably surmounted by

a colossal sphinx, thus furnishing a model for the representations of Œdipus and the Sphinx, which appear in various works of art. 2. The four bases which bore the tripods dedicated by Gelo and his three brothers in gratitude for the great victory of Himera, gained by the Sicilian Greeks over the Carthaginians in 479 B. C. 3. A large group of statues set up by Daochus the Thessalian, who was ambassador of Philip of Macedon. The group contained statues of Daochus and his ancestors for about 150 years, and later his son added his own statue and another to the row. 4. In a building near the temple once stood a famous group by Lysippus and Leochares, representing Alexander the Great rescued from a lion by Craterus. No trace of this work of art has been found, but on the rear wall of this little hall have been discovered the verses in which the monument was dedicated. 5. A more puzzling monument is a column in the form of an acanthus stem, surmounted by a group of three dancing girls, in short tunics and with the basket called calathiscus on their heads. This was the costume worn by the Laconian girls in their national dance, the Caryatis, while the character of the column on which they stand naturally suggests the city of Acanthus on the Chalcidian peninsula. The conjecture, therefore, is by no means improbable that the monument was erected by the inhabitants of Acanthus to commemorate their alliance with the Spartans which was the first-fruits of the expedition of Brasidas to the North in 424 B. C. 6. It is also announced that large fragments, sufficient for a satisfactory reconstruction, have been found, belonging to a monument set up by Aemilius Paulus, the conqueror of Perseus, the last King of Macedon, in honor of his victory at Pydna.

Of other works of art the reliefs, which once decorated the theatre, furnish interesting examples of provincial art in the second or first century before Christ. The scenes are chosen from the labors of Heracles, and the choice indicates that the cycle which is well known on Roman sarcophagi had not yet become fixed.

The inscriptions yielded by the excavations are very numerous, and promise to throw much light on the history of the Amphictyonic Council, and the temple of Delphi. Many of the documents relate to the accounts of the temple, and one stone has preserved the record of the earlier payments by the Phocians of the heavy fine imposed upon them at the end of the second Sacred War. An interesting fragment seems to show that the list of victors in the Pythian games compiled by Aristotle and Callisthenes, was so pleasing to the Delphians, that they not only thanked and crowned the authors, but ordered the work itself inscribed on the wall of the sacred building.

The German Archæological Institute at Athens has conducted some excavations on the island of Paros, where Dr. Rubensohn has uncovered a sanctuary of Asclepius, and two other places probably dedicated to Aphrodite and Eilethya, and traced the course of the city walls. Many inscriptions, some of considerable length, were found, and also architectural decorations and terra-cottas, though the most valuable discovery in the field of art was a fine and well-preserved archaic statue of the "Apollo" type. In Athens the investigations of the ancient aqueduct of Peisistratus and of the north slope of the Areopagus were continued, but attention was chiefly directed to the excavations near the ancient Agora, and these were rewarded by the discovery near the "Theseum" of the broad road which once led from the Dipylon gate to the market. These excavations are throwing much light on many vexed points in the puzzling field of Athenian topography, but it must be admitted that as yet the many questions raised have not received final answers, and indeed the ultimate solution seems to depend on information still hidden by modern houses.

The work of the British School at Athens has centred in the excavations on the island of Melos, where the trial diggings during 1896-97 resulted in showing that the island possessed great importance for the prehistoric Ægean civilization. The remains belonged to the pre-Mycenæan time, and included tombs, house-walls and a multitude of small objects, such as terra-cottas, pottery, and implements of stone, obsidian and bronze. Though no detailed account of the work in the last campaign has yet appeared, the statement has been made that one of the sites has already proved almost a second Troy, in the clearness with which are defined the strata of successive settlements. As the ground has been practically untouched, it is possible to distinguish three periods, while the great amount of pottery is certain to contribute to the solution of the vexed questions concerning the early civilizations of the Ægean.

The American School at Athens has continued the excavations on the site of ancient Corinth, which were seriously interrupted in 1897 by the war. Detailed plans and descriptions are not yet published, but the preliminary report of the director, Professor R. B. Richardson, shows clearly that the experimental period of the work has passed, and that a firm basis for the future has been gained, so that it is now only a question of time and money, though of the latter there is as yet unfortunately only a scanty supply. The work this year has

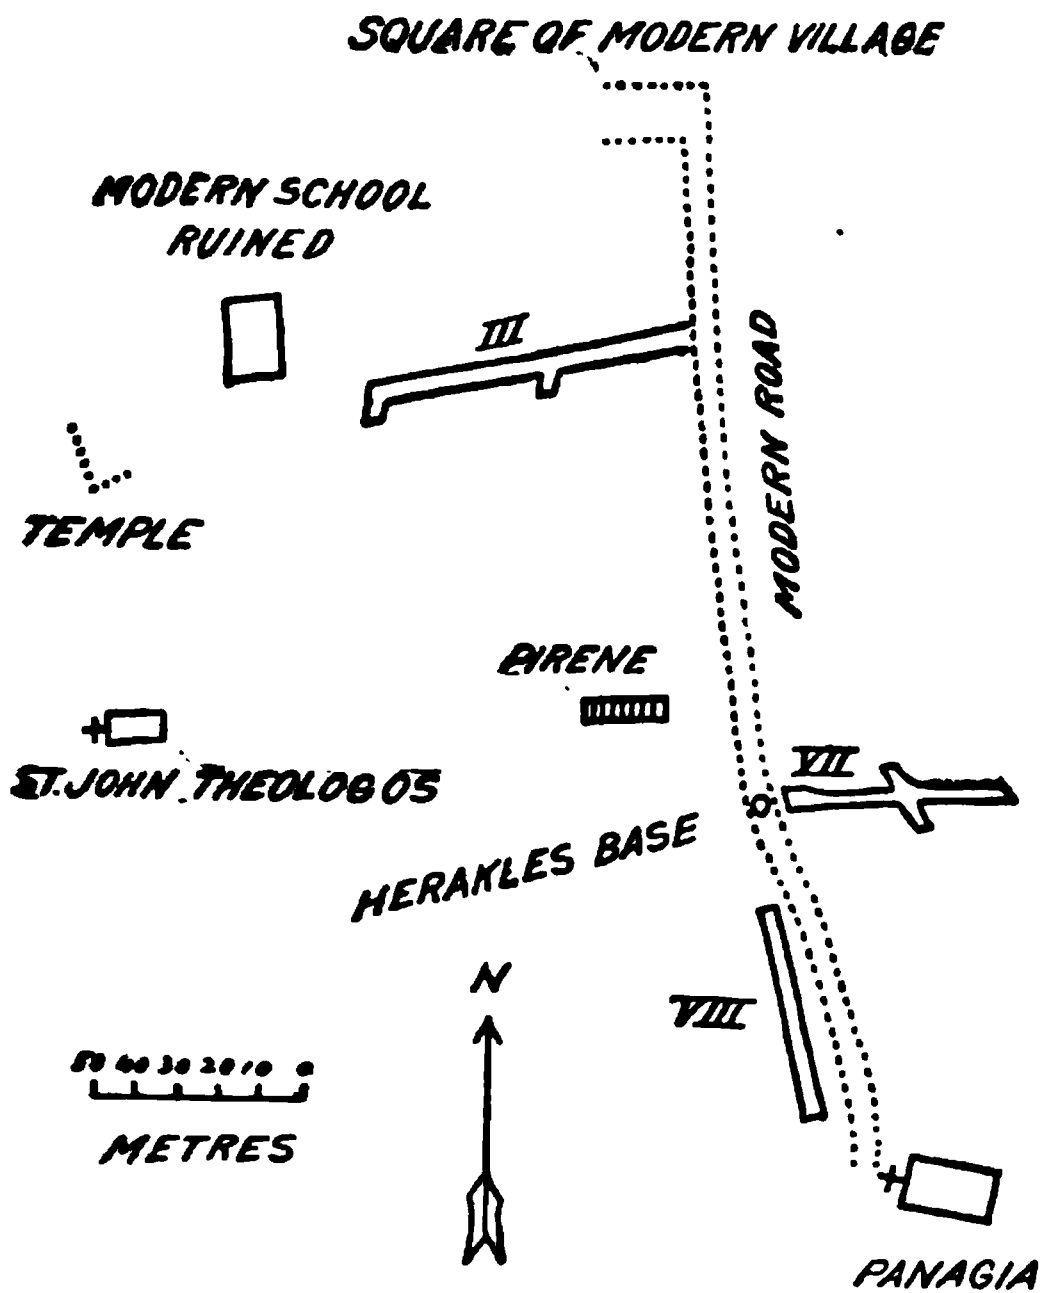

THE PYRENE AS IT APPEARS TO-DAY.

(Photography)

been confined within rather narrow limits, but has resulted in uncovering the foundations of a long building, probably a portico, and of an ancient paved road, which seems to end in a broad flight of marble steps leading up to the market-place. As the road can be traced in the opposite direction at several points there seems little room for doubt that this was the highway to Lechæum, the port of the city on the Corinthian gulf. The most important discovery, however, was the identification of the

fountain of Pirene, one of the most famous fountains in Greece, and a valuable point in Corinthian topography, since it was a little north of the market-place, on the road to Lechæum. The position of the market-place once determined, it is possible to give a name to the old temple, whose ruins have long been the most conspicuous land-mark of ancient Corinth. It is natural to identify it with the temple of Apollo which Pausanias mentions as on the right of the road leading to Sicyon. As the accompanying plate shows, the fountain was formed by cutting in the rock chambers at the rear of which was a channel from which the water overflowed. The front of the chambers was apparently faced with marble, and adorned by a portico with columns. It is said that three periods can be traced in the architectural remains, and that there is evidence for a much simpler delivery of the water through an arched channel before the elaborate spring-house was built. No important works of art have as yet rewarded the

excavators, though five large marble statues, unfortunately headless, and several reliefs, terra-cottas and architectural fragments have been found. Of the inscriptions, also but few in number, one belongs to the early days of the Corinthian alphabet, and another is interesting as being in all probability part of the lintel of the Jewish synagogue, for it bears the letters ΑΓΩΓΗ ΕΒΡ that is $[\sigma\upsilon\nu] \alpha\gamma\omega\gamma\eta \text{ Εβρ} [\alpha\iota\omega\nu]$. The great depth of soil which covers the ancient remains, and the valuable character of the land, which makes expropriation expensive, combine to make a thorough exploration of the site tedious and costly. Now that so fortunate a beginning has been made, it seems a duty to provide the means for further prosecution of a work which is certain to yield important additions to our knowledge of one of the most important commercial centers of the ancient world.

The number of foreign schools for archæological study in Athens has received an addition in the establishment of a branch of the recently founded Austrian Archæological Institute, under the direction of Dr. A. Wilhelm, already well-known as an epigraphist, and Dr. W. Reichel, the author of a brilliant work on Homeric weapons. Other representatives have been appointed at Smyrna and Constantinople, and the new school seems likely to take a prominent part in contributing to our knowledge of the remains of the ancient world.

The original representatives of that form of early civilization which is found so widely diffused in Greece, the islands of the Ægean and even further East, and which is known commonly as Mycenæan, still form the subject of discussion. While Helbig and some others seek the home of this very characteristic art in Phœnicia or Syria, Prof. Ridgeway has lately maintained that these remains represent the Pelasgian or pre-Homeric population of Greece who were conquered by the fair-haired Achæans, and in turn absorbed their conquerors, even as the dark-haired southern races had assimilated in later times the northern Goths, Normans and other invaders. On this theory the Pelasgian element predominated in Attica, Arcadia, and Thessaly, and in these regions we find marked traces of a different social and religious system from that revealed in the Homeric poems. This theory naturally

depends upon the discussion of a large number of minute details, and as yet has been scarcely more than outlined by its author, who promises a complete discussion in a forthcoming book on *The Early Age of Greece*. The relation of this people to Egypt has also been the subject of investigation, as recent discoveries in that country show that not only were Mycenæan artists influenced to some extent by Egyptian styles, but their wares were in turn imported to Egypt and in some instances inspired native Egyptian artists to imitation.

Another question which has long been under discussion also received a new contribution to its solution, in the recognition by Professor Dörpfeld of a new type of Greek theatre, which in his opinion corresponds very closely with the description of Vitruvius. To those who have accepted the recent theory that the Greek theatre contained no raised stage, but actors and chorus performed alike on the level of the *orchestra*, the explicit statement of the Roman architect has always offered a serious difficulty. The new type is prevalent in Asia Minor, and at first sight seems to resemble a Roman theatre, but on a closer inspection is seen to depart from the Roman model, in that the seats and orchestra form an arc greater than a semi-circle, the stage is always some distance from the diameter of the orchestra, varies from 8 to 10 feet in height, while the Roman stage was only about 5 feet high, and is distinctly narrower than was usual in a Roman theatre. This type probably was familiar to Vitruvius from the theatre of Pompey in Rome, which was copied from that at Mitylene. This view has of course been sharply attacked, but its author has defended his position with great clearness, and at present seems to hold the field.

VI. *Italy*.—While investigation and excavation are carried on in all parts of Italy under government supervision, the reports indicate that outside of Rome there has been comparatively little of importance discovered during the past year. In Sicily the work of Signor Orsi, extending over several years, has been largely confined to the uncovering of early graves, the contents and form of which furnish most of our knowledge as to the prehistoric population of Sicily. Orsi distinguishes four periods in this population, the first pre-Sicilian, the others Sicilian, with a distinct break between the pre-Sicilian and its successors. There is, however, as yet no agreement as to the latter point, others placing the gap between the second and third periods, calling the first two Sicanian the latter Sicilian, and others holding that the series is continuous. This last view has been maintained by Professor Petersen of the German Archæological Institute in Rome, who argues that the vase fragments show a regular development, as well as a survival of earlier forms in later periods, which is hardly likely if two distinct races are concerned. At Monte Tabuto, in southeastern Sicily, have been discovered prehistoric flint quarries, belonging to Orsi's first Sicilian period. In these low galleries had been excavated by means of stone implements and stakes of hard wood. Among the small objects found were flint knives, stone axes, and vases, some of which belonged to the transition from the first to the second Sicilian period. Tombs were also found in the neighborhood, sometimes hewn in the rock, and sometimes built of stone slabs on the surface of the ground. These latter were probably covered by mounds of earth. As remains of human dwellings are rare except in caves, it is of interest to note that the discovery is reported near Syracuse of the foundations of houses cut in the rock, along with flint fragments and pottery, but without traces of metal.

In northern Italy also our knowledge of the prehistoric civilization has been increased by the publication and discussion of the results of excavations carried on many years ago in the necropolis of Remedello Santo in the province of Brescia. This place contains not merely tombs belonging to the Gallic and early Roman time, but also remains of the pre-Gallic population, including graves and traces of dwellings of the neolithic age, as the period of transition between the later stone and the bronze ages is called. In this period the dead were buried (1) in caverns, either natural or excavated, and (2) in graves in the open fields. In the neolithic age natural caverns were sometimes used, and also graves in the open field frequently formed of stone slabs. In both periods there are often indications of a second burial, sometimes accompanied by coloring the bones of the dead. The burial rites and the objects laid by the dead were the same in both periods, except that no metal is found in the neolithic time. It is therefore natural to suppose that there was no change in the race occupying the country, only a more advanced stage of civilization due to the introduction of metals.

The whole system of chronology devised by Montelius, which has commonly been accepted for the duration of the Etruscan civilization, has been vigorously attacked by Dr. G. Karo with arguments which seem weighty. Montelius held that the Etruscan civilization extended from about the fourteenth to the sixth century before Christ, and could be divided into nine periods of about one hundred years each. Karo first attacks the close of the period and seems to show that this peculiar civilization could easily have lasted well into the fifth century. The other limit, based on Mycenæan vases found in Sicily is also un-

certain, as the date of this style of decoration is not yet determined with accuracy. The objects found in the rich Etruscan tombs, such as the Regulini-Galassi tomb at Praeneste, are in their style of decoration much more closely related to the art of the late seventh than to that of the ninth century. According to Karo four periods can be distinguished: (1) The ninth and early eighth centuries, when no Greek influence is seen, and pit graves were in use. (2) The eighth and first part of the seventh, when trench graves are found containing imported vases and bronzes with geometric decoration. (3) The latter part of the seventh and early sixth centuries, when the first great Greek importations are found with decorations under Oriental influence. This is the period of the circular and corridor tombs, with their rich contents. (4) The sixth and fifth centuries, marked by a further great Greek importation, showing especially the development of the black-figured vases. This is the time of the chamber tombs.

The chief results of the year in Italy have been obtained in the Roman Forum, where the government has entered on the task of setting in order this somewhat neglected spot. The mound of earth covering the temple of Vesta, and supposed by some to be in part due to the reconstruction of Severus, has been removed, thus bringing to light the steps of the temple, and some interior walls. It is interesting to read that deep in the foundations was found a small fragment of a Greek vase, made about the middle of the fifth century, and probably of the kind used in the service of the temple. Two more interesting discoveries have been made by Signor Boni. The first is that of the spot where the body of Julius Cæsar was burned. When Augustus built the temple of the divine Julius, he did not cover this place, but left a semi-circular recess in the front of the podium, and there on the original travertine pavement are the remains of the base belonging to the column erected to mark the site. The other discovery is the uncovering near the Comitium of a pavement about twelve feet square paved with black marble slabs, and enclosed by a travertine curb. This must be identified with the black stone marking the grave of Romulus, or as other ancient writers said the grave intended for Romulus but used after his death for Faustulus and Quinctilius. Not only have these excavations been made, but much has been done toward improving the appearance of this centre of the ancient city by reconstructing such monuments as can be restored from their fallen fragments. No conjectural "restoration," usually so misleading, seems to have been allowed, and the result can only be welcome to lovers of ancient art.

VII. *Switzerland and Germany*.—Roman remains in Switzerland are by no means rare, but the discovery recently made at Baden near Zurich is unique. According to the reports this is nothing less than an ancient hospital, with fourteen rooms, in which were found surgical instruments of many kinds, as well as spoons and measuring vessels, jars and bottles. As two legions were stationed here it seems likely that this is the military hospital, and as no coins later than those of Hadrian have been found, it is probable that it was abandoned during the second century. Surgical instruments, and medicine jars are no great novelty—the House of the Surgeon in Pompeii is well-known—but a hospital system among the ancients has been much debated, and a military hospital was unknown, even from literary sources.

In Germany the chief work of exploration is still devoted to the *limes*, the Roman boundary wall carried from the Rhine to the Danube, as an earthen rampart with frequent towers a short distance back, and at greater intervals fortified camps. In spite of the apparently perishable character of the work, it has been traced over a good part of its course and many of the forts and towers uncovered. The silver treasure found long ago at Hildesheim, and preserved in the Berlin Museum has lately been carefully studied and the fragments united, so that the original appearance of the vessels has been in large measure restored. The style is too simple to have attracted the German taste of the early imperial time, and yet they were found far from any Roman post. In number and character they seem to be suitable for a table service for three persons, and probably formed the traveling set of some Roman officer of high rank, though not the very highest, who in some moment of peril buried his treasure. The style of the vessels indicates the taste which prevailed in the Augustan age, and there seems nothing to require us to assign any vessel to a later time.

VIII. *France, including French Africa*.—At Martres-Tolosane, about 40 miles above Toulouse, there has been discovered what was at first reported as a Roman city. Further details seem to indicate that it is merely a collection of villas, 10 in all, within an area of about 35 sq. km. One of these is of unusual size and richly adorned with sculptures of the first and second centuries of our area. These decorations are not merely architectural, but include 70 statues, a number of small reliefs and 65 busts of emperors and nobles from the time of Augustus to that of Gallienus. The other villas yielded less interesting results, but there seems good reason to believe that in the large villa has been discovered the residence of the procurators in charge of the imperial property in the upper valley of the Garonne.

In Tunis the work of exploration, under the supervision of the French Academy, and the government, goes steadily forward. The discoveries announced during the year have centered near ancient Carthage, where in 1896 Father A. L. Delattre excavated, at Bir-ez-zitoun, a cemetery containing successive layers of graves from the end of the Republic, soon after the foundation of Roman Carthage, to the second or perhaps third century of our era. In some of the earliest graves were found sculptured *stelæ*, of a type hitherto supposed to be Punic, and this similarity to the pre-Roman work extended to some of the vases and lamps. The later tombs are marked by a sort of cippus, connected by an earthenware pipe with the cinerary urn beneath, so that the liquid offerings to the dead might thus flow to those below the earth. Below these urns were found many small objects of metal and terra-cotta, including a number of copper coins. As the latter were obviously of much earlier date than the graves in which they were found, it looks as if the thrifty Romans paid Charon's fee in coin no longer current in the upper world. The same excavator has reported more promptly on his discoveries in another village, Bordj-Djédid, near Carthage, where the Punic necropolis has been found, and many tombs opened. They are in the form of rectangular pits containing one or more chambers, and resemble the graves of Sidon. A large number of fragments of sculpture, coins, terra-cottas, and small objects in metal were found, and also two sarcophagi, one having the figure of a bearded man in high relief on the cover, and the other with the inscription, "Baalchillek the Rab." Other tombs in the same neighborhood have yielded more small objects, including some Greek terra-cottas, and the soil above the graves has furnished the longest Punic inscription from this neighborhood, a dedication to Ashtoreth and Tanit of Lebanon of certain sanctuaries and their contents, which are carefully noted. As these excavations are by no means complete, new discoveries from the old Phœnician city may be expected. To the Virgil mosaic and other specimens of African art, have been added two of decided interest. One from the neighborhood of Carthage is of large size (7m.x5½m.), and shows in the centre a sacrifice by six hunters before a temple containing statues of Apollo and Diana. Around this design are smaller fields with hunting scenes. The other comes from near Medeina, and is cruciform. The arms are occupied by a head of Oceanus, a reclining river-god and marine views, and the centre by a picture of 25 ships sailing on a blue sea. Each ship bears the name of its type in Latin, and sometimes in Greek, and there are a few appropriate Latin verses, some of which are new. Eight of the types of the ships are new, and fifteen more were previously known only by name.

IX. *Spain*.—Late in 1898 the Louvre announced the reception of a very remarkable piece of sculpture from Elche (ancient Ilici) in Spain. It represents a woman in the native costume, with the curious wheel-shaped ornaments covering the ears, as Strabo describes them in his account of the strange fashions prevailing in Iberia. The head shows distinctly the influence of the later Greek archaic art, and more especially that of Ionia, which is to be expected, as the Greek colonists in Spain were Ionian. This same influence is noticeable in some small bronzes from the neighborhood of Cerro de los Santos, which also show the women with heads covered by veils which, however, do not conceal the characteristic ornaments over the ears. As the head from Elche is of native stone, it may be the work of a native artist familiar with the work of his Greek neighbors, or possibly of a wandering Greek sculptor. Its date is uncertain, but it cannot be earlier than the fifth century, and may well belong to the end of that period.

X. *England*.—The most important archæological researches in England for some years have been the excavations of the old Roman town at Silchester, which have been conducted systematically for six months in each year since 1890, and have already laid bare about one-half of the site. The fact that the land is under cultivation makes it necessary to replace the soil at the end of each season, but very careful plans and drawing are prepared, and all objects found are removed to the Reading museum. As the ancient streets can be traced by the poor growth of the crops above them, the town has been divided into blocks or *insulae*, and these are being examined in regular order, the south-west portion of the area being the section chosen for 1898. Besides the usual smaller houses, a large dwelling with nearly perfect heating apparatus, or *hypocausts*, was found, and in its courtyard the traces of an earlier house. Indeed it is by no means unusual to find evidences of alterations and rebuilding, natural enough during the long period of habitation, for the architectural fragments are said to show that the town existed from the time of the Antonines to the very end of the Roman occupation. It is supposed that the site represents the town, called in the Antonine itinerary Calleva Atrebatum, but as yet no inscription has been found to throw light on the name or history of the place; indeed the epigraphic results of the investigations have been most disappointing.

ARCHÆOLOGY (AMERICAN). Until about 1880 archæologic inquiries in America were conducted in accordance with ideas developed by European students;

then, with the extension of ethnologic researches among the native races, original ideas took shape, and the method of interpreting prehistoric relics through observation of primitive peoples was gradually substituted. With the adoption of the improved method, it was perceived that archæology can hardly be regarded as a distinct science, but rather as that branch of technology dealing with prehistoric products of æsthetic and industrial handicraft. Through these advances, archæologic inquiry in America received great impetus and began to yield the results summarized in the following paragraphs:

Mounds and Earthworks.—The researches of Thomas and others have shown that the artificial mounds and other earthworks of the Mississippi valley are in no way different from earth-structures sometimes seen in process of erection by early explorers, and contain no artifact types distinct from those found in use among the Indians (except beads of Venetian glass, hawk-bells of alloyed metal, and other objects of European origin found in a few of the tumuli;) accordingly it has been made clear that these structures are not the work of ancient peoples of high culture as once supposed, but of Indians corresponding in culture and habit to those found in the region by the settlers. Some earthworks are of geometric form, including circles and squares, but careful surveys have shown that the accuracy of the figures was overestimated by some early observers, and is of a degree readily attainable by Indians of average intelligence. Many of the upper Mississippi mounds are in the shape of animals, outlined in low relief on greatly magnified scale; some of the forms have been thought to represent extinct species, though the supposition is hardly borne out by careful measurement and analysis; these effigies appear to represent the totems or beast-deities of the tribes occupying that region up to the advent of the white man. The crania and other osseous remains found in the mounds have been shown by Putnam and others to present a considerable variety in type, ranging from dolichocephalic to brachycephalic; but the cephalic types have not been identified with distinct tribes or groups of aborigines. Remarkable earthworks have been brought to light by Cushing in southwestern Florida; some of these are mere refuse heaps accumulated beneath and about pile-supported habitations, and are significant in suggesting the origin of the custom of building mounds as sites for houses and temples in lowland districts; others, both on the insular keys and the mainland, are built of carefully-laid shells in such manner as to afford sites for villages, with canals and harbors for watercraft. Relics of the builders, preserved in remarkable perfection in the adjacent tumuli and muck-beds, betoken a high stage of aboriginal culture, corresponding to that noted by the earliest Spanish explorers, yet suggesting affinities with the aborigines of the Antilles and South America, as well as with more northerly tribes; symbolic devices abound; the implements are chiefly of tooth, shell, bone, and wood (reminders of the culture stage called "prelithic"); the watercraft were wooden canoes so large as to imply perfected social organization, and doubled for sea-going; while the graphic devices and other symbols record ceremonial institutions and fiducial customs related to those found among well-advanced tribes in other parts of the country. The shell-mounds or *mi dens* of the Atlantic and Pacific coasts have yielded abundant aboriginal material, throwing light on the habits and customs of the native tribes; during the last half of the decade, those of Chesapeake bay have been examined by Holmes, those of Maine by Powell and others, those of British Columbia by Boas, and those of Sonora by McGee; a remarkable midden (forming Punta Antigualla in the Gulf of California) in the land of the Seri Indians, covering 75 acres to a height reaching 90 feet, although largely cut away by the sea, is of peculiar interest in that the contained artifacts, alike from summit to base, represent the exceedingly primitive culture of the savage Indians still inhabiting the region. The artificial mounds of the arid plains in southwestern United States and northern Mexico, explored by Mindeleff and others, contain remains of aboriginal villages and temples related to those still extant in the same region; the associated ancient cemeteries explored by Fewkes have yielded unprecedentedly rich collections of symbolic pottery.

Stone Art.—During the decade 1885-1895, Holmes investigated the aboriginal methods of quarrying, manufacturing stone implements and utensils, and distributing the artifacts; the principal area of study was the middle Potomac region, though the inquiries extended throughout the United States. The quarrying operations of the Indians were extensive; in different localities the stripping reached acres; in North Carolina, Virginia, and Maryland steatite veins were worked (for soapstone utensils) to depths of 20 to 50 feet; in the Lake Superior region mines for native copper were sunk over a hundred feet. The pebble beds of the Potomac formation about the site of Washington were worked largely for quartzite pebbles and cobbles; these were rough-dressed on the quarry-sites and the product (long known as *palæoliths*) transported to shop-sites for final shaping into blades used as knives, arrowpoints, spear-heads, etc.; while the finished implements were distributed by exchange and the exigencies of war and chase. These processes traced in the District of Columbia were

afterward found characteristic of other provinces and of various living tribes. The inquiry demonstrated that the European classification of stone artifacts, and corresponding division of prehistoric time, as palæolithic and neolithic, cannot be applied to America; and Professor Holmes' investigation attracted wide attention, and brought him, in 1898, the first Loubat prize awarded decennially for the most notable contribution to archæology and ethnology. Guided partly by the prehistoric and modern stone work of the Seri Indians, McGee followed Holmes' demonstration with the classification of American stone artifacts as (1) "protolithic," and (2) "technolithic;" the first class being devoid of mechanical design, and comprising stones of natural form chosen at random or through the suggestion of myth and shaped as an incident of use, while the second class were shaped purposely in accordance with antecedent design. The two types, together with the type of artifacts called "prelithic" by Cushing, stand for stages in cultural development among given peoples, though they existed contemporaneously among different groups at the advent of the whites and the opening of written history. Besides the implements and weapons of hard and tough stone, the Indians left in their tombs various symbolic or ceremonial objects, including pipes, gorgets, beads, and pendants, often carved from slate, steatite, catlinite, and other soft stones, as well as trays, pots, and pannikins of steatite; while in many districts stone mortars and pestles were common, as were metates and manos in southwestern United States and Mexico. The mortar district of the northern Pacific coast passes into the metate district of the southern coast in California, where a series of transitional types (partly protolithic) were brought to light in 1898.

Metallic Artifacts.—From mounds and graves and surface finds, prehistoric implements and ornaments of metal have been obtained in considerable numbers. The most abundant metal is native copper, which was forged cold or at low heat into tools or weapons imitating those of stone in form, or into various symbolic designs. In southwestern United States and also in Mexico, Central America, and South America, native silver and gold were similarly wrought; in the more southerly districts these metals sometimes were worked hot and even partially fused; but no decisive evidence has been found that the aboriginal Americans understood smelting or alloying. In the Mississippi valley and elsewhere meteoric iron (which is usually hot-short, and thus workable only cold) was evidently prized highly for ceremonial objects; and in Mexico and elsewhere mirrors of polished nodules of pyrite were used apparently as insignia.

Evidence of Human Antiquity.—Up to 1880, American archæologists were impressed by records of human relics associated with geologic deposits in such manner as to indicate the high antiquity of man on the western hemisphere. The instances were critically examined, chiefly by Holmes and Brinton, and the supposed evidence was found untrustworthy in nearly all cases and doubtful in others; the quartz chips reported from deposits of glacial age at Little Falls in Minnesota were seen to be either superficial or lodged in a talus; similar conditions existed at Trenton, where also the artifacts have been shown by Holmes and the crania by Russell to belong to types represented by the local Indians at the time of settlement. In 1898 Holmes and McGee visited the Calaveras region in California, whence the strongest suggestions of high human antiquity had come, and found that most of the artifacts reported from the auriferous gravels were of stone more recent than the gravel formations, and were of the specialized type used by existing Indians and scattered by them over the surfaces subsequently disturbed by the hydraulic mining operations. Researches in the caves of eastern United States by Mercer and Cope also failed to reveal such association of human remains with those of extinct animals as are frequently reported from Europe. On the whole, it seems probable that America was peopled by the ancestors of the Indians some thousands of years ago, perhaps soon after the melting of the last Pleistocene glaciers; but there is no decisive evidence of man's existence in America during any geologic age beyond that called Recent or Modern.

Habitations and Temples.—In southwestern United States structures of stone and adobe, like those of modern Pueblos, together with cliff houses and cavate lodges (excavations in soft layers in the cliffs) have been described by Powell, Mindeleff, and others; associated with these, as with the modern structures, are kivas or subterranean temples containing ceremonial articles and other relics serving to establish a genetic relation between the prehistoric folk and those of the present. In 1897 Hodge ascended Mesa Encantada in New Mexico, long regarded as inaccessible, and verified an ancient tradition of the neighboring Acoma Indians by finding distinctive artifacts scattered over the summit. A southwestern relic of especial note, as the largest prehistoric adobe structure in the United States, is Casa Grande ruin, near Florence, Arizona; it has been reserved recently by the government and placed in charge of a custodian. Among the most imposing aboriginal habitations and temples of the western hemisphere are those of Mexico and Central America, especially those of Yucatan; between 1890 and 1900 new light has been thrown on Yucatan

ruins through researches by Maudsley, Holmes, and others, while the prehistoric structures of Honduras have been investigated energetically through the efforts of Putnam and his collaborators. Maudsley and Putnam have published elegant and faithful reproductions of decorative and other features of the singularly ornate structures; while Holmes has issued effective panoramas of the ruined cities of Yucatan and the valley of Mexico, giving clear conceptions of their extent and indicating architectural motives. Throughout America, the greatest structures were temples for fiducial ceremonies (even the best-organized aboriginal governments being essentially fiducial;) the architectural methods exemplified the earlier stages in the development of the arch and other structural motives; the implements employed in the stone-carving and stucco-molding were of stone and wood, no metal being employed as material and little if any as constructive appliances.

Prehistoric Surgery.—About 1890, Muniz made a rich collection of prehistoric crania in Peru, many of which were trephine; they were studied by the collector and later by McGee. These and other trephined crania from Peru and one obtained by Humboldt from Mexico, with material from other countries, show that one of the most delicate and difficult operations of modern surgery was even more common among some prehistoric peoples than it is to-day, though the methods were crude and the motives thaumaturgic rather than surgical. Other osteologic material from prehistoric graves records crude attempts at restoration of injured bony tissue; all of the processes being in accord with the essentially thaumaturgic medicine of the tribes surviving in recent times.

Irrigation and Agriculture.—Researches in the arid regions of the United States by Cushing, Mindeleff, and others have shown that certain aborigines attained considerable skill in irrigation and introduced reservoirs and acequias of great size; these extensive systems have been traced several hundred miles southward into Mexico, and they appear to extend thence through Mexico and Central America, where conditions fit, to find their fullest development, in connection with elaborate roadways, in Peru. These works, together with other facts, indicate the development of agriculture on an extensive scale in the arid lands of America, and point out the way in which the products and method were diffused thence into more humid areas. Remains of corn, beans, squash, and tobacco have been found preserved in prehistoric graves or structures; and the petroglyphs and corrals indicate that the turkey and dog, and apparently the guanaco, were domesticated before the advent of the white man.

ARCTIC EXPLORATION. The interest in Arctic exploration in 1898 was the culmination of an enthusiasm for northern discovery that has constantly increased during the last ten or twelve years. In the latter part of 1897 and the early part of 1898, the interesting narrative of Herr Professor Fridtjof Nansen in *Farthest North*, and the appearance of the explorer himself on our lecture platform made familiar to the popular mind the story of the daring Norwegian's drift in the *Fram* through the Polar Sea north of Siberia, and his final advance by sledge to lat. 86° 14', the farthest point north hitherto reached, being only 260 miles from the Pole. The public interest aroused in 1897 in the Andrée balloon voyage continued in 1898. The following is a brief account of this novel venture.

The Andrée Voyage.—In the summer of 1897 Herr S. A. Andrée, a Swede, made his famous attempt to reach the North Pole by balloon. Before 1890 Herr Andrée had conceived the idea of utilizing the air currents for purposes of transportation, and at that time experimented in ballooning. In both 1893 and 1894 he crossed the Baltic in a balloon, though in the latter year involuntarily. In February, 1895, he presented his matured plans to the Swedish Academy of Science, and in the following August he addressed the International Geographical Congress at London with such clearness and force that the scientists were convinced of the feasibility of his plan. In 1896 the voyage was attempted, but was given up on account of unfavorable winds; Andrée, however, erected on Dane's Island a balloon house, 85 feet high, which he found the following summer but slightly damaged. This voyage of 1897 was made possible by the generosity of some of his former patrons, including King Oscar II of Sweden. The balloon was enlarged slightly so that its dimensions were 22 by 23 metres and its capacity about 5,000 cubic metres. The party, having left Guthenburg, May 18, on the gunboat *Svenkrund*, the cargo-steamer *Virgo* accompanying them, sailed on the 26th from Tromsø, Norway, and came in three days to Dane's Island, which is near the 80th parallel. Although they encountered much difficulty from storms, by July 1 everything was ready for the balloon ascension, but it was not until the 11th that the wind was favorable. On this day with all his equipments, including scientific instruments and carrier pigeons, the daring Swede accompanied by his friends Dr. Strindberg and Herr Fraenkel, was wafted away before a strong southwest wind in the great balloon with its five tons burden.

On July 15, the whaler *Alken* took a carrier pigeon bearing the following message: "July 13th, 12:30 o'clock noon. Lat $82^{\circ} 2'$, long. $15^{\circ} 5'$ east. Good speed eastward, 10° to south. All well on board. This is the third pigeon-post.

"Andrée."

The authenticity of this message was vouched for by Mr. Jonas Stadling, who accompanied Andrée to Dane's Island, knew the kind of paper to be used, and was familiar with Andrée's handwriting. It is difficult to understand how such little progress was made in about 44 hours, for a strong wind was blowing. When we consider that thus two days of the precious fifteen or twenty that the balloon could remain afloat were used with little effect and that at the time of sending the message they were going in a direction a little south of east, it seems fair to conclude that the balloon never crossed the Pole, and that the practicality of Andrée's theory of the utilization of aerial currents for arctic transportation has not been demonstrated. A party sent in search of Andrée returned having found no traces of him.

Expeditions in 1898.—In 1898 five Arctic expeditions were undertaken. Mr. Frederick Jackson, an Englishman, having returned in the fall of 1897 from Franz

ADVANCE MADE TOWARD THE NORTH POLE DURING THREE CENTURIES, WITH PROPOSED ROUTES OF PEARY AND WELLMAN.

(By courtesy of the *Review of Reviews*.)

Josef Land, planned another northern voyage which he began in the summer of 1898. His route was along the western coast of Greenland and through Jones Sound, his intentions being to explore the unknown lands supposed to be to the north and west. Captain Otto Sverdrup, who was with Nansen, having secured the loan of the *Fram* and a subsidy from the Swedish government, sailed from Christiania, June 24. In the expedition were a number of European scientists who proposed to make observations along the coasts of Greenland and Grinnell Land. Although Captain Sverdrup intended to go north through Smith Sound, it was said that he did not expect to reach the Pole. Another Swedish expedition also went north under the com-

mand of Dr. A. G. Nathorst, who accompanied Nordenskjöld in his Greenland expedition of 1883. The Arctic expedition of Mr. Walter Wellman sailed from Tromsø, Norway, June 26, in the ice-steamer *Fridtjof* with a crew of nine men. Mr. Wellman, who is an American from Ohio, has for years been interested in Arctic discovery, and in 1893 tried to reach the Pole, but his ship was crushed in the ice and he returned in 1894. The expedition of 1898 was a repetition of his former attempt, the base of supplies, however, being in Franz Josef Land instead of Spitzbergen. Mr. Wellman's chief purpose was to find the Pole, but he also hoped to see some trace of Andrée, while the scientists accompanying him, among whom were Professor Gore of the Columbian University, and Lieutenant Baldwin of the Weather Bureau, expected to make surveys and scientific investigations, especially in gravity and magnetism. The expedition, having taken supplies and Siberian draft dogs at Archangel, put about for Cape Flora, expecting to reach there between August 1 and 15. At this point a supply station was to be located. The scientists were to go no further north, but Mr. Wellman with five others, all of whom were probably Norwegian seal and walrus hunters, expected to go on, wintering near Cape Fligely, which is 550 statute miles from the Pole. In the spring of 1899 the dash for the Pole would be made.

The Peary Expedition.—It is likely that Lieutenant Robert C. Peary's expedition will prove to be the most important of the year. Lieutenant Peary's account of his Arctic explorations. *Northward Over the Great Ice*, was published in the spring of 1898. A *résumé* of these expeditions may enable one better to understand the plans and purposes of the great voyage of this year. His first Greenland expedition was made in 1886, while the most important hitherto are those of 1892 and 1895. From '93 to '95 he made a number of unimportant excursions with three or four persons beyond the ice-cap. His attempt in '95 to make a sledge journey across northern Greenland, though successful, was attended with great suffering and was so disastrous that Peary was two years in recovering from its effects. In 1896 he made a sixth voyage to Greenland for the purpose of bringing back the 100-ton meteorite at Cape York but on account of the ice he was unsuccessful.

The experience gained in these years of Arctic exploration led Lieut. Peary to introduce new and successful methods of procedure. The important features are—the utilization of the inland ice as the road, with but two or three in the party, the supplies being carried on sledges by quite a large number of Eskimo dogs. A large proportion of these dogs are gradually fed to the others. Lieut. Peary says that the maximum value of this plan would be, "that the two men would subsist during the last four or five days of their return march upon the flesh of their last dog, he previously having eaten all his comrades. This maximum value was nearly reached in my 1895 journey." In this journey of 1895, he exhausted the possibilities of his overland method in Greenland, having reached the northern land limits. On account of this he planned his great expedition of 1898 across the ice of the Polar Sea north of Greenland, still adhering to the methods already developed, with the exception of the inland-ice route, but ready to modify them as occasion might demand.

From the fact that Jackson and Nansen, returning from their expeditions, announced that Franz Josef Land was not an Arctic continent but rather a small archipelago, and from the fact that the *Fram* in drifting three years through the Siberian segment of the polar basin came in sight of no land to the northward, Lieut. Peary concluded that the Pole could be reached only in some other way. As the land north of the mainland of Greenland was the most northern known, he determined to make this his base, his route being through Smith Sound, Kane Basin, Robeson Channel, and along the northwestern coast of Greenland. He planned to force his way by ship to Sherard Osborn Fiord or farther, land his people and stores, and send the vessel back; by advancing northward as soon as the freezing of the ice would allow sledge travel, he expected to be at the northern terminus of the North Greenland Archipelago with his party and most of his supplies in the early spring of 1899. This is in latitude about 85° or 330 statute miles from the Pole. From this point the last stage of the journey would be made over the frozen sea with two Eskimos, picked dogs, and light equipment. Should the ice conditions, however, prove unfavorable, he would be prepared to wait a year or a number of years; while the ship would return each summer, or every other summer, with supplies. While waiting for favorable conditions, a detailed survey of the Archipelago could be made. The special points in favor of Lieut. Peary's plan are: The employment of native Eskimos, who have learned to know and love Peary and in whom he can trust; a fixed point of return, rather than Nansen's plan of a drifting ship, and stores at each prominent headland; the assurance of the possibility of retreat without help from the ship.

In the spring of 1897 Lieut. Peary secured a five years' leave of absence from the Navy Department, and in the summer made a preliminary voyage to confer with the tribe of Smith Sound Eskimos and have them prepare to help him in 1898. The

Hope sailed from Boston, July 19; Peary touched at Cape York and took aboard the great meteorite that he had failed to obtain the previous year. He brought it to New York. The Eskimos, selected for the colony at Sherard Fiord, showed much childish enthusiasm to undertake the expedition, and were all tried men personally known by Lieut. Peary. The fact that he determined to work as simply as possible, to follow in the main the customs of the Eskimos, to live in snow houses, and to make the last stage of his journey with "the smallest party with lightest equipment and the fewest necessities," leads one to await the result of this expedition with no small degree of expectancy and hope. Lieut. Peary has the endorsement of the Royal Geographical Society of London, the Royal Scottish Geographical Society of Edinburgh, and the American Geographical Society.

ARGENTINA, a republic on the Atlantic coast of southern South America, comprises fourteen provinces and nine territories, whose aggregate area is estimated at 1,778,195 square miles, and whose population according to the census of 1895 was 3,954,911. There are about 30,000 Indians. There has been a steady increase of the population since the year 1869 (4.6 per cent. per annum) and the statistics of immigration since 1892 would seem to show that the rate of increase is growing. In the consular report of January 1898, a letter from the minister of the United States to Argentine Republic, bearing date of September 22, 1897, gives some important data regarding the immigration into the Argentine Republic during 1896. The total was 164,218, of whom 75,204 were Italians, 18,051 Spaniards, 3,486 French, 1,039 Germans. The other nationalities in the order of their importance were Austrians, Turks, Swiss, Russians, English, Belgians, and Moors. The number of immigrants from other nations was in each case less than 200. In religion the great majority of the immigrants were Roman Catholics and in profession a great majority were agriculturists. The immigration since 1873 has fluctuated considerably. In the five year period 1873-77 the immigrants numbered 253,965. In the period from 1888 to 1892 they numbered 652,526. The foreign inhabitants of Argentina in 1895 numbered 1,004,527. The largest and most populous province is Buenos Ayres, which, exclusive of the city of the same name, has an area of 63,000 square miles and a population of 921,168. The province Jujuy is the least populous (49,712), averaging 1.8 a square mile. The largest and least populous district is the territory Santa Cruz, whose area is 182,500 square miles and whose population is placed at 1,058, or .005 a square mile. In 1897 the capital, Buenos Ayres, had a population of 726,917, of whom over 346,000 were foreigners. Other cities of importance, with populations for 1895, are Rosario, 94,025; Cordoba, 47,609; La Plata (which is the new capital of the province of Buenos Ayres and was founded in 1884), 45,410; Tucuman, 34,300; Mendoza, 28,709; Santa Fé, 24,755; Paraná, 24,261; Salta, 16,600; Corrientes, 16,129; San Juan, 10,410.

Government.—According to the constitution which was adopted in 1853 and modified in 1860, and which with a few exceptions is like that of the United States, the executive authority is vested in a President chosen for six years by an electoral college representing the fourteen provinces and having twice as many members as there are Senators and Deputies combined. He is commander-in-chief of the army. He is assisted by a ministry, appointed by himself, and which with himself is responsible to Congress, consisting of five departments, namely, the Interior, Finance, War, Foreign Affairs, Justice, and Agriculture. The President in 1898 was Don Julio A. Roca. The legislative authority devolves upon a Congress of two houses, a Senate and a House of Deputies. The members of the former number 30, two being elected by the legislature of each province, and two by special elections at the capital. The Deputies, elected by popular vote, are 86 in number. Deputies are chosen for four years and Senators for nine. The latter must have an annual income of 12,000 pesos. Congress meets each year from May 1 to September 30. The provinces elect their own legislators and governors and may contract loans on their own responsibility. Each State has its own judicial system, but the constitution provides for trial by jury in criminal cases. There are local and inferior courts, and a court of appeal, known as the Supreme Court, consisting of five judges and an attorney-general.

Finance.—The revenue and expenditure of Argentina have been as follows:

	1894.		1895.	
	Pesos Gold.	Pesos Paper.	Pesos Gold.	Pesos Paper.
Revenue	28,255,719	21,142,921	29,805,651	28,958,460
Expenditure	19,950,193	72,015,214	24,165,239	83,933,386

	1896.		1897 (estimated).	
	Pesos Gold.	Pesos Paper.	Pesos Gold.	Pesos Paper.
Revenue	32,052,951	29,468,174
Expenditure	46,891,221	92,122,343	19,957,402	83,335,168

	1898 (estimated).	
	Gold Pesos.	Paper Pesos.
Revenue	32,049,454	40,546,009
Expenditure	19,957,402	92,159,745

The principal sources of revenue are import and export duties, internal taxes, railways and public works, and stamps; while the heaviest item of expenditure is interest on the national debt. This debt at the beginning of 1897 was: External, about 316,000,000 pesos gold; internal, 91,861,000 pesos gold, and 82,374,994 pesos paper; total about 490,000,000 pesos. Each province and municipality has its own budget. The provincial debts in 1895 amounted, with arrears, to 137,261,866 pesos gold, and the municipal debts to 24,596,422 pesos gold. In 1895 a law was passed providing for the unification of the national debt and the provincial foreign debts.

In August, 1897, the paper currency amounted to 285,115,964 pesos. There are many private banks in Argentina and fourteen state banks. In 1891 a law was passed placing the old National Bank in liquidation, and the new bank of the Argentine nation, having a capital of 50,000,000 pesos, was opened in December of that year. The paper currency in August 1897, amounted to 285,115,964 pesos. The peso is valued at \$0.965 United States currency.

Army and Navy.—The standing army in time of peace is reported to consist of 945 officers and 12,073 men, while the number of the effective army, according to a statement before Congress in 1897, should be 29,513 officers and men. Efforts are made to drill at intervals the national guard, which numbers about 480,000. Besides a school for non-commissioned officers, there is a military school with 125 cadets.

Of the South American navies those of Brazil and Chile alone excel that of Argentina. It consists of 2 monitors, 2 first-class cruisers, 3 second-class cruisers, 3 armored cruisers, 11 smaller cruisers, gun-boats, etc., and 12 first-class and 10 second-class torpedo boats. The complement is placed at 1,530 officers and men. Among the more important vessels are: the armored cruiser *Almirante Brown*, built in 1880, displacement 4,200, nominal speed, 14 knots; the cruiser *Nueva de Julio*, built in England in 1892, displacement 3,575, nominal speed 22.5 knots; the second-class cruiser *Buenos Ayres*, displacement 4,500, trial speed 23.2 knots. The powerful armored cruisers *San Martin* and *Garibaldi* (displacement each 6,500) were bought of Italy. All of these vessels are well armed. The navy contains other vessels of remarkable excellence. There is a naval school with 60 cadets, and a school of gunners with 80.

Industries.—Agriculture and the raising of cattle are the chief industries of the country. The former, however, is in a backward condition, the area of tilled land in 1895 being about 15,000,000 acres, or 6.2 per cent. of the area available for cultivation. The efforts made to improve agriculture in recent years have not been attended with very great success. Wine was produced in 1895 to the amount of 42,267,200 gallons; raisins, 10,582 tons; alcohol, 478,800 gallons. The estimated sugar crop in 1897 was 110,000 tons. Wheat is a staple product, the yield for 1897 being 1,500,000 tons; in the same year maize and flax amounted to 400,000 tons. Cattle in 1895 numbered over 21,700,000 and sheep 74,380,000. These immense herds furnish large items of export. The census report of 1895 places the number of flour mills in the country at 532; distilleries, 108; wine factories, 852; breweries, 44; sugar plantations, 2,749; vineyards, 6,514; sugar mills, 48. A Jewish Colonization Association has acquired agricultural lands amounting to 318,000 acres in the provinces of Buenos Ayres, Entre Rios, and Santa Fé. The mineral resources of the country are not important, petroleum is obtained in Mendoza. The domestic demand for coal and oil is for the most part supplied from abroad. Coal, however, has been discovered in Terra del Fuego, and samples of it were tested in 1898 at Buenos Ayres with satisfactory results. As this coal, which was taken from the surface merely, was of such excellent quality, it was thought that the prospect was promising. A large and accessible supply of coal would stimulate manufacturing to a high degree. It was proposed to send down machinery and find out how much of the coal was available. Virginia coal has been sent to the Argentine Republic and has proved acceptable. Thus a trade has been started in this mineral and much is expected from it. An agency for United States coal has been opened at Buenos Ayres. In 1896 the value of the mineral produce exported from Argentina was placed at 352,840 pesos.

Commerce.—The following gives the value in pesos of exports and imports for 1894-96:

	1894	1895	1896
Exports	101,249,000	118,937,000	115,670,964
Imports	92,724,000	94,856,000	112,058,002

More than 86 per cent. of the imports in 1896 passed through Buenos Ayres. The principal exports in 1896 were valued in pesos as follows: Produce of the herds,

70,534,040; farm produce, 36,963,480; manufactured products, 6,169,105; forest produce, 1,268,663; mineral produce, 352,840. Among the chief imports for the same period were: textiles and clothing, 38,413,839 pesos; iron, railway material, etc., 17,753,662; foods, 14,172,747; coal, coke, oil, etc., 8,569,431.

In the autumn of 1898 statistics were issued showing the extent of the foreign trade for the first six months of that year as compared with the same period in 1897. The value of all the imports with the exception of bullion and specie was \$49,553,375, a decrease of \$150,404 as compared with the first six months of 1897. The exports, exclusive of bullion and specie, during the same period were valued at \$81,632,825, an increase over the first six months of 1897 of \$17,594,290, showing of course a large balance of trade in favor of the Republic. There was a considerable increase in the tariff rates in 1898. By a law passed on September 22 of that year the ad valorem duties of 5 per cent. and under were doubled, and those above 5 per cent. were subject to 10 per cent. additional and 10 per cent. on customs law.

The conditions of the wheat market in the Argentine Republic were unsettled during the spring of 1898. On the outbreak of the war between the United States and Spain a period of depression set in and in the summer of 1898 the wheat market was almost entirely paralyzed.

The steadily growing trade between the Argentine Republic and the United States is shown by the following table taken from the Consular Reports of June, 1898.

Year.	Exports from the United States to Argentina.	Imports into the United States from Argentina.
1892.....	\$2,927,488	\$5,343,798
1893.....	4,979,696	5,239,095
1894.....	4,862,746	3,497,030
1895.....	4,456,163	7,675,270
1896.....	5,979,046	9,313,385
1897.....	6,072,478	10,772,627

See the article SOUTH AMERICA.

Shipping and Communications.—The merchant marine in 1894 consisted of 75 steamers of 21,613 tons net, and 125 sailing vessels with a net tonnage of 28,241. In 1895 there entered 6,496 steamers and 9,878 sailing vessels, having an aggregate tonnage of 6,247,101; the number entering in 1896 was 7,791 steamers and 11,830 sailing vessels, whose aggregate tonnage was 7,115,467.

In 1896 the railway lines open for traffic amounted to 8,998 miles, the capital in gold pesos being in the same year, 510,643,296; the gross receipts, 31,238,326; the expenses, 15,934,466. Some of the lines are owned by the government. The total cost of construction of the lines open in 1894 was 483,508,766 pesos. The total length of telegraph lines in 1896 was 25,345 miles with 59,060 miles of wire and 1,237 offices. The same year the post and telegraph offices amounted to 1,460, and 177,183,190 letters and packages were carried in the mails. The receipts from the postal and telegraph service in 1895 were 30,069,799 pesos, and the expenditure 27,169,020 pesos.

The figures given above setting forth the development of the trade between the United States and Argentina, as well as figures showing an increase in trade with Brazil and Uruguay, have led to a proposal that a new steamship connection be established between the United States and these countries. In 1898 the lines of steamers plying between New York and Buenos Ayres were the Norton Line, the Prince Line, and the Lamport and Holt Company, all of which were British. It is thought that the proposed new American line would effect a saving of ten days in the time required for the voyage under the present conditions. The exports from the United States to Argentine Republic include sack cloth, cotton goods, binding twine, oils, furniture, books, kitchen utensils and various kinds of tools and machinery. From the Argentine Republic the United States receives a variety of animal products, together with flour, cabinet woods, guano, bones, etc. Almost the entire trade is carried on directly between New York and the Argentine ports. It was thought that trade conditions were such as to promise a high rate of profit to an investment of capital in this new steamship enterprise.

Religion and Education.—The State religion is Roman Catholic, but all other faiths are tolerated. For children from six to fourteen years of age, primary education is gratuitous, secular, and compulsory. These schools receive local, state, and federal support. In 1896 the number of primary schools was 2,681 public, 1,034 private, and 34 national, having a total of 8,557 teachers and 264,294 pupils. For secondary education the government maintains 16 lyceums, which have 450 professors and 2,629 students. There are three normal schools, having 1,770 students, and three universities at Buenos Ayres, Cordoba, and La Plata respectively; the universities have

faculties of law, medicine, and engineering, the total number of students being about 300. There are two colleges of agriculture. There are museums at Buenos Ayres and La Plata, and a national university both at the latter city and at Cordoba.

Events of 1898.—Congress opened on May 9, 1898. The President's message declared that the interest on the external debt had been regularly paid and that the internal debt had been considerably reduced. In June Gen. Roca was elected President and Dr. Quirino Costa Vice-President. An important measure in internal administration was the levying of new taxes upon hats, wines, alcohol and oils. The prolonged boundary dispute between Argentina and Chile reached a new stage in the course of the year. The dispute arose out of different interpretations placed upon the treaty of 1881, of which one of the articles declared the boundary line between the Argentine Republic and Chile from north to south as far as the 52d parallel, south latitude, to be the Andes mountains, the line to pass along the highest summits of these mountains and between the watersheds or slopes which lie on each side. It was further provided that, should disputes arise as to the course which the line should take, they were to be decided amicably by experts chosen by the two governments. The Argentines interpreted this article as meaning that the line must lie within the Andes while the Chileans held that it should be traced through the hills and plateaux of Patagonia across the headwaters of the streams that flowed westward. The conflict therefore arose from the fact that the terms of the treaty seemed to be inconsistent and inapplicable to the topographical features of the country, since a line passing between the watersheds would not, in some parts of the region, pass also along the summits of the highest mountains. To the Argentines it seemed essential that there should first be undertaken a survey in order to determine the position of the highest summits, while the Chileans held that the delimitation could be carried on at once, since it required no previous survey to determine the position of the water sheds. An attempt was made to determine the line in the spring of 1892, but the expert named by the Argentine government would not accept the result. In the following spring it was agreed that the survey should be revised. The Argentines declared that the line proposed by the Chileans fell far within Argentine territory. This was now disputed by the Chileans. Another agreement was concluded in the spring of 1896 and several sub-commissions have since been engaged in surveying the country. The portion of the line in dispute in 1898 was that which extended from the 57th parallel to the 40th of south latitude where the mountains branch out east and west; and in one place, if the line passed along their highest summits, the territory of Argentine would be carried as far as the Pacific. The Argentines did not insist upon this extreme interpretation, but at the same time refused to give up the wide tract of territory which would fall to Chile if the latter's understanding of the treaty were accepted. Early in the year Chile had another boundary dispute on her hands with Peru, but so soon as this was settled the Chilean government demanded a prompt adjustment of the dispute with Argentina. Two arbitrators were appointed and negotiations went on during September, when it was decided, upon the report of the arbitrators, to leave the definition of that portion of the boundary which was south of latitude 26°, 52', 45", to the decision of Queen Victoria, in conformity with the terms of the treaty of 1896, while the boundary line to the north of that should be determined in case of disagreement by a representative of the United States as umpire. Late in the autumn President McKinley authorized the American minister to Argentina to sit as the third member of a tribunal of arbitration. It was also agreed to establish a commission composed of five members from each country to report upon the disputed clause of the treaty.

It was reported in 1898 that a German subject had obtained a concession from the Argentine government for the building of a railway system estimated at some 2,000 miles in length. In 1898 the report of the second Princeton geological expedition to the unexplored portion of Patagonia was for the first time made public. This expedition added greatly to the knowledge of the region and brought back many valuable specimens of the fauna as well as interesting collections of arts and manufactures illustrating the degree of civilization attained by the natives of the interior.

ARID LANDS. See IRRIGATION.

ARIZONA, a southern Territory of the United States, with an area of 113,920 sq. m. Capital, Phoenix.

Agriculture.—In his message for the year ending June 30, 1898, Gov. Murphy shows that of the total area of the territory less than one-half per cent. is arable land, and of this part more than one-fourth of a million acres are under canal irrigation. With the cana¹ under construction this area will soon be greatly enlarged. He recommends that all the arid lands be ceded to the territory for local reclamation and occupation. During the year much attention was given to the cultivation of a number of crops new to Arizona, including sugar beets, the canaigre plant for tanning, date palms, melons, cotton, tobacco, and sugar cane. Grazing was par-

ticularly profitable during the year because of the profuse rains. The principal crops were: wheat, 770,532 bushels, value \$708,889, and hay, 116,487 tons, value \$1,397,844. The farm and ranch animals comprised 50,414 horses; 1,041 mules; 18,404 milch cows; 381,812 oxen and other cattle; 1,014,287 sheep; and 23,286 swine—total head, 1,489,244.

Mining.—The territorial geologist reports that of all the metals gold is now the most widely and generally distributed. The gold, silver, and lead mines were worked during the year with gratifying results. Copper showed a larger development than in former years. The production in 1897 was 81,019,922 pounds and in the first six months of 1898, 49,503,294 pounds. Rich veins of manganiferous wolframite have been found at Russellville in the Dragoon mountains; and other rare minerals, such as vanadinite and huebnerite are being worked. At Turquoise mountain, in Mohave county, ancient Aztec workings have been cleared and hundreds of pre-historic stone implements have been found. There are onyx beds of marvelous quality in Yavapai county and the garnets of the Navajo country are highly prized.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise into the districts of Arizona were valued at \$1,752,696, an increase of nearly \$1,000,000, and the exports were valued at \$1,188,301, an increase of \$160,810. The imports of gold and silver amounted in value to \$2,699,626, making the total trade of the year \$5,641,623.

Railways.—In 1898 there were 10 different railroads under operation within the territory, having an aggregate mileage of 1,366, of which the Santa Fé Pacific, with 393 miles, and the Southern Pacific of Arizona, with 383 miles, were the most important. Much new construction was under way, nearly all the roads made extensive improvements, and the general business was very satisfactory.

Banking.—On October 31, 1898, there were 5 national banks in operation, with capital, \$400,000; circulation, \$135,560; deposits, \$1,539,290; and reserve, \$620,240. The territorial banks on June 30, 1898, numbered 7, and had capital \$221,600; deposits, \$1,279,379; and resources \$1,578,907.

Education.—At the close of the school year ending June 30, 1898, there were 18,802 children of school age, of whom 14,613 were enrolled in the public schools. The school districts numbered 244; the teachers 365. The value of public school property was \$472,107, and the expenditures of the year, including \$169,894 for teachers' salaries, were \$221,389.

Finances.—In 1898 the assessed property valuations aggregated \$31,473,359, the largest items being land, railroad property, cattle, city and town lots, and improvements on such lots, and the total showing an increase in a year of \$859,647. The bonded and floating debt on July 1, 1898, was \$997,260; cash on hand \$123,861; net debt \$873,399. A movement was started early in the year to devise means of raising territorial revenues from mines and other industrial sources now untaxed.

Statehood.—The agitation for the admission of the territory into the Union was again temporarily checked by the rejection of the statehood bills of Arizona, New Mexico, and Oklahoma by the House Committee on Territories on January 26, 1898.

Population.—As estimated by Federal officials the population on June 30, 1898, was about 75,000. At the same date the government estimated it at 100,000. There are five Indian agencies in the territory, and Colorado river, Navajo, Hualapai, Prima, and San Carlos, and they contained approximately 40,500 Indians, all living more peaceably than ever before in their history.

History.—An important event was the convention held in Phoenix in January, 1898, consisting of the members of the boards of supervisors of the twelve counties of Arizona, the assessors, the territorial officials and the territorial board of equalization to devise means of raising revenues from mines and other sources. The total assessment of the territory is \$30,000,000, yet the United Verde mine at Jerome is rated worth that sum, and pays taxes in Yavapai county on about \$300,000. On Jan. 25, the Governor called a meeting of the miners of Arizona to form a miners' association. As Arizona has now a population of nearly 100,000 and the citizens are loyal and patriotic, Gov. Murphy recommended in his annual report to the Secretary of the Interior that Arizona should be admitted as a State; that all public lands within the territory be ceded to the territory or State; that the military post, "Whipple Barracks," be re-established; that a sum be apportioned for boring artesian wells; that a commission be appointed for ethnological and archaeological research in the territory, that the salaries of the Federal judges be increased, and also those of the territorial legislature. There was no outbreak of Indians: even the Apache tribes were quiet. The Arizonians were the first to respond to the call for volunteers in Cuba and distinguished themselves for bravery. The President by proclamation (May 10) set apart the Prescott Forest Reserve and prohibited settlement there.

National Representative and State Officers.—The newly elected Delegate to the House of Representatives is J. F. Wilson (Dem.), from Prescott. The Territorial Governor (1899) is N. O. Murphy; Secretary, Charles H. Akers; Treasurer, F. W.

Pemberton; Auditor, G. W. Vickers; Adjutant-General, R. A. Lewis, Attorney-General, C. A. Ainsworth; Superintendent of Education, A. P. Sherman, all of whom are Republicans; Chief Justice of the Supreme Court, Webster Street; Associates, Richard E. Sloan, Fletcher M. Doan, George R. Davis, and Clerk, L. Johnston. These jurists are Republicans. In the territorial legislature there were 22 Democrats and 14 Republicans.

ARKANSAS, a south central State of the United States with a land area of 53,045 sq. m. Capital, Little Rock.

Agriculture.—Official reports for the calendar year 1898 showed a notable increase in the yield of several of the cereals, especially corn, wheat, and oats. The principal crops and values were: corn, 45,365,220 bushels, \$13,155,914; wheat, 2,335,036, \$1,354,321; oats, 7,229,629, \$2,096,592; potatoes, 1,964,922, \$1,080,707; hay, 215,980 tons, \$1,457,865; and rye, 24,077, \$15,650—total value, \$19,161,049. The cotton crop of 1897-8 was 942,267 bales, value, \$27,293,141. The farm animals, Jan. 1, 1899, comprised 234,596 horses; 145,504 mules; 196,808 milch cows; 250,528 oxen and other cattle; 119,733 sheep; and 1,280,120 swine—total head, 2,227,289.

Banking.—On October 31, 1898 there were seven national banks in operation and seven in liquidation. The active capital aggregated \$1,070,000; circulation, \$252,324; deposits \$2,099,492; and reserve \$549,051. The State banks on June 30, 1898, numbered 37, and had capital \$1,502,524; deposits \$3,540,852; and resources \$5,860,326.

Education.—At the close of the school-year 1896-7 there were 460,200 children of school age in the State, of whom 316,270 were enrolled in the public schools, and 195,509 were in daily attendance. The percentage of enrollment by races was, white, 61.75; colored 62.02. There were 5,617 white teachers and 1,564 colored. Public school property exceeded \$1,845,375 in value, and the total expenditures, excluding payments of bonds, were \$1,276,934, of which \$1,090,511 were for teachers' salaries. The public high schools numbered 43, and had 106 teachers and 2,480 pupils, and the private secondary schools 27, with 64 teachers and 1,001 pupils. There were two public and six private normal schools, with a total of 546 students. For higher education there were nine colleges and universities, co-educational and for men only, with 93 professors and instructors and 1,618 students; a college for women exclusively, with nine instructors and 85 students; and a law school, with seven instructors and 37 students. The Arkansas Industrial University at Fayetteville, endowed by Congress, received from the Federal treasury \$22,000 in 1897, and \$23,000 in 1898. In 1898 there were 263 periodicals, of which 25 were dailies, 219 weeklies, and 14 monthlies.

Financial.—The assessed property valuations reached their highest known aggregate since 1860 in 1897, although an estimated valuation in 1890 was the highest on record. The 1897 values were: Real estate, \$117,873,253; personal property, \$59,552,873—total, \$177,426,126; and the State tax rate was \$4.75 per \$1,000. The total recognized debt on October 1, 1896, represented by bonds and overdue interest, amounted to \$4,218,752. The statement for the biennial period ending October 1, 1898 was not available at the time of writing.

Federal Debt Settlement.—The long-disputed debt between the United States and the State was settled in May, 1898. All the bonds and overdue coupons of the State held by the Federal government, excepting 160 that are to be paid in 1900, were turned over to the State and canceled. They amounted at their face value to \$1,476,120, and for them the State paid \$34,172. The amount still due the Federal government is \$160,000. In order to arrange this settlement the State had to surrender its claim to 273,000 acres of land which had been patented by the United States to land grant railroads. Ex-Governor Clarke and Governor Jones objected to this, but Congress insisted; and now Arkansas no longer rests under the stigma of refusing to pay her debts.

Population.—As estimated by Federal officials the population on June 30, 1898, was about 1,390,000.

History.—Arkansas elected a Democratic Governor in Daniel W. Jones. His plurality was 47,838. The Democrats also elected their candidates for Congress by substantial majorities. Their convention declared itself opposed to the issuance of interest-bearing bonds for the purpose of defraying the expenses of the war. The State legislature is Democratic with the exception of two Republicans in the House. The election was the least interesting in many ways since the time of reconstruction. In many places the vote was very light. In Little Rock less than a thousand went to the polls. Early in the year the Interstatehood Partisan Convention in session at Kingfisher adopted resolutions petitioning Congress to pass an enabling act providing for the admission of Oklahoma as a State. Dennis Flynn (Rep.), from Guthrie, was chosen to represent Oklahoma in the House of Representatives. On March 8, 1898, Congress permitted Arkansas to devote the proceeds arising from the sale of section numbered sixteen in every township to common school purposes.

National Representatives and State Officers.—The Representatives from Arkansas are all Democrats: Philip D. McCulloch, John S. Little, Thomas C. McRae, William L. Terry, Hugh A. Dinsmore, and S. Brundige, Jr. The Senators are James H. Berry, from Bentonville, and James K. Jones, from Washington, both Democrats. The officers of the State are: Daniel W. Jones, Governor; Alex. C. Hull, Secretary; Thomas E. Little, Treasurer; Clay Sloan, Auditor; Jefferson Davis, Attorney-General; J. J. Doyne, Superintendent of Education; Frank Hill, Commissioner of Agriculture; and J. W. Colquitt, Land Commissioner. Chief Justice of the Supreme Court, Henry G. Bunn; Associates, Simon P. Hughes, C. D. Wood, B. B. Battle, and James E. Riddick; and Clerk, P. D. English. In the State legislature there are 130 Democrats and 2 Republicans.

ARMENIA. Armenia and Kurdistan form a part of the Turkish empire. Armenia comprises the three vilayets of Erzerum, Diabekr, and Mamouret ul Aziz, together with the districts of Van and Bitlis, with a total area of 72,491 square miles, and an estimated population of 2,472,400. The estimates, however, are various and the figures showing the area and population can not be relied upon. Some place the area as high as 90,000 square miles and the population as high as 5,000,000. In latter years large numbers of the Armenians have emigrated owing to the massacres and have scattered themselves throughout the cities of Russia and in still more distant countries. For an account of recent aspects of the Armenian question see the article TURKEY.

ARMENIANS. There are 8,436 Armenians scattered throughout the United States. They consist chiefly of single men, who have fled to this country to escape from the Turkish rule, to earn their living. Many of them are employed in the silk-mills of New Jersey; hundreds are merchants, weavers, and repairers of oriental rugs; others are small shop-keepers, those in New England are laborers, and those in California and Texas engage in agriculture. There are also a number of lawyers, ministers, and doctors (fifteen Armenian physicians practise in New York City). Worcester, Mass., is their centre: other communities exist in Fresno, Cal., and Paterson, Texas. There are 1500 in New York City; 500 in West Hoboken; 800 in Worcester; 300 in Chicago and vicinity, and 400 in Fresno, Cal. There are two sects: the Gregorians, members of the old Armenian church; and Evangelicals, those connected with the Protestant communities of Turkey. The Gregorians hold services in New York, Worcester, Providence, and Cambridge, with the Right Rev. J. Larajian as their bishop and general pastor. They have about ten libraries and free lecture societies for the education of their young men, and in 1898 they collected \$8,500 for religious and charitable work. The Evangelicals have a church in Worcester, with 25 members, and also hold services in about twelve other cities.

ARMIES. See the articles on the separate countries.

ARMY AND NAVY UNION, organized in Cincinnati, in 1888, has now 170 garrisons with an estimated membership of 12,000, consisting of men who have served in the army, navy, and marine corps of the U. S. and received honorable discharges. The branches are called garrisons and are situated at military posts, on board war-ships, or at naval barracks. A circular issued since the Spanish-American War invites all honorably discharged men from any branch of the regular service, and all who took part in the campaigns against Spain, on land or sea, to join this Union for the following purposes: "To provide for our comrades and shipmates when sick or in distress, to bury our dead and extend a helping hand to the dependents of our departed, and to secure from Congress and other legislative bodies the enactment of laws beneficial to our comrades and shipmates." National commander, Henry Shindler, Leavenworth, Kansas.

ART. See MUSIC, PAINTING, SCULPTURE and ARCHÆOLOGY.

ARTESIAN WATERS. The several important artesian basins of the western States have for some time been under investigation by the United States Geological Survey, and during the year 1898 this work has been continued especially in Nebraska, and North and South Dakota. The points considered are, detailed information as to the location of water-bearing beds, extent of basin, and limits of territory in which artesian flow may be expected, and the prospects for a continued water supply.

In southeastern Nebraska, agriculture is not entirely dependent upon irrigation, but is greatly benefited by it. This region lies on the eastern slope of the great plains, and the underground waters, which are available, occur in several different horizons, one series of water-bearing sands occurring under the lowest and over the Pierre Shales. The other series of water-bearing beds are in the Dakota sandstone, but most of the wells occur in the former. In South Dakota the South Dakota sandstone carries a large volume of excellent water under high pressure, which is available over a wide area, in the eastern part of the State, and into depressions of the val-

ley of the Missouri river, and confluent valleys. The head is along the foot hills of the Black Hills and the Rocky Mountains, the pressure and head diminishing to the southeast, and in the extreme corner of the State there is no flow. The same conditions occur in northeastern Nebraska, and probably in central Nebraska, especially on the lower plains.

A curious increase of underground temperature at the depth of the wells mostly from 500 to 1500 ft. is shown by the temperature of their water. Thus the downward increase of heat at Fort Randalo is one degree F. for each 17½ ft., and the whole artesian district has a range from about 20 to 45 ft. for each degree in contrast with an average elsewhere of about 50 ft. for a degree. The causes of this exceptional condition in a region so far from any recent volcanic action and undisturbed by organic processes are not yet ascertained. See IRRIGATION.

ART STUDENTS' LEAGUE, established in 1875 by the art students of New York for the purpose of giving academic instruction in drawing, painting, modelling, and composition. The board of control consists of twelve members. President, Edwin C. Taylor, Corresponding Secretary, Alma de Mier. Prizes and scholarships are offered.

ASBESTOS. The production of this mineral in 1898, was 18,000 tons. No new mines were opened, and the American output came entirely from Georgia.

ASIA, FLORA OF. See BOTANY (paragraph Systematic Botany—Asia).

ASIATIC ASSOCIATION, formed in New York, June 16, 1898, to foster and safeguard the trade and commercial interests of the citizens of the United States and others associated therewith in the empires of China, Japan, and Corea, and elsewhere in Asia or Oceanica. President, Everett Frazer; Vice-President, Samuel Brewster; Secretary, John Foord (P. O. Box 1500, New York). Membership 130.

ASIATIC SOCIETY OF BENGAL, founded in 1784, consists of ordinary, associate, corresponding and honorary members. The society owns a fine Museum and has a library rich with valuable MSS. It publishes the series *Bibliotheca Indica*.

ASPHALT. See PAVEMENTS, PIPE LINES AND RESERVOIRS.

ASPHALTUM. This term includes the nearly liquid form known as maltha or brea, bituminous limestone and sandstones, and hard asphaltum which is known under various names such as albertite, elaterite, gilsonite, wurtzelite, lithocarbon, etc.

The production since 1890 has been:

Year.	Short tons.	Value.
1890.....	40,841	\$190,416
1891.....	45,054	242,264
1892.....	87,680	445,375
1893.....	47,779	372,232
1894.....	60,570	353,400
1895.....	68,163	348,281
1896.....	80,503	577,563
1897.....	75,945	664,632

California supplies both the liquid and hard asphaltum; Kentucky the bituminous sandstone; Indian Territory, bituminous limestone and sandstone; and Colorado and Utah, hard asphaltum known as gilsonite or uintahite. The imports of asphaltum in 1897 were 115,528 long tons valued at \$392,770 and came chiefly from Trinidad, but in lesser amounts from Mexico, Cuba and Europe.

ASSEMBLY, GENERAL. The officers elected at the last General Assembly of the Presbyterian Church in America were: Rev. Wallace Radcliffe, Washington, D. C., Moderator, and W. H. Roberts, Stated Clerk. President, George Tuakin, Philadelphia; Treasurer, F. K. Hipple, Philadelphia; and Cor. Secretary, Rev. Joseph Beggs, Schuylkill, Pa.

The officers elected at the last General Assembly of the Presbyterian Church in the U. S. (South) were: Rev. E. M. Green, Danville, Ky., Moderator; Rev. W. A. Alexander, Stated Clerk; and Robert P. Farris, St. Louis, Permanent Clerk. President, E. N. Hutchinson, Charlotte, N. C.; Vice-President, T. B. Shearer, Davidson, N. C.; Secretary and Treasurer, John E. Oates, Charlotte, N. C.

ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, AMERICAN, organized in 1840, has 1,812 members. President, Wolcott Gibbs, Newport; Secretary, F. W. Putnam, Cambridge, Mass.; Treasurer, R. S. Woodward, New York. See ZOOLOGICAL SOCIETIES (paragraph American Association), and BOTANY (paragraph Botanical Societies).

ASSOCIATION FOR THE STUDY AND CURE OF INEBRIATES, AMERICAN, organized in 1870. Membership consists of superintendents and physicians of

inebriate asylums and others interested in studying inebriety as a disease. Last annual meeting was held in New York City, October 20, 1898. President, L. D. Mason, M. D., Brooklyn, N. Y.; Secretary, T. D. Crothers, M. D., Hartford, Conn.

ASSOCIATION OF AMERICAN ANATOMISTS, organized September 17, 1888; meets annually in December. President, B. G. Wilder, M. D., Ithaca, N. Y.; Secretary, D. S. Lamb, M. D., 800 10th st., N. W., Washington, D. C.

ASSOCIATION OF AMERICAN MEDICAL COLLEGES, organized at Nashville, Tenn., May 21, 1890, for the full consideration of medical education in this country and measures for its improvement. Next annual meeting at Columbus, O., in June, 1899. President, H. O. Walker, M. D.; Secretary, Bayard Holmes, M. D., 103 State st., Chicago, Ill.

ASSOCIATION OF AMERICAN PHYSICIANS, organized in Washington, D. C., in 1886, for the advancement of scientific and practical medicine. Next annual meeting in Washington, D. C., in May 1899. President, G. Baumgarten, M. D., St. Louis, Mo.; Secretary, Henry Hun, M. D., 149 Washington ave., Albany, N. Y.

ASSOCIATION OF ASSISTANT PHYSICIANS OF HOSPITALS FOR THE INSANE, organized in 1895. Last annual meeting at Mendota, Wis., in October 1898. President, Geo. A. Post, M. D.; Secretary, Irwin H. Heff, M. D., Pontiac, Mich.

ASSOCIATION OF GENITO-URINARY SURGEONS, AMERICAN, organized in New York, October 16, to promote the study of genito-urinary and venereal diseases. The next annual meeting at Niagara Falls, N. Y., May 1899. President, James Bell, M. D., Montreal, P. Q.; Secretary, Wm. K. Otis, M. D., 5 W. 50th st., New York City.

ASSOCIATION OF LIFE INSURANCE MEDICAL DIRECTORS OF AMERICA, organized May, 1889, with the object of promoting medical science as applied to life insurance. Last annual meeting at Montreal, P. Q., Canada. President, H. C. Tabb, M. D., Richmond, Va.; Secretary, O. H. Rogers, M. D., 346 Broadway, New York City.

ASSOCIATION OF MEDICAL OFFICERS OF AMERICAN INSTITUTIONS FOR IDIOTIC AND FEEBLE-MINDED PERSONS, publishes an official organ, the *Journal of Psycho-Asthenics*, at Faribault, Minn. President, Mary A. Dunlap, M. D., Vineland, N. J.; Secretary, A. C. Rogers, M. D., Faribault, Minn.

ASSOCIATION OF MILITARY SURGEONS OF THE U. S., organized in 1891. President, J. D. Griffith, M. D., Kansas City, Mo.; Secretary, James E. Pilcher, M. D., Major U. S. A.

ASSOCIATION OF OBSTETRICIANS AND GYNÆCOLOGISTS, AMERICAN, organized in 1888, for the promotion of knowledge of abdominal surgery, obstetrics, and gynæcology. Next annual meeting at Indianapolis, Ind., the time being left to the executive council. President, Edward J. Ill, M. D.; Secretary, Wm. W. Potter, M. D., Buffalo, N. Y.

ASSOCIATION OF PHYSICIANS AND SURGEONS, AMERICAN, organized at Indianapolis, Ind., in October, 1894. Delegates are appointed by State societies of any school of medicine. Any physician may become a member. President, Wm. D. Gentry, M. D., Chicago, Ill.; Secretary, R. C. Kelsey, M. D., 211 Ohio st., Indianapolis, Ind.

ASTERIODS. See ASTRONOMICAL PROGRESS.

ASTOR LIBRARY. See NEW YORK PUBLIC LIBRARY.

ASTRONOMICAL PROGRESS DURING THE YEAR 1898. In the following pages we have given a very brief account of the advances made in the more important departments of astronomy. Technical details have been avoided as much as possible, but references have been added that will enable the reader who may desire more complete information to follow out the details of the various investigations.

The *Solar Parallax* has been the subject of very extensive researches during recent years, and these have been almost completely published in 1898. It is unnecessary here to refer to the scientific importance of an extremely precise determination of this quantity, beyond reminding the reader that measuring the solar parallax is really only another term for measuring the distance from the earth to the sun. This is the fundamental unit of distances in astronomy. Upon it depend directly all our notions as to the magnitude or extension of the solar system, and indeed of the universe in general. But the solar parallax problem is not only the most important one in fundamental astronomy: it is also perhaps the one offering the greatest difficulty in solution. Astronomical instruments enable us to submit to actual measurement only the directions in space of the heavenly bodies, never their distances. These latter must be obtained by computation from measured directions or angles, and for this purpose some base-line is indispensable. The largest possible terrestrial

base-line is of course a complete diameter of the earth. Yet so small is even this compared with the distance of the sun, that it would subtend an angle of only about eighteen seconds of arc to an imaginary observer at the sun's centre. When we reflect that an angle of one second corresponds to only three-tenths of an inch at a distance of one mile, we get some idea of the extreme minuteness of the earth's diameter as seen from the sun.

It is never possible, of course, to get a complete diameter of the earth for a base-line; but extraordinary efforts have been made to come as near as possible to satisfying this ideal condition. For many years observations of transits of Venus were considered the most favorable means of measuring the small angular differences of direction of the sun's centre as seen from opposite sides of the earth. No expense was spared, especially for the transits of 1874 and 1882, to secure very complete observations. Yet although the various civilized governments of the world sent out numerous and most elaborately equipped observing expeditions, the whole operation turned out practically a failure. It was simply impossible by this method to secure observations of the requisite precision. Of late years, two other methods have been pretty generally agreed upon as the best. The first is based upon the so-called constant of the aberration of light. It is known that the directions in which we see the stars are apparently thrown forwards towards that point on the sky to which the orbital motion of the earth is carrying the observer. It is a phenomenon analogous to the well-known fact that if a man be running in a rain-storm the falling-drops *seem* to slant towards him though they may really be falling vertically. So their direction seems to be thrown forward in the direction of the observer's motion. In the case of the earth's orbital motion around the sun, the observer will be moving in opposite directions in space at intervals of half a year. Consequently the effect of aberration is reversed, and the so-called "constant" or amount of aberration admits of determination from the differences of observations made six months apart. Without entering into technical details, it will suffice here to say that the solar parallax can be computed from the aberration constant, provided only that we know the velocity in miles per second of the transmission of light in space. This is fortunately known with quite sufficient precision from the recent researches of Newcomb and Michelson.

The other accredited method of determining the parallax is by observations of the planetoids. The method is extremely simple in practice, and also very accurate. It is necessary merely to await a time when one of these little bodies is favorably situated for observation, and then to fix its position telescopically with respect to the neighboring small stars. Let this be done simultaneously at two observatories situated very far apart on the earth, and using, of course, the identical small stars in both places. Then it is clear that the position determined for the planet will not be quite the same at the two observatories. It is like fixing the position of a distant point in an ordinary survey, only that here the base-line is the entire length of the straight line joining the two observatories. As a result we obtain directly the distance of the planet from the earth, in terms of this base-line as a unit. But this is known in miles from existing geodetic surveys of the earth. Thus we arrive at a knowledge, in miles, of the planet's distance. But from the ordinary processes of astronomical observation, we know the so-called elements of the planetoid's orbit. We can find from these by a simple computation based on Kepler's laws, the distance of the planetoid from the earth in terms of the latter's distance from the sun. Knowing then the distance between the earth and planetoid in miles from the special parallax observations, and in terms of the distance "earth-sun" from theory, we can at once deduce the value of "earth-sun" in miles. This, combined with our knowledge from geodesy of the terrestrial radius in miles, enables us to compute the angle subtended by that radius to an observer in the sun,—in other words, the solar parallax.

Now these two very precise methods of determining the parallax are of peculiar interest in the present year, because, as we have already said, the result of elaborate practical applications of both methods have just been published. The planetoid method has been put in operation by no less than twenty-five observatories, acting in coöperation. By thus increasing the number of observation stations the precision of the final result cannot fail to be greatly enhanced. The entire "campaign" was planned and managed by Dr. David Gill, of the Cape of Good Hope observatory. The observatories taking a principal part in the work, in addition to that at the Cape of Good Hope, were those at Bamberg, Leipzig, Göttingen, and, in this country, Yale University, at New Haven. All these observatories are provided with the modern heliometer, the most precise apparatus for measurement on the sky at present known to science. These instruments were all constructed by Repsold, of Hamburg, to whose skill as a mechanic the success of the whole undertaking is largely due.

The parallax determinations through the constant of aberration have been made principally in connection with the study of latitude variation, to which we shall

have occasion to refer again below. But it will be of interest here to show the relative importance or "weight," of the various parallax methods. The latest general work of high authority on the *Fundamental Constants of Astronomy* is by Simon Newcomb, and was published at Washington as recently as 1895. Professor Newcomb assigned the following "weights," or relative degrees of precision:

From the aberration constant.....	weight 68
From the planetoid method.....	weight 20
Six other methods combined.....	weight 35

Newcomb was already at that time in possession of preliminary results of Gill's researches, communicated to him in advance of publication. But since his writing, several important series of aberration determinations have been made public, and the results exhibit certain small discordances among themselves, which will probably tend to discredit somewhat the aberration method, and consequently to enhance the relative weight of the planetoid method. We shall see further on also that the latter method will probably gain greatly from the discovery, quite recently, of a new planetoid, much more favorably situated for parallax determinations than any previously known.

The final result for the solar parallax at present accepted by astronomers in general is 8".80, corresponding to a distance of 92,789,000 miles between the earth and the sun.

Measurement of the Apparent Shape of the Sky.—Among the minor, but interesting, researches of the year is one by Deichmüller of Bonn, having for its rather remarkable object the direct measurement of the apparent vault of the heavens. If this be found to differ at all from a hollow half-sphere, it must be the result of some form of optical illusion. Now it has long been known that the moon appears much larger when near the horizon than it does high up in the sky. This must of course be due to an analogous optical illusion. The common explanation is that when the moon is low down in the sky, the observer has a better opportunity to compare it with surrounding trees, houses, or other terrestrial objects. This explanation is, however, quite insufficient. Deichmüller tried the following plan with great success. A terrestrial point easily visible at night was selected, such as a light in the top of a steeple. The observer then simply placed himself in such a position on the ground that some bright star seemed to him to be vertically over the steeple. This could be accomplished easily by walking towards or away from the steeple. The star would then seem to travel along also in the direction of the steeple or away from it, and would finally seem to be just over it. The exact time was then noted, and the distance of the observer from the foot of the steeple measured. A simple calculation from the time of the observation gave the angular altitude above the horizon of the star at the instant of observation. Using the distance to the steeple as the base of a right-angled triangle, and the angular altitude of the star as the base angle, it was easy to compute the long side trigonometrically. This would then be the apparent distance of the star in linear measure. And since the star is set at a certain point on the vault of the sky apparently, we have also the distance of one point of that vault. Thus a series of apparent *radii* of the sky were obtained, corresponding to all sorts of angular altitudes. The results were surprisingly accordant among themselves, showing the method of observation to be capable of considerable precision. They brought out the interesting fact that the apparent shape of the sky is not spherical, but that it is considerably flattened at the top. In other words, the sky *seems* much further away from us near the horizon than in the zenith directly overhead. And this is the reason why the moon appears big in the horizon. For with a constant angular magnitude, it would of course appear biggest when projected on the "most distant" part of the sky.

This investigation of Deichmüller's is important for other reasons in addition to the great interest that attaches to the study of all forms of optical illusion. It is evident that quite a series of celestial observations will be influenced by any difference that may exist in our estimation of size and form in different parts of the sky. Thus an effect would be seen in observations of meteor paths, shape of comet's tails, aurora observations, and especially observations of the zodiacal light.

Astro-photography.—In no department of astronomy has development in recent years been so marked as in the application of photographic processes of observation. Indeed, it is not too much to say that they are beginning more and more to enter into very active competition with direct eye observing. Now the use of photography can be considered from two points of view. Of course it was to be expected that the sensitive plate would be tried in the telescope just as soon as photography itself became a matter of common knowledge among scientific men. So the use of the plate for the simple pictorial purposes of so-called descriptive astronomy could not fail to become very general. In short, the photograph is admirably adapted for find-

ing out what the heavenly bodies look like, and to fix their outlines, form, etc. But that the plate should also come to occupy a most prominent position in the astronomy of precise measurement was indeed not to be expected, or at all events, not immediately. And, if photography had accomplished nothing more than what it has done for descriptive astronomy, we should nevertheless rank it among the most powerful weapons in the armory of the astronomer. It is but necessary, for instance, to examine a series of eye and hand drawings of some total solar eclipse, executed by different skilled observers at the same time, to come at once to the conclusion that it is well-nigh impossible to obtain correct information in this way. The very outlines of the corona and prominences will sometimes differ so greatly that one would hardly believe an attempt had been made to delineate the same object. So fallible are the senses and the powers of execution of even the most highly trained observers. But let the photographic plate be submitted for the eye and hand of man. All is then changed. We obtain a faithful picture, drawn by Nature's own pencil, something exact to leave to future generations of investigators, who will perhaps succeed in solving some of the problems for which we now lack the essential observational material.

But it is to photography in exact astronomy that we would direct particular attention. It has been mentioned already, under *Solar Parallax*, that the heliometer, as we call it, is the most exact instrument we know of for executing measurements on the sky. Yet we must qualify that statement here, for the photographic plate, combined with subsequent measurement under the compound microscope, is beginning to claim very nearly an equal place. No one can say which will stand first a generation hence. It is difficult to fix the date when photography may be said to have first asserted itself in exact astronomy. But perhaps the year 1892 saw the first publication of an extensive series of photographic results of the highest precision. These were derived from excellent photographs of the cluster *Pleiades*, made in 1872 and 1873 by Rutherford in New York. Scheiner, of Berlin, calls this publication of 1892 the first in which the equality of the photographic results with those of the heliometer may be said to have been conclusively demonstrated. It has been followed in the last few years by numerous other series of star-cluster measures, so that we may say an extensive mass of material is being gathered by photography, material of the highest precision, and of the last importance in stellar astronomy. For it is only by a study of the minute inter-stellar motions in the star-clusters that we may hope, within the limits of human time, to throw some light upon the problems of motion within the greater universe that lies beyond our own solar system. Such are in truth the vast cosmic problems that expand and ennoble men's minds,—such the problems that have won for astronomy her title, "queen of the sciences." It is to photography that we must look for our observational material. For while the heliometer can doubtless give us equal or superior precision, it involves so much more labor in actual use as to render hopeless the possibility of doing more with it than merely touching the surface of the problem. Science demands generalizations, and these can be secured only by the discussion of very large masses of observations.

Stellar Parallax by Photography.—The study of stellar parallax has likewise received a quickening impulse from the introduction of photographic processes. We have explained under *Solar Parallax* that our distance from a heavenly body can be measured by using as a base-line the distance between two widely separated observatories on the earth. Of course the stellar distances are so excessively great as compared with distances upon the earth, that this same method cannot be utilized. The entire terrestrial diameter shrinks into absolute insignificance when compared with the space dividing us from our very nearest neighbor among the fixed stars. But we can fortunately in this case have recourse to a larger base-line. We can make use of the diameter of the earth's orbit around the sun. In other words, we can observe the slight displacement in direction of a fixed star when observed at intervals of half a year from opposite sides of the earth's orbit. Very few stars have been found near enough to us to exhibit a measurable displacement, even with so large a base-line as the one mentioned. But there can be no doubt that the enlarged observational facilities afforded by photography will before many years add not a few to the small list of known stellar parallaxes.

Meridian Photography.—Even the ordinary meridian instrument may have to yield to the sensitive plate. The so-called Transit Instrument is used for noting the instant of a star's passage (or "transit") across the meridian of the observatory. An attempt has been made to substitute photography for the eye in the use of such instruments. The only difficulty encountered seems to be a lack of sufficiently sensitive plates, so that observation has been perforce limited to stars of quite considerable brilliancy. But measures are now being taken to meet this trouble, and we may hope to announce complete success in transit photography in an approaching edition of this work.

We shall here only call attention in passing to the immense advances made in the

discovery of planetoids since the introduction of photography. The reader is referred to the paragraph Planetoids in the present article for a brief account of these amazing discoveries culminating in the interesting planet D Q, now known to be our nearest permanent neighbor in space, with the single exception of our moon.

A number of comets have also been discovered by photography, and reference is made to some of them under the heading of Comets, in a succeeding paragraph. It has been found that the photographic methods not only permit the discovery of these objects, but also furnish a means of determining their positions and orbits with greater facility and precision than could be attained by the older methods.

The Cape Photographic Durchmusterung, and the Astro-photographic Catalogue of the Heavens.—Decidedly the most complete triumph of photography in astronomy has been accomplished by the partial publication this year of Gill and Kapteyn's Cape of Good Hope Photographic Durchmusterung. The following is a brief account of this great undertaking. In the year 1882 a very bright comet appeared in the sky, and was especially conspicuous in the southern hemisphere. It was so bright that the idea occurred to Gill at the Cape of Good Hope observatory that it might actually be possible to photograph it. Having no special photographic apparatus, he called to his aid a neighboring portrait photographer named Allis. An ordinary portrait camera was employed by them, and for convenience in mounting it was simply strapped to the tube of an ordinary visual telescope in the observatory. With this apparatus they obtained what is believed to be in all probability the earliest successful comet photograph. In examining the resulting negative, Gill's attention was especially attracted to the extraordinarily large number of stars appearing on the plate as minute points or dots. Of course stellar photographs had been made successfully long before that time by Rutherford and others, but it was from the comet photograph of 1882 that Gill first got the inspiration that has led to an enterprise destined to figure as the crowning work of the nineteenth century in astronomical science. This is the astro-photographic catalogue and chart of the heavens, which, however, only came to be undertaken after the *Durchmusterung* was well under way. This term is German, but it has been naturalized in scientific English. It was first used to describe Argelander's great catalogue of stars in the northern half of the sky. Argelander conceived the idea that it would be very desirable to have an enumeration or census of *all* the stars in the sky, down to a given magnitude. His plan was to make it complete as to numbers, even if it should be impossible to give more than a rough approximation to the positions of the stars on the sky. Time has abundantly proved the correctness of Argelander's ideas. Other star-catalogues have arrived at high precision, but have been limited necessarily to a comparatively small number of stars. Human powers of endurance are insufficient to apply the more delicate processes of very exact observation to numbers of stars running into the hundreds of thousands. Exact catalogues have their uses; and are indeed the most important of all. Yet Argelander's idea of completeness as to numbers at some sacrifice of precision has rendered possible many statistical and other researches of far-reaching importance in stellar astronomy. But Argelander and his successor Schönfeld, observing at Bonn in Germany, were able to carry their survey of the heavens only a short way beyond the northern half. Gill, in his observatory at the Cape of Good Hope, far south of the equator, saw the possibility of extending Argelander's work to the south pole by means of photography. To have so extended it by the visual methods that were used by Argelander would have required a greater expenditure of time and labor than could have been spared from other and more pressing work. But a small photographic telescope was procured, and in the hands of a scientific photographer who was summoned from England (C. Ray Woods) a complete collection of plates of the southern sky was made. Gill found in Kapteyn of Gröningen, Holland, an efficient collaborator. The negatives were sent to Gröningen, and were there measured by Kapteyn. The resulting catalogue will fill three large quarto volumes, two of which have been published by the British government. It was found that the catalogue possesses greater completeness even than Argelander's. For the fallible human eye cannot avoid omitting a star now and then, while the photographic plate of course is never subject to any such error.

But the *Durchmusterung*, as we have said, is not to be the only result of Gill's 1882 comet photograph. It seemed to him that it might also be possible to attempt a new star-catalogue which should satisfy the condition of high precision as well as that of completeness as to numbers, provided the coöperation of many observatories could be secured. So vast an undertaking can be rendered possible only by the combined efforts of many astronomers and many observatories. As the result of preliminary correspondence, a meeting to consider the subject was called at Paris by the French government in 1887. Delegates from all the civilized nations attended. It was decided that the proposed photographic catalogue of precision should really be made, so that it might stand for all time as the foundation of future research

in sidereal astronomy—truly a fitting legacy to those who shall follow this closing 19th century. No less than eighteen observatories are taking a part in this work, and at the present time most of the plates for the great catalogue have been made. In some of the participating observatories the measurement of the plates has also been commenced. We may then hope to chronicle the appearance of the first installment of this greatest of catalogues at no very distant date. For the present we shall content ourselves with merely calling attention to the general principles of the work, which undoubtedly constitutes the most elaborate astronomical operation the world has yet seen. All the plates for the catalogue are being made in duplicate, so that the whole face of the sky will be covered twice. No less than 44,108 plates will be necessary for this, and each includes a surface of four square degrees. It is hoped by this duplication to make error of any kind practically impossible. All stars down to the eleventh magnitude are to be included in the catalogue, and the total number will probably not fall short of two millions.

For the myriad stars of still lower brilliancy a further series of plates has been projected, and these are also being made. It is not, however, intended to subject these to exact measurement. Such would involve an amount of labor surpassing the possibilities even of elaborate governmental coöperation. They will be simply reproduced photographically in charts for distribution to astronomers who may need them in their special researches.

With this very brief account we are compelled to dismiss the important subject of Astro-photography, referring the reader who may wish more detailed information to the following publications: *Bulletin du Comité Permanent de la Carte du Ciel*, Paris, Institut de France, Tomes I and II. Scheiner's *Photographie der Gestirne*, Leipzig, 1898.

Astro-physics.—This department of the science of astronomy will be treated under Physics (q. v.).

New Star Near Vega.—This was one of the first discoveries made by Barnard with the great Yerkes telescope. It is rather odd that it should have escaped notice hitherto, since a great amount of attention has always been given to the bright star Vega.

The Harvard Conference of Astronomers and Astro-Physicists, and the American Astronomical Society.—It will be remembered that when the great Yerkes observatory of the University of Chicago was formally opened in August, 1897, a large number of prominent astronomers and astro-physicists were invited to come to Chicago and take part in the opening exercises. These exercises were to include a series of conferences, at which the visiting scientific men were to present papers involving the results of their recent researches. It turned out that a very large number of distinguished men accepted the invitation of the Chicago authorities, and as a result these conferences became the most interesting of the various functions connected with the opening ceremonies of the new observatory. In fact, they seemed so important to the attending astronomers, that it was decided to give a certain permanence to the idea of astronomical conferences, by holding them once every year. Accordingly, an invitation was sent out by the observatory of Harvard University, asking astronomers and astro-physicists to assemble there in August 1898, for the presentation and discussion of scientific papers. No less than ninety-two persons responded by personal attendance at the Harvard conferences, and a number of others who were prevented from attending showed their interest by sending researches in manuscript which were read to the conference and discussed. It is impossible here to enter into a description of the many interesting papers presented. But the most important action consisted in the selection of a strong committee to consider the establishment of a formal American astronomical society. The committee consists of Professors Pickering, Hale, Comstock, Newcomb and Morley. It reported to the conference a general plan of formation for the society, and was continued as a council to perfect the organization. That the United States will at last have a permanent astronomical society has therefore now gone beyond the stage of mere probability. There can be no doubt that such a society is a great desideratum. Entirely apart from the entertainment and instruction obtained by the members at the annual meetings, such societies have a function of great importance to the progress of science. This consists in the prompt publication of scientific memoirs. It is true that many channels for such publication already exist. But a well-managed and influential society, having a strong editorial committee of specialists in charge of its publications, has been found to furnish the most effective method of bringing new work before the special public to which it will prove of interest.

The Double Star 61 Cygni.—Perhaps the entire sidereal heavens contain no case of greater present interest than this famous object. Composed of two separate stars of nearly equal brightness, and separated on the sky by only about seventeen seconds of arc, it has always been easily observable even in the smallest telescope. It has received particular attention on account of the two component stars having nearly the same "proper motion," both in amount and direction. In other words,

they are moving across the sky at very nearly the same apparent rate of speed, and with almost exactly the same objective point for their motion. This in itself would not be so very remarkable, were it not for the added peculiarity that the rate of motion of the two stars is among the largest known anywhere in the heavens, being no less than about five seconds of arc each year. That two stars should happen, by the mere effect of chance juxtaposition, to be so near each other on the sky, and should present such exceptionally peculiar similarity of motion, would seem too improbable to be considered for a moment. In fact, from an examination of the probabilities of the case, astronomers have long since concluded that the two component stars of 61 Cygni are no chance companions, but form integral parts of one and the same sidereal system. There has always been, however, one difficulty in the way of this explanation. If the stars really belong together, they are not simply *apparent* neighbors projected on the distant vault of the sky, and really separated by the profound depths of space. They must then be a true binary system, and it is but fair to expect them to exhibit the effects of gravitational attraction. In other words, we should find one of the stars revolving about the other, or at all events, both should have a revolution about their common centre of gravity. But in spite of all efforts to determine the elements of such supposed orbital motion, astronomers have not yet succeeded in proving its existence beyond a reasonable doubt. If, then, we have in 61 Cygni a real binary system, it must be built upon so vast a cosmic scale that the time limits of human observation have not yet sufficed to reveal the orbital motion. In addition to the above peculiarities of 61 Cygni, it possesses still one other distinction, which alone would put it in the front rank of astronomical importance. It is the first fixed star whose distance from the earth was ever measured. The great difficulty of all such measures of stellar distance has already been mentioned under STELLAR PARALLAX and ASTRO-PHOTOGRAPHY. Cygnus was the first constellation to yield a limit in space to the sounding-plummet of the astronomer. Bessel, the famous director of the Königsberg observatory, was the man who first succeeded in demonstrating the possibility of measuring stellar parallax; and the star which gave him the first successful result was 61 Cygni.

After this brief account of the scientific history of this star, we now proceed to explain why it has again come into special prominence this year. Of course the first parallax determination by Bessel was followed by other investigators, who sought to verify or disprove his result by attempting observation of the same star. The photographic process has also been applied to it by several astronomers, and notably by Wilsing, of Potsdam, whose results have only been published quite recently. Wilsing was able to verify Bessel's parallax pretty nearly. But he detected an entirely new and mysterious peculiarity in this star of many peculiarities. He discovered that the distance on the sky between the two components did not stay constant. It would appear that there is a pendulum-like swinging of the one component backwards and forwards in the direction of the other. The whole swing is rapid, as time is counted in sidereal astronomy. For only nineteen months are required to complete an excursion of the moving component back and forth. Wilsing was able to offer only one explanation of his discovery. He thought one of the components must be itself a close double, in which the companion star is large but non-luminous. Thus we see only the one star, but we can imagine it in rapid rotation about the larger dark star. This rotation might indeed carry it alternately nearer to and further from the other visible component. But the whole matter is still *sub judice*, awaiting verification by other observers.

As if we did not already have enough to puzzle us in this star, the old question as to whether the two visible components are really physically connected has been re-opened this year. Davis, of New York, has published a new discussion of Wilsing's observations, and comes to the conclusion that the major part of the discordances observed by him could be explained if we assume a difference in parallax for the two stars. That is, if we are willing to abandon the accepted hypothesis that the visible components belong together, and take them to be really very widely separated in space, we can get another fairly plausible explanation of Wilsing's results. Moreover, Davis has collated and compared all the numerous existing parallax determinations of the two components. He has also re-determined the parallax, using previously unpublished photographic observations by Rutherford, and he finds on the whole that the parallaxes differ quite materially for the two components, and concludes that our old theory is wrong. He considers that the two stars are probably not physically connected at all, and falls back on the old hypothesis of chance juxtaposition to account for their nearness and similarity of motion. On the whole, we may say that Davis has made out a pretty good case, considering the delicacy of the inquiry. But we doubt very much whether any of the parallax observations are of sufficient precision to make it altogether safe to rely very greatly on their evidence in the present case. The most we can do is to recognize the great interest attaching to the question now re-opened by Davis, and to hope that some further precise series of parallax observations will be undertaken soon.

Concerning 61 Cygni, see Davis, *Popular Astronomy*, Vol. VI. p. 487, and *Contributions from the Observatory of Columbia University*, No. 13; Bessel, *Astronomische Nachrichten*, Nos. 365-6; Wilsing, *Publicationen des Astrophysikalischen Observatoriums zu Potsdam*, No. 36.

Meteors.—A particularly magnificent display of the November Leonid meteors was expected for 1898, but only a very small number were actually observed. Possibly next year will bring us to the thickest part of the stream, in which case we may then see a display comparable to those recorded in the years 1833 and 1866.

Variation of Latitude and the Constant of Aberration offer two problems to astronomical science that are now pressing for a satisfactory solution. For many years it had been suspected that terrestrial latitudes might be subject to small changes, and that these might possibly affect the results of ordinary astronomical observations. But in spite of all efforts to detect with certainty the existence of such changes, it was not until the year 1888 that the latitude variation was transferred from the domain of mathematical speculation to the arena of practical astronomy. To Küstner (now director of the Bonn observatory) belongs the honor of having first proved beyond a doubt that latitudes vary by observable amounts. His observations were made in Berlin, and he found that the latitude of that place was less by two-tenths of a second of arc in the spring of 1885 than it had been in the spring of 1884. Moreover, he had the courage to announce his discovery without circumlocution as a fact really existing, not merely suspected. His result has been abundantly confirmed by subsequent observers.

Let us inquire a little more closely what is meant by this variation of latitude. If we imagine two straight lines drawn from the centre of the earth, one to the pole, and the other to a given observatory, then the angle between these two lines is called the co-latitude of the observatory. The latitude, in the ordinary geographical or astronomical sense, is obtained simply by subtracting this co-latitude from 90° . It is evident that the co-latitude (and therefore also the latitude) will remain constant for any given observatory, if the pole maintains an immovable position on the earth. Now for the proper understanding of the present problem, we must define exactly what we mean by the pole of the earth. If we disregard, as we may, moderate irregularities in the earth's surface, we can take its figure to be a slightly flattened globe or sphere. The shortest possible line through the centre, and limited by the surface at each end, may be called the *axis of figure* of the earth. The points where this axis meets the surface are the *poles of figure*. But the earth has still another axis, viz.: the *axis of rotation*. About this axis the planet revolves once in twenty-four hours, giving rise to all the diurnal phenomena of astronomy. Constancy of latitudes would imply the relative fixity of these two axes. That each shall maintain continuously exactly the same position with respect to the other is the one necessary and sufficient condition for perfectly invariable terrestrial latitudes.

Now it is the axis of rotation to which all astronomical determinations of latitude are of necessity referred; for we must needs depend on the rotation phenomena for defining observationally the position in space of our axis. If then the axis of figure be subject to a slow revolution about the axis of rotation, there will be a corresponding variation of astronomically determined latitudes. The maximum amount of the variation will be the same as the small angle between the two axes, and its period will be equal to the time required for the rotation of the one axis about the other. At the end of every such period, the latitudes of all places on the earth should return to their original values.

From what has been said, we may conclude that up to the publication of Küstner's work in 1888, fundamental astronomy had adopted invariability of latitudes as a fact practically established. All the results of astronomical observations made prior to that date must therefore be subject to so much error as might be produced by assuming a constancy of latitudes in the discussion of the observations. Now the aberration constant is particularly liable to error from this source. It is evident, therefore, that a re-determination of this quantity was imperatively needed, and that the necessary observations must be arranged in such a manner as to take account of the effect of latitude variation. Careful study of the problem brought out the fact that the two quantities involved are entangled in such a way that no available method of research could prove satisfactory, unless it had for its object the simultaneous determination of both aberration and variation of latitude. It seemed best to employ what is known as the "zenith telescope method," and the best modification of this was suggested by Küstner himself. It will be impossible here to enter into the details of this instrument, beyond stating that the observations, when made, must be continued more or less through the entire night. They are especially important in the early part of the night, and again just before sun-rise, so that the observer can usually have from two to four hours rest in the middle of the night. Moreover, the observations need to be made on every fine night for a period of fourteen months, if it be desired to determine the aberration. For the

latitude variation the observations must of course be continued for a term of years,—indeed they must be kept up as long as we wish to trace the polar motion. It will be seen that the problem is one of great difficulty, testing to the utmost the patience and endurance of the astronomer. Moreover, it is known, that just as in the case of the solar parallax, the precision can be enhanced by making a simultaneous series of observations at more than one observatory. If the participating observatories are situated upon the same parallel of latitude, or very near it, the results obtained will enjoy a further increase of precision. This was first suggested by Fergola of Naples. The advantage consists in the possibility of observing just the same stars at all the observing stations, so that the *differences* of latitude of the stations are determined independently of any knowledge of the exact positions of the stars on the sky. This is most important, for the stars' positions are never known with absolute precision, being themselves but the results of fallible human observation. Moreover, the polar motion can be deduced from the latitude-differences of the observatories just as well as from the actual latitudes. If, for instance, the pole happens to be moving at a given time towards an American observatory, it will be moving away from observatories in Japan or the Philippine Islands. So that if we can but measure from time to time the latitude-differences of observatories properly situated, we can get an accurate and complete idea of the actual motions of the pole. The International Geodetic Association, which includes all the civilized nations, has now undertaken the systematic observation of latitude variation. Four stations will be established upon a single parallel of latitude. Two will be in the United States, one in Japan, and one in Sicily. Two private observatories will also participate voluntarily. Systematic observations will begin, it is hoped, about the end of 1899. Thus international official enterprise will take up this important problem, which has hitherto been left to the efforts of universities or individual governments.

From what has been said, it will be seen that the latitude variation may be regarded as one of the problems of astronomy still very far from a complete and satisfactory solution. It is particularly noteworthy that within ten years of the present day, the older, or exact, astronomy should offer a new problem so fundamental in character. The science that has been called "the perfect science" has shown that it can still advance. The accepted constant of aberration must also be regarded as subject to slight correction, so long as the latitude problem remains unsettled, especially as the most recent aberration results exhibit rather large discordances among themselves. To this we have already referred under SOLAR PARALLAX, and have called special attention to the close inter-relation of the various problems discussed here. Before leaving this part of our subject, we would refer the reader who may wish more complete and technical information to a series of articles by Chandler of Cambridge, Mass., published in the *Astronomical Journal*, and to another series by Albrecht, of Potsdam, Germany, published in the reports of the International Geodetic Association, and also in abridged form in the *Astronomische Nachrichten*. An interesting account of this year's meeting of the International Association has been published in *Science* by the United States delegate, E. D. Preston, of the United States Coast and Geodetic Survey.

Variable Stars.—Sixty-two new variable stars have been discovered during the year, including thirty-six found at the Harvard College observatory. Besides these, the researches of Bailey have brought out the variability of an enormous number of stars in some of the denser star clusters in the Southern hemisphere. It would appear as though in some of the clusters a very large proportion of all the stars change their light periodically, now blazing up to an unwonted brilliancy, and again sinking to comparative invisibility. No satisfactory explanation of these interesting phenomena has yet been given. They acquire an added interest from the important fact that the phenomenon of variability is not universal, since many clusters which have been brought under special observation fail to exhibit it. On the other hand, the cases when it does occur are not at all rare. There can be no doubt that the elucidation of this matter would throw much light on the question of the constitution of stellar clusters.

Comets.—The following are the comets that appeared in the year 1898.

1898 *a* was discovered by Perrine at the Lick observatory January 1, and was a return of Winnecke's periodic comet.

1898 *b* was discovered by Perrine at the Lick observatory March 19.

1898 *c* was discovered by Coddington at the Lick observatory on June 11. It was first found by photography.

1898 *d* was discovered by Tebbutt in Australia June 11, and was a return of Encke's periodic comet.

1898 *e* was discovered by Perrine at the Lick observatory June 14, and was just bright enough to be seen with the naked eye.

1898 *f* was discovered by Hussey at the Lick observatory June 16, and was a return of Wolf's comet.

1898 *g* was discovered by Giacobini at Nice, June 19.

1898 *h* was discovered by Perrine at the Lick observatory, September 13.

1898 *i* was discovered by Brooks, October 20.

1898 *j* was discovered photographically by Chase at the observatory of Yale University, New Haven, November 14.

It will be seen that the comets of 1898, though exceptionally numerous, were of a comparatively unimportant character. None were conspicuous enough to attract public attention. No less than six of the ten discoveries were made at the Lick Observatory, and of the remaining four comets, two were first seen in this country. The American comet record is therefore a particularly good one this year, and the showing of the astronomers of the Lick observatory is especially creditable.

Planetoids or Asteroids.—The year 1898 will be counted as a memorable one in the history of these small but interesting members of the solar system. Ever since the discovery of the sixth little planet, which took place in 1847, not one year has gone by without its discoveries of asteroids. Yet though their number has thus grown steadily as time went on, the general characteristics as to size and peculiarities of orbit have remained quite uniform. But an asteroid was discovered in 1898 that differs from all the others, and in a manner that makes it perhaps one of the most important bodies so far known to astronomical science. Like most of the recent planetoid discoveries, we owe this new one to photography. We have already pointed out, under *Astro-photography*, that the discovery of planetoids is one of the great advantages of this method of research. In fact, since December 1891, when Wolf, at Heidelberg, found the first photographic planetoid, only seven out of 111 new discoveries have been made by visual methods.

The process of hunting planetoids by photograph is quite simple. Plates are exposed in a comparatively small camera for two or three hours. During all this time the camera is moved with its mounting by clock-work or otherwise so as to follow the stars as they rise or set, and thus make the little star-images all maintain quite unmoved positions on the plate. Now if there be a planetoid anywhere in the region covered by the photograph, it will not appear as a dot like the stars, when the negative is developed. For its orbital motion will make the planetoid travel slowly among the stars, and its trace on the plate will therefore be a short line, and not a dot. The presence of such a short line therefore at once reveals the planetoid. Subsequent calculations will then show whether the discovery is a new one, or merely a re-observation of one of the planetoids already known. In cases of genuine new discoveries, it has been the custom in recent years not to assign a number and name to the new planet until enough observations have been made in the various observatories to permit the computation of a fairly accurate orbit. Pending the accumulation of these necessary observations, a temporary designation is given to the planetoid, and by this it is known until a permanent number has been assigned to it. The computation of preliminary orbits, and the assigning of these permanent numbers has been by common consent left to the astronomers of the *Berlin Astronomisches Jahrbuch*, an annual astronomical publication of the German government. As temporary designations, the successive letters of the alphabet have been used. And when the alphabet was exhausted, recourse was had to doubling the letters. Thus after planetoid Z would follow AA, AB, etc.

The following planetoids discovered during 1897 and 1898 have received their permanent numbers:

No.	Temporary Designation.	Discovery	Date of Discoverer.	Name.
426	D H	Charlois	Sept. 11, 1898	Monachia
427	D J	Charlois	Aug. 13, 1898	
428	D K	Villiger	Dec. 18, 1897	
429	D L	Charlois	Dec. 18, 1897	
430	D M	Charlois	Dec. 18, 1897	•
431	D N	Charlois	Nov. 25, 1897	
432	D O	Charlois	Nov. 18, 1897	Eros
433	D Q	Witt	Aug. 27, 1897	
434	D R	Wolf	Aug. 25, 1897	Hungaria

Of these No. 433, known temporarily as D Q, and discovered photographically by Witt at Berlin, is the extremely interesting planetoid to which we have called attention. Its special peculiarity consists in the fact that it approaches the earth much nearer than any other planetoid, or, indeed, nearer than any other known body in the heavens except our own moon. Now we have seen under SOLAR PARALLAX that perhaps the best method of determining our distance from the sun is by observation of planetoids. The greatest difficulty, as we pointed out, consists in the smallness of the available base-line, as compared with the distance separating us from the planetoid under observation. It is therefore obvious that if we can get a nearer

planetoid, we shall do away in a measure with this difficulty. It is a fact that we may hope for a determination of the parallax by the aid of 433 D Q that will be at least twice as accurate as any made up to the present time. The next favorable opportunity for attempting a "parallax campaign" with this planetoid will occur at the end of the year 1900. There will be still more favorable opportunities in 1917 and 1924. Astronomers will doubtless take advantage of this chance to advance a step nearer their goal of complete exactness. That the past efforts of men and nations will perhaps be thus replaced by the results of more favorable opportunity is not to be called an example of the futility of human effort in science. The successes of a dead generation have ever been called failures by the living. Yet upon such a succession of failures are based the foundations of all modern exact science.

A New "Runaway" Star.—One of the most interesting, and at the same time unexpected results of the Cape Photographic *Durchmusterung* was the discovery of a small star endowed with an extraordinarily rapid motion on the sky. Up to this time, the star numbered 1830 in the catalogue of Groombridge had the most rapid motion of any known star. It is moving across the face of the sky seven seconds of arc each year. Only sixteen stars in all are known to have "proper motions," as they are called, exceeding three seconds, and of these nine exceed four seconds, and only four exceed five seconds. On account of its rapid motion, then, 1830. Groombridge has been called the "runaway star."

When Kapteyn was measuring the plates made at the Cape of Good Hope for the *Durchmusterung*, he found one star of the ninth magnitude, that was lacking in the catalogues made in previous years by Gould at Cordoba in South America, though these catalogues covered the region in which the star was situated. On the other hand, a star was given in Gould's catalogue close by, which was not on the photographic plates. He at once wrote to Gill, and asked him to examine the sky, and see if a mistake could by any possibility have been made by Gould. Observations were at once made at the Cape observatory by Innes, and he was able to show without difficulty that we have here a case of remarkably rapid displacement of a star on the sky. The motion amounts to no less than $8''.71$ annually. Astronomers attach the greatest possible importance to the discovery of such exceptional cases of rapid motion. For it is always by a study of the unusual that new scientific truths are brought to light. There can be no doubt that this discovery alone is sufficient to justify all the labor spent on the whole Cape *Durchmusterung*. It also emphasizes the correctness of Argelander's judgment in advocating the formation of star-catalogues that should be very complete as to numbers of stars, even at some sacrifice of high precision. For it is only by cataloguing *all* the stars that we can be sure of sifting out those cases that present the most important and interesting peculiarities. It is altogether probable that a study of the faint inconspicuous stars will lead to results of far-reaching scientific interest.

Lunar Photography.—The Paris observatory has continued the publication of Loewy and Puiseaux's photographs of the moon. These astronomers have been engaged for some time in trying to improve the methods of lunar photography, so as to obtain a thoroughly complete and satisfactory series of pictures of the lunar surface. For making the negatives they have used the *equatorial coudé*, or bent telescope of the Paris observatory. This is a unique instrument, invented by Loewy, the present director of the observatory. The telescope tube is bent at right angles near the middle, and the rays of light are similarly bent within it by a plane mirror fixed in the tube. By this arrangement many convenient changes in the construction and mounting of the instrument are made possible. But there is the compensating disadvantage that the optical system as a whole is rendered more complicated by the introduction of the extra reflecting surface. There can be no doubt that each additional optical surface is likely to add its share to the sum total of optical imperfection belonging of necessity to every telescope. Still the lunar photographs show that the Paris astronomers have succeeded in overcoming very completely all these difficulties.

The improvements made at Paris in the methods of reproduction of the original negatives for publication show a decided advance upon anything we have as yet seen. Of course the most important thing from the point of view of the astronomer is the production of an original negative which shall be an absolutely exact copy of what actually exists on the sky. If necessary, all studies of the picture can be effected upon the original negative, thus avoiding every possible change or imperfection that might be introduced in the process of reproduction. But after all the larger astronomical public is necessarily unable to visit personally the place where the original negative is preserved. So that very perfect processes of reproduction are almost as important in reality as perfect methods of making the original. In cases like photographing the moon for the study of its surface detail, it is only by submitting the picture to many pairs of trained eyes that we can make quite certain that no important peculiarity has escaped detection.

Venus and Mars.—The various observers of these planets continue to differ as to their surface markings, and as to the rotation period of Venus. A very elaborate volume of observations of Mars has been published this year by Lowell of the observatory at Flagstaff, Arizona.

The Proposed great Telescope for the Paris Exposition of 1900.—It has been known for some time that a telescope was in course of construction for the next great Paris exposition which should altogether surpass in size anything attempted hitherto in the direction of telescope making. The work on the instrument has now progressed so far that it is safe to regard it as certain that the instrument will become an accomplished fact, and it may therefore be of interest to give here some details in regard to it. The object glass is to have a clear diameter of $49\frac{1}{4}$ inches, being thus $9\frac{1}{4}$ inches larger than the next greatest telescope, mounted recently near Chicago through the munificence of Mr. Yerkes of that city. The new instrument is even to be provided with two separate object glasses of the above great size: One will be adapted for ordinary visual purposes, and the other will be ground of the form suitable for making photographs. Thus the immense light-gathering power of the new instrument will be utilized as well in the newer form of observation by photography as in the older and more accustomed method of observing with the eye. A very radical departure from usual methods of construction in the new instrument will be its extraordinarily large focal length, no less than 197 feet. The usual proportion is about one foot of focal length for each inch of diameter of the lens, which would give in this case a focal length of only fifty feet. The longer focal length has the important theoretical advantage that it enables the optician to get rid very thoroughly of the unavoidable faults of all lenses, the so-called chromatic and spherical aberrations. For it must not be supposed that perfect lenses can be made either theoretically or practically. All telescope lenses are necessarily imperfect, and represent in their results more or less complete approximations on the part of the optician to the desired but impossible, complete perfection of the focal image. But the adoption of the long focus for the Paris instrument brings with it an attendant disadvantage. If it be mounted in the usual way with pivoted axes, so as to enable the astronomer to point the telescope at any part of the sky, its excessive length and weight will make it quite unmanageable. They have therefore adopted what is known as the "fixed telescope" plan. The instrument is mounted horizontally, and is not capable of any motions at all. The various parts of the sky are then brought under observation by reflection from a plane mirror placed outside the object glass of the telescope proper.

The greatest difficulty of this form of construction is the required plane mirror. It is evident that it must be of considerably larger size than the object glass of the telescope, if there is to be no sacrifice of the light-gathering power of the latter in any of the possible positions of the optical system consisting of the lenses and the mirror. In the present case the mirror is to be about 79 inches in diameter. Truly a huge undertaking, when we consider how rapidly the difficulties of grinding an absolutely flat surface increase with its size. We are able to announce, however, that this mirror has been quite successfully completed so that the carrying to completion of the whole instrument may be regarded as certain. The glass discs for the two object glasses have also been successfully cast by Mantois, and these are now undergoing the process of grinding. When finished, these lenses will be mounted on a series of railway tracks, so that they can readily be interchanged, when it is desired to pass from visual to photographic observations. The great outside mirror will be mounted on what is called a siderostat. This is an arrangement of pivoted axes, permitting the mirror to be turned in any desired direction. It will also be connected with clockwork, so that any planet or star once brought under observation, can be held in the centre of the field of view automatically, without further special attention from the astronomer. The following table contains the principal dimensions of the instrument.

Table of the Dimensions of the Telescope for the Paris Exhibition of 1900:

Diameter of lenses.....	$49\frac{1}{4}$ inch.
Focal length.....	197 feet.
Diameter of tube.....	59 inch
Weight of tube.....	23 tons.
Thickness of tube.....	$\frac{1}{4}$ inch.
Weight of each lens.....	1323 lbs.
Weight of lens with cell.....	1984 lbs.
Length of focussing screw.....	59 inch.
Diameter of mirror.....	$78\frac{3}{4}$ inch.
Thickness of mirror.....	$10\frac{1}{2}$ inch.
Weight of mirror.....	4 tons.
Weight of mirror, with cell.....	7 tons.
Weight of siderostat.....	50 tons.

ATHERTON, GERTRUDE FRANKLIN, American author, born in San Francisco, California, about 1858. She is great-grand niece of Benjamin Franklin. Her novels have been successful and include: *The Doomswoman* (1892), *American Wives and English Husbands* (1898), and *The Californians* (1898). She has lived in Europe since the death of her husband, George H. B. Atherton, a Californian.

ATMOSPHERE. See PHYSICS (paragraph Planetary Atmosphere).

ATWOOD, MELVILLE, scientist, died at Berkeley, California, April 25, 1898. He was born near Stonebridge, Worcestershire, England, July 31, 1812; went to the gold and diamond mines of Brazil; made a discovery in 1840 that increased the value of zinc ore; and in 1852 went to California and invented and introduced the blanket system of amalgamation. Mr. Atwood was one of the best known lithologists, microscopists, and geologists on the Pacific coast; he was a member of the Academy of Science and of the Microscopical Society of San Francisco, and a fellow of the Geological Society of London.

AUDUBON SOCIETY. See ORNITHOLOGY (paragraph Organization).

AUGUR, CHRISTOPHER COLON, was born in 1821 and died January 16, 1898. Having been graduated from West Point, he served in the Mexican War and in Indian conflicts. He was Major-General of volunteers in the Civil War; was wounded at Cedar Mountain; at close of war was brevetted Major-General; retired July 10, 1885.

AUSTRALIAN FEDERATION. An important event in the history of Australia during the year 1898 was the continuation of the movement for Australian Federation. For a number of years the idea of federation has been gaining supporters in all of the colonies, and on March 22, 1897, the Australian Federal Convention, consisting of ten delegates from each colony (except Queensland) elected by the people, held its first session at Adelaide. The federation movement, resulting in no way from military or external causes, developed chiefly by reason of the homogeneity and the mutual affinities of the inhabitants of the several colonies. At Adelaide Messrs. Barton and O'Connor, of New South Wales, and Sir John Downes, of South Australia, all lawyers of recognized ability, presented a constitution which they had drafted and which was adopted by the Convention and submitted to the several legislatures. In the following September the Convention met again, at Sydney, to consider the suggestions offered by the legislatures, but it adjourned in a week in order that Queensland might have time to choose delegates. None, however, were chosen by this colony, and, indeed, Queensland has thus far taken no part in the federation movement. The last session of the Convention was held at Melbourne, beginning Jan. 20, 1898 and adjourning *sine die* March 17th. The sessions of the Convention were marked by good feeling and a spirit of fairness and reasonable compromise on the part of most of the delegates.

The constitution framed at Melbourne was evidently based on the constitutions of the United States, Canada, and the Swiss Republic. Its main provisions were as follows: The Federal legislature was to consist of the Queen, represented by a Governor General; a Senate, in which each colony, or state, was to be equally represented by members chosen by popular vote; and a House of Representatives, whose members were to be proportionate to population. A cabinet was provided for and a Federal Supreme Court, the functions of which were to be similar to those of the American Supreme Court, and the judges were to remain in office during good behavior. The Senators were to hold office for six years, one half of them to be elected every three years; the members of the House of Representatives to be elected for a term of three years. The most marked digression of the constitution from the American system was in the establishment of a responsible ministry. Legislative power was to be divided between the Federal government and the States as in America; that is, the states to retain all powers not given to the Federal government. Among the subjects exclusively under Federal legislation were "commercial relations with other countries and among the several states, customs and excise, posts and telegraphs, military and naval defense, navigation and shipping, banking and currency, marriage and divorce." It was provided that money bills must originate in the House of Representatives; these the Senate, might accept or reject, but not amend. In the case of a deadlock between the two houses both were to be dis-

solved, and if the deadlock continued, two-thirds of both houses in joint session should decide the point at issue. In order to amend the constitution a majority vote in both houses first would be necessary; then the question would be submitted to conventions in the several states elected by majority vote of the people; and finally to become a part of the constitution it would be necessary that the measure be approved by a majority of these conventions.

The constitution was to be voted upon by the different Australian states, a fixed minimum for the affirmative vote being imposed in each state. If three colonies should ratify the constitution, the Convention agreed that federation might be accomplished and that application might be made to the Imperial Government for an enabling act. In New South Wales the minimum affirmative vote was raised from 50,000 to 80,000. This provision wrecked the federation measure. It was found when the returns came in from the June elections that while in general the majority for federation was almost two to one, the number of votes in New South Wales fell below the minimum limit. The vote in the several colonies for and against federation was as follows: Victoria, affirmative, 93,473, negative, 20,570; South Australia, affirmative, about 26,000, negative, about 16,000; Tasmania, affirmative, 13,496, negative, 2,900; New South Wales, affirmative, 70,990, negative, 65,619. West Australia cast no popular vote. Queensland was said to have no aversion to federation, but preferred to follow the example of New South Wales. With only three colonies voting in the affirmative, and two of these being relatively unimportant, it was thought best not to ask for the enabling act. A proposition was made looking to the adoption of such provisions in the constitution as would meet the wishes of the people of New South Wales, but the other states objected to this, and it is not clear how the difficulty can be got over.

With so great a majority in the colonies in favor of federation the action of New South Wales was bitterly disappointing to many, but on some accounts it seemed fortunate that the adoption of the minimum principle excluded her, for if she had joined the federation at this time her course would have been constantly hampered by a strong and hostile minority. The new constitution would have become a party issue in New South Wales and from the very first would have encountered vigorous opposition. It should be remembered that both Queensland and Victoria were carved out of New South Wales. It was not to be expected that the parent colony would occupy a subordinate position. Yet had she entered the federation at that time she could not have hoped that Sydney would be the seat of the new government, and she would probably have been thwarted in her free trade preferences. Some of the objections urged in New South Wales against the proposed constitution appear from the demands of the government for the following modifications: The federal capital should be located in New South Wales; the colony should exercise full rights of control over New South Wales rivers; the surplus of the revenue should be distributed per capita; bounties should be paid by the states granting them and not by the commonwealth; if the control of the railways be assumed by the states the debts must also be assumed. Objections were also made to the provision regarding the colony's portion of the contribution of the revenue to the commonwealth, and to the clause providing for equal representation in the Federal Senate; and New South Wales also demanded that the power of appeal to the privy council should be continued. Mr. Reid, Premier of New South Wales, suggested a new conference to consider a modification of the act of federation so as to meet the wishes of the people of New South Wales, but the other premiers refused to accept this proposition.

In some quarters it has been proposed that a limited federation be formed to consist of the three colonies which adopted the act of federation, namely, Victoria, Australia and Tasmania. With this as a nucleus, it was hoped that a complete federation would gradually result.

AUSTRIA-HUNGARY, an empire lying in the interior of Europe with an area of 240,942 sq. m. and a population on December 31, 1890, of 41,358,886, but as estimated in 1896, 43,800,213.

Agriculture and Mining.—There is a great variety in the raw products of Austria-Hungary. The chief occupation is agriculture, which is said to furnish employment to nearly three-tenths of the population. According to the figures for 1896 the leading crops of cereals in Austria were oats, rye, barley and wheat. In Hungary wheat was the most important crop and next to this were buckwheat, oats, barley and rye. Nearly 44 per cent. of the total acreage of Hungary consists of arable and garden land and nearly 37 per cent. of that of Austria. Forests abound, especially in the Carpathians, Alps and Central mountains of Austria-Hungary. They are administered by the state. The mineral wealth of the empire is considerable. The chief mineral products are coal, iron ore, pig iron, salt, silver and gold.

Foreign Trade.—The following statistics of the foreign trade of Austria-Hungary are taken from the United States Consular Reports for 1898. The total value of

the imports, exclusive of precious metals, amounted during the calendar year 1897 to \$308,680,000, and of the exports to \$314,000,000, having a balance of trade in favor of the empire of \$5,318,600, a loss of \$22,330,000 as compared with the previous year. The chief imports in 1897 were, in the order of their importance, cotton, grain, wool, coal and coke, silk and silk goods, coffee, tea and cocoa, flax, hemp and jute, machines, etc., iron and iron-ware, wine, fat and grease, and cotton yarn, and of these the largest increase in 1897 over the previous year was in grain. The other imports which showed an increase were wine, fat and grease, flax, hemp and jute, silk and silk goods, iron and iron ware and cotton. All the other imports mentioned showed a decrease. From this it will be seen that the importation of raw products in 1897 especially increased. There was also a large importation of manufactured products, being a considerable increase over the previous year. The principal articles of export in 1897 were, in the order of their importance, timber, mineral products, sugar, live stock, grain, leather goods, coal and coke, glass and glassware, beverages, woolen goods, paper, paper goods, etc., iron and iron ware, cotton goods, and linen goods. of which timber showed the greatest increase. There was also an increase in the exports of coal and coke, mineral products, beverages, cotton goods, paper, paper goods, etc., linen goods and woolen goods. The exports of the other products showed a falling off.

Commercial Policy of the Government.—The Imperial and Royal Ministry of Commerce has the chief management of commerce, industry, shipping, posts, telegraphs and telephones. Its duties include the initiation of negotiations for the conclusion of commercial treaties, the rendering of aid in the regulation of tariff, the management of commercial and industrial affairs, the rendering of aid in the promotion of industry, trade and commerce, etc. The government does much to encourage the development of trade. It assists the merchant marine by certain bounties or allowances and it remitted taxes upon all kinds of vessels from 1894 to 1898, inclusive. There are numerous industrial schools maintained by the state and a few supported by the separate provinces and receiving subventions from the state. It was reported in 1898 that in Austria there were 8 schools for the glass industry, 16 for lace and embroidery, 18 for basket ware. There were besides 15 state industrial schools, 4 art schools and 393 independent trade schools. For commercial education there were 12 high schools, 28 commercial high schools and 79 schools for advanced instruction. It was reported that the wide extent of technical education had favorably affected the export trade. The tariff policy of Austria-Hungary is that of moderate protection which resulted from the opposition of free trade tendencies manifested in the early seventies. It was alleged that the low tariff injured branches of the textile industry. In 1875 a return to a protective tariff policy was demanded with such emphasis that the government resolved to terminate the supplementary treaty with England. In 1878 the duty was increased on some classes of manufactured goods. Commercial treaties exist with all the principal European powers but in general the government persists in a policy of moderate protection.

Manufactures, etc.—The following statement of the chief causes of the decline of the manufactures of Austria-Hungary is quoted from the United States Consular Reports for September, 1898:

"(1) The conservatism of the people. While the English and German manufacturers are largely cosmopolitan, the Austrian remains provincial and strongly conservative. Innovations are still painful to him. He accordingly fails to keep abreast of the times and is distanced in the race for industrial and commercial supremacy.

"(2) High railroad rates. This is a mountainous country; the construction, as well as the operation, of railroads is expensive, and rates are correspondingly high. Austria's manufacturing centres, lying in the very heart of the European continent, are favorably situated with respect to inland traffic, but are at a great disadvantage in export trade. Moreover, while Austria furnishes Germany with a great deal of through traffic, and thus lowers the general cost of transportation in the latter country, she receives very little through freight from Germany in return.

"(3) There is a lack of mechanical skill in the southern and eastern portions of the monarchy, and, as such skill is largely the product of evolution, manufacturers have found that they can not afford to train a race to the manual arts.

"(4) High taxes. It is said that industrial enterprises are taxed more heavily in Austria than in Germany; and, as capital, like water, always follows the course of least resistance, it is not strange that movable plants occasionally cross the frontier.

"(5) Internal dissensions. Much of the energy of Austria which might be used in the development of her industries and foreign commerce seems to be consumed in race animosities at home. While in the German empire we find new industrial and export associations daily springing into life, the people of Austria seem to be absorbed just now in founding German, Slavic, or Italian clubs. Moreover, in the industrial centres of Bohemia, there is constant friction between the German manufacturer and his Slavic workmen, greatly impairing the efficiency of both.

"There is now a movement on foot in Hungary to bring about her 'economic emancipation' from Austria. It must be remembered that since the *Ausgleich* of 1867 the tariff union of the two halves of the monarchy rests only upon the precarious foundation of a treaty. Should the Hungarians refuse to continue the present arrangement, Austria's industries would doubtless sustain a terrible loss, and many now flourishing establishments would be crushed. The agricultural products of Hungary would in a measure have to find a new market, and the industrial interests of the two countries would probably suffer."

Railways, Telegraphs and Posts.—The length of railways open to traffic in Austria in 1896 was 10,240 miles; in Hungary in 1895, 8,375 miles; in Bosnia and Herzegovina, in 1897, 480 miles. In 1896 there were in Austria 30,495 miles of telegraph line and the number of messages carried was 13,213,633. In Hungary in 1895 there were 13,604 miles and the number of messages carried was 6,969,643. In 1896 there were in Austria 740,904,060 letters and postal cards carried in the mail and in Hungary in 1895 152,889,000.

Finance.—The finances of the empire are complicated by the necessity of distinguishing the revenues and expenditures for the whole empire from those for Austria and Hungary respectively. According to the *Ausgleich*, the nature of which is described in a succeeding paragraph, the cost of administering the common affairs of the two divisions of the empire is divided in a certain proportion between Austria and Hungary. The estimates for common affairs for 1898 place the revenues as 161,185,025 florins, the florin being equivalent to 20.3 cents in United States currency. In 1897 the general debt of the empire was 2,762,752,000 florins. Austria's special debt was 1,490,373,000 florins and Hungary's special debt 2,177,685,000, making a total of 6,430,810,000 florins. There is in addition a common floating debt which at the beginning of 1897 amounted to 138,949,109 florins.

Currency.—Since 1892 Austria-Hungary has been trying to rid itself of the evils which inevitably result from an unstable paper currency. A commission was appointed to examine the question in that year and reported in favor of the adoption of a gold standard. Since then it has been the policy of the government to redeem bank notes upon demand in gold and retire them. The government notes sank from 343,970,577 florins in 1892 to 119,315,410 florins at the close of the year 1897, and the latter amount was covered by a gold redemption fund in the treasury. The bank notes were increased during the same period, but a much larger proportional gold reserve was held in the vaults to redeem them. In the meanwhile the stock of gold in the country increased to the extent of 300,000,000 florins. The policy of Austria-Hungary, therefore, has been to reduce government notes and to substitute for them bank notes along the line of reform which is demanded by a party in the United States. (See article CURRENCY REFORM.) The monetary unit is the crown, which is worth 20.06 United States money. Between the passage of the law of August 2, 1892 and December 31, 1897, there were coined 963,824,100 crowns of gold, and 158,687,000 crowns of silver.

Labor Interests.—On October 1 the new department entitled Imperial and Royal Department of Labor Statistics entered upon its duties, which were to consist in collecting and publishing labor statistics for the information of legislators. It was created by a resolution of the Emperor.

Government and Political Situation.—In order to understand the political situation in Austria-Hungary it is necessary to speak of two or three points in the constitution and review the events of 1897. The Austro-Hungarian monarchy was established by the law of December 21, 1867. It consists of Cisleithania, or the Austrian empire proper, and Transleithania, or the Hungarian kingdom, each being subdivided into provinces. Besides the provinces included in these divisions there are Bosnia and Herzegovina, which have been administered by Austria since 1878, but are legally dependent on the Porte. In each province of the empire there is a local diet, having charge of its home affairs. The imperial parliament or *Reichsrath* consists of a house of lords and a house of deputies. Hungary also has a parliament similarly constituted at Budapest. The house of lords is composed of ecclesiastics and members of the privileged classes, and the lower house comprises representatives from the towns, chambers of commerce, and the rural districts, elected partly by direct and partly by indirect vote. The Emperor appoints the ministers, who may retain office even if they have not a majority in the house. They can be removed only by impeachment. The Minister of Foreign Affairs, Minister of War, and the Minister of Finance manage the common affairs of the two divisions of the empire, but the legislation in regard to these common affairs is in the hands of a board of Delegations (*Delegationen*) chosen from both houses of the *Reichsrath*. The division of the budget between the Austrian and Hungarian governments has been secured by a decennial compact called the *Ausgleich*, by which Austria is required to contribute 68 $\frac{1}{10}$ per cent. and Hungary 31 $\frac{1}{10}$ per cent. The Austrians have latterly complained of the excessive contribution which this arrangement lays on them. As the date of its

expiration (Jan. 1, 1898) approached, an effort was made to bring about a provisional arrangement for a year, in order that an agreement might be reached for a new *Ausgleich*. It was the struggle over this so-called *Provisorium* which led to the disgraceful scenes in the Austrian parliament in 1897; but the real difficulty lay in the racial question, particularly in the dispute over the use of the Czech tongue as the official language in Bohemia. The greater portion of the population of Bohemia, Moravia and Silesia is Czechish, the Germans constituting about three-eighths. The latter have complained of oppressive government and demanded a separate administration. A decree was issued by Count Badeni in the spring of 1897 permitting the use of the Czech tongue in lawsuits in any court of Bohemia even where the Czechs numbered only a small fraction of the population. The Germans declared this a violation of the constitution and after opposing it in many ways finally resorted to obstructive tactics in the *Reichsrath* on the occasion of the debates over the *Provisorium*. This was the main cause of the confusion that so long reigned in that body, but there is great difficulty even under favorable circumstances in legislating for such discordant peoples as compose the empire. In Austria-Hungary it must be remembered there are eleven different languages spoken. Even in the army the utmost confusion has prevailed on account of this racial diversity. In the *Reichsrath* the members carry on their discussion each in his own language and but few are able to follow the speeches of all.

Political Parties.—The poles are the most numerous political party in the *Reichsrath* and have attempted to gain control of the house with the idea of winning for themselves self-government in Galicia. Another strong party is that of the Czechs, who aim at the withdrawal and the detachment of Silesia, Bohemia and Moravia from Cisleithania. Their ultimate aim is also self-government, but they are divided among themselves into a conservative and radical element, known respectively as the Old Czechs and Young Czechs, the latter having strong Panslavist tendencies. Other political parties as enumerated by an Austrian writer in a recent article are the Conservatives, comprising the nobility and the Roman Catholic clergy, whose principal aims are the reestablishment of clerical influence over the schools, the retention of class privileges and opposition to any democratic innovations; the Catholic People's Party differing somewhat from the former on economic questions, but having substantially the same ecclesiastical aims; the Southern Slavs who aim at the formation of a South Slavonic state including Slavonia, Croatia, Dalmatia, Bosnia and Herzegovina; the Christian Socialists who are in reality Anti-Semites; the German Pro-class privileges and opposition to any democratic innovations; the Catholic People's Party which aims at securing the ascendancy of German influence and whose more radical members desire an actual union with Germany; the Italians who wish a union with Italy; and various socialistic and democratic groups. In the Hungarian parliament the condition is similar. The members of the Liberal Party who favor the union with Austria on the basis of the compact of 1867 are progressive in educational and ecclesiastical matters, but arouse racial bitterness by their constant effort to Magyarize Roumanians, Germans and Slavs. The minority consists of the clerical or Roman Catholic Party and the radical or Independent Party. The latter desires a mere personal union with Cisleithania, aiming at complete independence for Hungary. Hungarian politics are further complicated by the desire on the part of the Germans from Transylvania to keep their nationality, by the efforts of the Roumanians to secure a union with Roumania and by the Croatian hostility toward Magyar domination.

HISTORY.

Disturbances in the Reichsrath.—In November, 1897, the trouble in the *Reichsrath* reached a crisis. The German members angered by a ruling of the President, Dr. Abrahamovitch, seized the tribune and held it against the officers of the *Reichsrath* who tried to dislodge them. A fight followed and several members were hurt. The friends of the President now adopted a code of signals by which they were able to carry on parliamentary business in spite of the noise and confusion. This so enraged the Germans that they made a violent attack on the president who was saved only by calling in the police. Popular outbreaks took place in Vienna, as a result of these disturbances in the *Reichsrath*. On the 28th of November, Badeni resigned and it was announced that Baron Gautsch von Frankenthurn would assume the premiership. This was hailed by the Germans as a triumph for their side. It was followed by Czechish outbreaks in Prague and other towns of Bohemia. The Germans were set upon by the rabble and their houses were plundered. The new ministry promised to modify the language ordinances, and adopted a conciliatory policy toward the Germans. This policy was followed also by the ministry of Thun-Hohenstein. When the *Reichsrath* assembled on March 21, 1898, regular business was conducted. The Hungarian parliament passed an act continuing the terms of the old *Ausgleich* till the end of 1898, but the Austrian house did not agree to it. In the summer of 1898 the

old trouble in the Austrian body arose. In the first days of June it was evident that no parliamentary business could be transacted on account of the constantly growing hostility between the Czechs and the Germans. As a matter of necessity both parties acquiesced in the assumption of extraordinary authority by the Emperor who, it was supposed, intended to modify the language law in favor of the Germans.

Agrarian Troubles.—Throughout the year 1898 there arose Agrarian disturbances in Hungary. One of the reforms aimed at was the subdivision of large landed estates. At Budapest a mass meeting was held by agricultural laborers, and demands were made for an eight hour law, free education, universal suffrage, secret ballot and the abolition of the army. In Galicia too there has been Agrarian discontent as well as a violent outbreak of Anti-Semitism. See AGRARIAN MOVEMENT and HUNGARY.

Continuance of the Language Dispute.—During the war between Spain and the United States, Austrian sympathies were decidedly on the Spanish side, but the disorganized condition of her own internal affairs made it evident that even if she had wished she would have been unable to act with any vigor against us. In the summer of 1898 it was apparent that these dissensions over the racial questions were increasing rather than diminishing. The Emperor carried on the administration as an autocratic ruler. The agitation of the German element against the Badeni ordinances became more violent than ever, and at last these ordinances were repealed. On their face they would not seem to work injustice to either party, for they merely provided that the two languages should be on the footing of absolute equality. All officials in Bohemia had previously been required to know German, and the change would not seem to have been unfair to the Germans. Yet the latter urged that while educated Czechs spoke German, it was unjust to require Germans to speak what was merely a Slav dialect. The German language, they urged, was the language of a great commercial and literary nation and was spoken all over the world. Besides this there were upwards of seventy administrative districts in Bohemia where the Slav element amounted to only one per cent. of the population. It was regarded as absurd that a letter-carrier in these districts should be required to write and speak the Czech language. But the question rests on a broader basis. It involves the whole relation of the two races. Although Bohemia surrendered her crown to the Hapsburgs with the understanding that her independence should be unimpaired, there has been for centuries an effort to crush out the national spirit of the Slavs. German colonists were planted there and everything was done to impress the German character upon the people. The Germans regarded the Slavs as an inferior race. Rather than admit their equality they would apparently have preferred a union with the German Empire of the Hohenzollerns. The Hungarians sympathized with the Germans in their struggle for they too had a dread of Czech influence. The repeal of the ordinances of Badeni was regarded as a triumph for the Germans. It left the Bohemians the aggrieved party and had in it an element of danger from the fact that it might tend to increase their friendship for Russia, and their hope for the formation of a new Slavonic state whose autonomy should be guaranteed by the great power of the north.

The session of the *Reichsrath* closed in June after new riots in consequence of the suspension of the municipal council in the city of Gratz. The ministry worked along at the language ordinances in an effort to adapt them to the wishes of both parties, but in vain. The Delegations which met at Budapest on May 9 could come to no agreement on the military and naval budget, and a joint commission afterwards formed to determine the quotas from Hungary and Austria could not unite on any terms.

Change in the Tactics of the Opposition.—The opposition of the Austrian Germans to the language ordinances was intense. For nearly a year they had obstructed all parliamentary action, and in the spring of 1898 they bound themselves in a league which should fight every government that maintained the language decrees. By their obstructive tactics they hoped to make parliamentary government impossible and to prevent the conclusion of the *Ausgleich* with Hungary. When parliament was summoned at the close of September, 1898, the opponents of the government were still sanguine over the success of the obstructive policy. Suddenly, however, these German factions changed their tactics entirely. They declared, with the exception of the small Schoenerer group, that they would abandon obstruction and discuss the *Ausgleich* amicably. They based this change of policy on the somewhat childish ground that the government had counted on the continuance of the obstructionist tactics, and that it was the duty of the opposition to disappoint the government. This "policy of perversity," as it was called, is said to have rested on a very different ground. This was the expectation that the Thun cabinet would checkmate the opposition, if it persisted in its policy, by dissolving parliament, repressing agitation by means of imperial decrees and then making an arrangement with Hungary as to the *Ausgleich*. Accordingly the opposition faced about and made a virtue of necessity, claiming that it changed its policy of its own free will. Whether or not this account

of the matter is complete and impartial, the fact remains that the opposition desisted from its obstructionist tactics and parliament set to work quietly to discuss the *Ausgleich* bills, presumably with the intention of rejecting them in the end.

There was peace for a time but in October dissension showed itself in the German party. In November a motion to impeach the Premier was rejected amid scenes of disorder. The parliament then went on to discuss the impeachment of ex-Premier Badeni. The commissions to adjust quotas of Austria and Hungary in the naval and military budget met again in October, but came to no agreement.

Anti-Semitic and Other Disturbances.—Among the other political disturbances of the year were various Anti-Semitic and racial disorders in several parts of the empire. Vienna continued to be the centre of Anti-Semitism, whose apostle and principal leader is Dr. Lueger the burgomaster; but the most violent outbreaks of the craze occurred elsewhere. In June the peasantry in Galicia broke out into Anti-Semitic riots on two occasions. On the first, they entered the towns, mobbed the Jews, and destroyed much property both public and private. On the second, riots broke out in more than thirty villages and resulted in the deaths of sixteen Jews. The troops put down the riots and killed several of the rioters. Martial law was declared in two districts in June, and in a large part of the country the minor stage of siege was established. The assassination of the Empress led to outbreaks against the Italians, especially at Trieste, where a German-Italian fracas took place resulting in six deaths. Anti-Italian demonstrations also occurred at Gratz and in many other parts of the empire.

The Jubilee.—On May 8 the celebration of the jubilee of the Emperor Francis Joseph began with the opening of an exhibition to illustrate the industrial and agricultural progress of the reign. Other features of the celebration began in July but they had not yet come to their climax in the shape of a formal celebration of the anniversary when the public mind was thrown into consternation by the murder of the Empress, by the Italian anarchist Luccheni on September 10. (See the article ELIZABETH, EMPRESS OF AUSTRIA.) On account of this bereavement the plans for further jubilee festivities were postponed. The celebration was resumed on December 2, and was observed by ceremonies in the churches and schools and at the army posts. Ceremonies were also held at Paris, Rome, Berlin and other foreign capitals. The Emperor publicly thanked the army for its loyalty and bravery throughout the reign, and the anniversary was also celebrated by the granting of amnesty to political offenders in Hungary and by the remission of penalties inflicted for various offences including that of *lèse-majesté*. The affection with which all Austro-Hungarian subjects regard the Emperor Francis Joseph was shown unmistakably during the anniversary celebration.

Relations with Germany.—The expulsion of Austrian Slavs from Prussia, of which an account is given in the article GERMANY (q. v.), aroused much indignation in Austria. This policy was pursued by Prussia with rigor during the autumn of 1898, and early in December evoked a statement from the Premier, Count Thun, which caused considerable comment in political circles throughout Europe. He stated that the foreign office had repeatedly protested against these expulsions and had received in return reassuring promises, but that if Prussia continued to disregard the treaty rights of Austrian subjects the government would take active measures to defend these rights. This was taken in some quarters as a sign that the *Dreibund* or triple alliance was on the point of dissolution.

At the close of the year the *Ausgleich* dispute still seemed far from settlement, but it was reported at the end of December that the existing arrangement had been continued by imperial decree. For an account of the violent scenes that marked the discussion of this question in the Hungarian parliament toward the close of the year, see the article HUNGARY.

AUTOMATIC WRITING. See PSYCHOLOGY, EXPERIMENTAL (paragraph University of Iowa).

AUTOMOBILE. This is the generic name covering all forms of self-propelling vehicles for use upon country roads or city streets, whether driven by steam produced by the combustion of fuel, stored steam, compressed air, oil or gasoline engines, or by electric motors taking current from accumulators. From first to last a variety of names have been applied to such vehicles, some taking their title from the exact form of motive power, such as steam carriage, electric cab, others called motor-carriages, auto-trucks, etc.

Contrary to the general impression, automobiles, or motor vehicles as they should

be called, are not of recent origin, but date back to the early days of the steam engine, to the time of Sir Isaac Newton who in 1680 proposed a form of steam carriage, which at best could be nothing but a toy, but it embodied the essential features of a steam automobile. It consisted of a suitable carriage supporting a steam boiler provided with a nozzle projecting to the rear, from which steam issued under considerable pressure. The reaction upon the boiler drove the carriage ahead. In 1790 Nathan Read patented and constructed a model steam carriage in which two cylinders operated racks running in pinions on the driving shaft. The first actual experiments were made in 1769 by a French army officer, Nicholas Joseph Cugnot, who built a three wheel carriage. Later in 1770 he built another and larger carriage, still preserved in the *Conservatoire des Arts et Métiers*, Paris, which was intended for the transportation of artillery. The engine of this consisted of two 13-inch single acting cylinders connected by means of pawls to the single front wheel of the wagon. In front of this wheel was suspended the tank-like boiler. In 1784 James Watts' assistant, a man named Murdock, constructed a model carriage operated by a grasshopper steam engine, which as a model was most successful. In America Oliver Evans as early as 1786 suggested a form of road wagon, and in 1804 made estimates and calculations which he laid before the Lancaster Turnpike Co., to show that a steam road wagon could be constructed to transport 100 barrels of flour 50 miles in 24 hours, at less expense than 10 wagons drawn by 5 horses each could do the same work.

About 1786 William Symmington constructed a motor carriage which was successful enough to be mentioned. In 1803 Richard Trevithick built a full sized carriage which was exhibited in London, having driven itself 90 miles *en route* from Camborne where it was constructed. In 1821 Julius Griffiths of Brompton, Middlesex, England, and later in 1822 Goldsworthy Gurney, Burstall, and Hill all constructed steam carriages. David Gurney in the year 1827 built and operated a steam carriage which included all such features as using steam expensively, feed water heating, superheating of steam, a forced draft, tubular boiler, etc., and may be regarded as the first really practical motor carriage. In it Gurney made frequent and long journeys covering at times as much as 85 miles in 10 hours. He was excelled by Walter Hancock, who after considerable experimenting established several steam stage lines for passenger traffic. One of these vehicles ran between Cheltenham and Gloucester for 5 months, making the trip of 9 miles in 55 minutes, traveling a total distance of about 3,500 miles and carrying 3,000 passengers without delay or accident. He alone constructed 9 carriages capable of seating 116 passengers while at that time there were in operation in or near London 20 steam carriages. This boom was met by hostile legislation brought about by coach makers and operators, and the competition of steam railways rapidly growing into a useful form, and was given such a check that almost nothing was done during the following 25 years. An example of how well the subject was understood at that time is afforded by the report of a committee of the British House of Commons, appointed in 1831 at the height of the dispute. The report concluded:

1. That carriages can be propelled by steam on common dirt roads at an average rate of 10 miles per hour;
2. That at this rate they have conveyed 14 passengers;
3. That their weight, including engine, fuel, water and attendants may be under three tons;
4. That they can ascend and descend hills of considerable inclination with facility and safety;
5. That they are perfectly safe for passengers;
6. That they are not (or need not be, if properly constructed) a nuisance to the public;
7. That they will become a speedier and cheaper mode of conveyance than carriages drawn by horses;
8. That, as they admit of greater breadth of tire than other carriages, and as the roads are not acted on so injuriously as by the feet of horses in common draught, such carriages will cause less wear of roads than coaches drawn by horses;
9. That rates of toll have been imposed upon steam carriages, which would prohibit their being used on several lines of road, were such charges permitted to remain unaltered.

Following this set-back to motor carriage experimenting little or nothing was done, now and then a sporadic attempt would be made to revive an interest in the art, but it is only within recent years that any real work has been accomplished. Within recent years, say the last five, the construction of automobiles was entered into with such a rush that it is beyond the scope of this article to attempt to explain all the various machines that have been developed. All may be classified, however, under vehicles propelled by motors, which come under the following heads. 1. Steam boilers and engines, burning coal or coke, burning compressed or special fuels, burning petroleum, crude or refined, burning gasoline. 2. Oil or vapor engines, petroleum, gasoline, naphtha, acetelyne. 3. Compressed gases, air, carbonic acid, with a possibility of liquid air. 4. Electric motors, accumulators, trolley devices, at the side of road. So far the most satisfactory results have been obtained with the steam, oil and electric carriages.

In July 1894, the *Petit Journal*, of Paris, arranged a competition which took place from the 19th to the 22nd; 102 vehicles were entered but at the end of a preliminary test run of 31 miles at a minimum allowable speed of $7\frac{1}{4}$ miles, only 14 petroleum and 7 steam carriages were left for the final run from Paris to Rouen, a distance of 78 miles. All the petroleum and three of the steam wagons completed the run, the winners making an average speed of $10\frac{1}{2}$ miles per hour. This was followed by a race from Paris to Bordeaux and return in which 1 electric, 6 steam and 14 petroleum carriages took part. Nine of these covered the distance in the appointed time, and shared in the prizes. On Oct. 15th, 1895, occurred the Tunbridge Wells competition, organized in London under the direction of Sir David Salomons. This was conducted on a track of about 546 yards in length and like the two previous contests did little to advance the art.

The Chicago-Waukegan race, held on Nov. 21, 1895, under the auspices of the *Chicago Times-Herald*, and repeated on Nov. 28, was productive of good results, for complete records were taken and considerable data obtained.

In September 1896, a race held from Paris to Marseilles and return under the auspices of the Automobile Club of France proved of interest but resulted in little additional information.

A race over a course of 200 miles arranged by the London *Engineer* separated the contestants into four classes: 1. Motor cars for four or more persons, not weighing more than two tons; 2. Carriage for two or three persons, not weighing more than one ton; 3. Carriage for conveying one ton of freight, not weighing more than one ton; 4. Carriage for conveying one ton of freight, not weighing when loaded more than two tons; 5. Car for conveying 500 lbs. of freight, not weighing when loaded more than one ton.

The next trial occurred again in Paris, in February 1897, under the direction of the Automobile Club: It was international in character and intended to encourage the construction of automobiles. Carriages suitable for use upon the streets of Paris were entered, the conditions of the contest being based upon results of tests of the cab service of that city. All competitors were required to make 40 miles in 16 hours allowing two stops, one of half an hour, and one of an hour for breakfast. This run was to be made for twelve consecutive days over twelve different routes selected with reference to gradients. Within the city the speed was limited to 12.4 miles per hour. Each vehicle was required to make the twelve trips with the complement of passengers and baggage called for in its designs or had to carry corresponding.

In all 26 motor vehicles entered the race of which 14 were equipped with electric motors and 12 were operated by petroleum distillate engines. As a basis for comparison of cost, the daily expense of running an ordinary Paris cab pulled by a horse was fixed at 19.26 francs (\$3.85). This sum included all expenses, and also the average use of $3\frac{1}{2}$ horses per cab employed.

The first class of vehicles entered covered those with a single motor, where the power is transmitted to motor wheels through an intermediary; with gearing permitting a mechanical variation in speed. Under this head came the Peugeot coupé as a type propelled by a gas-engine and intended to carry three passengers, without baggage, or a useful load of 462 lbs. This vehicle was made up of a closed body, with two seats capable of carrying four passengers, and it did frequently carry this number during the trial. The driver or operator has his seat in front, and controls the apparatus for directing and changing speed and operates a brake-pedal. Attached to this front part is the naphtha reservoir. The motor is placed in the rear of the carriage body. The total weight is 2,838 lbs., with 1,509 lbs. on the front wheels and 1,329 lbs. on the back wheels. The out-to-out width of the vehicle was 5.25 ft., and the total length was 9.18 ft.

The motor used, with petroleum distillates, was built on the Peugeot system, the charge being exploded by incandescent tubes. It developed 6 horse-power and weighed 231 lbs., with its fly-wheel and bed-plate. The normal revolutions were 680 per minute. The gearing arrangement permits four changes of speed—3.7, 6.2, 9.3 and 12.4 miles per hour, and a backward speed of 9.3 miles.

The average speed made was 14 miles per hour, with 3.7 miles per hour on an 8.2 per cent. grade. The daily cost of running this vehicle was \$5.55; of which sum \$2.17 was for oil, etc., consumed, and \$3.28 was for other expenses.

Under the head of electrical motors the Jenatzy coupé is taken as a type. This cab was intended to carry two passengers, or a useful load of 308 lbs. It was made up of the ordinary cab-body with a bracket-seat, though this third seat was not used for a passenger during the trial. The driver sat in front and there handled a directing-bar, speed-variant and brake combined, and under foot was a pedal operating a friction-brake. The total weight was 3,964 lbs.; with 1,854 lbs. on the front wheels. The extreme width of the vehicle was 5.9 ft., and the extreme length 9.2 ft. The motors $4\frac{1}{2}$ horse-power; but it may easily develop, according to the claim of the builder, 10 to 12 effective horse-power. Two normal speeds are arranged for—3.7

and 7.4 miles per hour; for the first speed the two batteries are connected in parallel, and for the second speed, in series. Special gearing is provided for passing from 3.7 to 5.6 miles speed, and from 7.4 to 12.4 miles speed, and intermediate speeds can be obtained by introducing momentary resistance coils. The accumulators form two batteries of 22 elements each; each enclosed in a box; one under the driver's seat and one behind the carriage. These two boxes are easily opened for taking out and replacing the batteries.

On the level the batteries in parallel gave an average speed of 5.27 miles per hour; in series they gave a speed of 10.4. On a grade of 8.2 per cent. the batteries in series gave a speed of 4.9 miles per hour. The daily cost of operating the Jenatzy coupé was \$4.05, of which 80 cents was for the repairs to the accumulators and 34.4 cents was for the electricity; the rest went for general expenses.

The second class in the test included vehicles with a single motor, where power is transmitted by motor-wheels by means of invariable gearing, with a differential and chains; and where the variation in speed is secured by a corresponding variation in the speed of the motor. Under this head the electrically propelled Jeantaud cab is taken as a type. This cab is intended to carry two passengers, or a useful load of 308 lbs. Its cost is \$2,800. It is a four-wheeled cab, with the forward wheels carrying a box enclosing the accumulators; the driver is behind, and there controls all movements. The motor and differential gear are under the cab. The total weight of the cab is 3,102 lbs., with 1,419 lbs. over the front wheels. The extreme width of the vehicle is 5.08 ft., and the extreme length is 9.7 ft.

The motor and shaft of the differential are placed in a closed box, with the ends of the differential shaft projecting and carrying pinions for the sprocket chains; this motor, with its transmission gear, weighs 330 lbs., and has a normal power of $3\frac{1}{2}$ to 4 horse-power. Different variations of excitation and the coupling of the batteries permit speeds ranging as follows: 4.34, 7.44, 9.3 and 11.2 miles per hour. Intermediate speeds are obtained by momentary resistances introduced through the pedal of the electric brake. The accumulators contain 44 elements and weigh in all 880 lbs. Transmission is by a sprocket-wheel and chain connecting the ends of the differential-shaft and the corresponding motor-wheel.

The mean maximum speed made in the trial was 10.5 miles per hour; the daily cost of running this cab was fixed at \$3.96.

A Jeantaud landaulet, was also submitted to test, which carried two passengers and cost \$2,800. It weighed 3,652 lbs. Accumulators, weighing in all 1,005 lbs., were used, and the general plan of transmission, etc., was similar to the cab first described. The daily cost of operation was fixed at \$4.04.

The third class of vehicles included those with two motors, one for each motor-wheel; geared directly to it with no provision for change of speed, except by changing the speed of the motor.

To this type belonged the Krieger carriage, arranged so that the body of the carriage could be changed without interfering with the motor mechanism. The coupé and victoria types would carry three or four passengers without baggage; the useful load is 462 lbs., though in the trial they often carried 616 lbs. Either of these carriages could be sold for \$2,400 each.

In these carriages the accumulators are stored in two boxes; one under the seat of the driver, and one behind the body of the carriage. There are two motors, one for each front wheel, and these are both motor and directing wheels, the motors being placed directly over the vertical pivots. The coupé weighs 3,608 lbs.; the victoria 3,498 lbs., and the coupé, with a compartment for baggage, weighs 3,894 lbs.

Each of the two electric motors has a nominal power of 3 horse-power, and weighs about 143 lbs. Varying speeds of from 3 to 12 miles per hour are obtained by means of a series-parallel controller. In the trial, speeds of 5.5, 12.3 and 15.9 miles per hour were made on the level with batteries in series; on a grade of 8.2 per cent. the speed was 3.7 miles per hour in series. The total daily expenses of running the three types of Krieger carriages were fixed at \$4.05 to \$4.06.

In its general conclusions the jury said that one of the most striking features of the trial was the preponderating influence of the cost of repairs to the accumulators and the pneumatic tires, upon the daily expenses of running electric motor-vehicles. The small quantity of electrical energy consumed on this total course of 347 miles, on some of the most crowded streets of Paris, and the small cost of supplying this energy, was one of the surprises to the jury. In the daily expenses for the Jenatzy, Krieger and Jeantaud motor-carriages the specific energy supplied only cost, on the average, 35.4 cents, 34.8 cents and 20 cents respectively. This extremely low cost, seems to render it almost useless to seek for better methods of utilizing the electric motor in propelling vehicles. But while the consumption of energy has so slight an influence upon the daily cost of operation, the enormous general expenses which swell this cost must not be lost sight of. The electric motor must be designed to reduce to a minimum the consumption of energy on streets with steep gradients,

and so regulated and controlled that an inexperienced driver can not communicate to the motor currents disastrous to the accumulators.

As to speed, while this was generally satisfactory, the jury hoped that in another year makers would submit motor-cabs which will better meet the demands of actual cab practice in Paris, and with as small a consumption of energy as possible, meet the following speed conditions:

- 4 miles per hour in seeking passengers.
- 5 miles per hour mounting 5 per cent. grades.
- 7.5 miles per hour on grades from 2.5 to 5 per cent.
- 9.3 miles per hour as an average in ordinary streets.
- 12.4 miles per hour in open and uncrowded streets.

From May 24 to 27, 1898, a series of trials were held at Liverpool, England, under the auspices of the Self-Propelled Traffic Association. This competition was the outcome of an effort on the part of the Liverpool Chamber of Commerce to secure improved methods of transportation between the port of Liverpool and inland towns, also of haulage between the docks and warehouses in the city. In addition the test had the further object of encouraging builders to experiment and construct motor propelled vehicles upon the lines indicated and to provide an opportunity for the public to see something of the progress being made in England. The routes selected were between 30 and 40 miles in length and runs were required to be made on four successive days. It was required that the vehicles be capable of going anywhere that a horse drawn vehicle carrying the same load could go, and further that it be capable of working into or out of an embayment or loading berth $1\frac{1}{2}$ times its own length.

In making the awards the following were taken into consideration:

- (a) Cost: Economy of working including attendants.
- (b) Control: Stopping, starting, changing speed, steering and reversing particularly under adverse conditions, such as on inclines, or in confined spaces;
- (c) Working: Noise, smell, visible vapor, dust or other nuisances when traveling; number of mechanical operations, requiring attention from the driver; efficiency of brakes; time occupied in preparing the vehicle for services on the road; ability to start from rest on an incline of 1 in 16; speed, within legal limits; distance run without taking or receiving supplies of fuel, oil, gas, electrical or chemical materials, or electrical current, water or any agent employed for actuating the motor or assisting its working; ability to complete the course without stopping to effect repairs, adjust parts, apply lubricants, or for any other purpose or cause not provided for in the itinerary; freedom from heat down of any nature.
- (d) Construction: Strength of frame and working parts; quality of workmanship; efficiency of springs; freedom from complicated or over refined parts; facility with which repairs can be effected; capacity of bunkers, oil and water tanks; ratio of available to total platform area; ratio of tare to power of motor; ratio of tare to weight of freight carried during the trials.
- (e) Steam propelled vehicles: Action of feed pumps or injective; ample supply of steam; consumption of fuel and water per mile; leakage of steam or water; arrangements for stoking.
- (f) Oil propelled vehicles: Efficiency of ignition; regularity of carburation and explosions; range and graduation of speed of vehicles, and smoothness with which changes of gear are effected; circulation and weight of cooling water; consumption of oil per mile; leakage of pipes or tanks.

The two circular routes selected were surfaced as follows:

Paved.	Partially Paved.	Macadam.	Total Length.
A: 11.0 miles.	6.4 miles.	18.2 miles.	35.6 miles.
B: 6.6 miles.		29.3 miles.	35.9 miles.

Intermediate depots were established at points about ten miles apart. Loading ballast consisted of small gravel packed in stout bags to weigh 100 pounds. No vehicles propelled by internal combustion engines or electric motors entered the competition.

The vehicles which actually took part in the first competition were as follows:

Steam Lorry to carry two tons, the Liquid Fuel Engineering Co., Ltd., East Cowes; Thornycroft Steam Lorry to carry five tons, The Steam Carriage Wagon Co., Ltd., Cleiswick; a three-ton Steam Lorry by the same company; Leyland Steam Lorry to carry four tons, The Lancashire Steam Motor Co., Leyland.

The accompanying table (Table 1) gives a summary of facts affecting the cost of the motor vehicles in this test:

TABLE I

Summary of facts affecting the costs per net ton mile.

VEHICLE.	PRIME COST.	SPEED--MILES PER HOUR.		Load carried.	Ton miles of load per annum of 260 working days.	Time occupied in obtaining the desired working pressure.	FUEL CONSUMPTION.			WATER CONSUMPTION.		Motive power per ton mile of load.	Attendants per ton mile of load.	THIRTY-FIVE MILES PER DAY.	
		Actual running.	Commercial.				To raise steam.	Per vehicle mile.	Per ton mile of load.	Per vehicle mile.	Per ton mile of load.			Cost of operation per year.	Total cost per net ton.

Ton miles = Load carried X Distance traversed.
Commercial speed = In speed to be expected in regular operation does not include delays due to special conditions.

The results of this trial indicate that a steam vehicle weighing from 5 to 9 tons including load of from 2.20 to 4.73 tons can be built for from \$1,800 to \$3,700, to run at a commercial speed of from 3 to 7 miles per hour for 35 miles per day at a total cost of from 4.80 to 10.50 cents per net ton per mile, or it will cost from \$1,850 to \$2,800 per year.

On Nov. 9, 1898, a motor vehicle competition was held in Boston, Mass., under the auspices of the Mechanics' Institute Fair, the results of this were of small importance and afforded little additional information.

During the year the Electric Vehicle Co., of New York City, placed in service 85 electric hansom cabs and broughams, which have been in constant operation with marked success. These have four 36-inch wheels provided with 5-inch rubber tires and weigh when complete 2,700 pounds. The steering is done by shifting a vertical lever, conveniently placed at the right hand side of the operator's seat, which in turn through a system of levers shifts the rear wheels.

The two motors are controlled by a small parallel controller placed under the cabman's seat, and are also operated by a lever at the left side of the seat. Two iron-clad self-oiling ball-bearing Lundell motors are mounted under the cab body upon the axle with a form of spring suspension. Each motor weighs 172½ pounds and is rated at 1½ horse power, with a speed of 1,350 revolutions per minute, taking current at from 88 to 120 volts.

The small pinions on the motor shafts mesh into gears with a reduction ratio of 8½ to 1, mounted upon each driving wheel. Current for operating the motor is supplied by 48 accumulator cells in a wooden box placed under the operator's seat. These weigh between 1,200 and 1,500 pounds. The battery has a capacity sufficient to run the cab 20 to 25 miles on an average. The controller provides three speeds; 4 to 5 miles at which rate the vehicle can run 25 miles; 7 to 9 miles, with a travel of 20 miles, and 15 miles with a travel of 13 miles. The complete cab costs about \$2,500, of which \$400 is chargeable to the battery. For service the usual city rate was at first charged; this has since been reduced to \$1 per hour or 30 cents per mile.

AUTO-TRUCK. See AUTOMOBILES.

AVELING, DR. EDWARD BIBBINS, British scientist and advocate of socialism, and son-in-law of the German socialist Karl Marx, died August 4, 1898. He was born of Irish parentage at Stoke-Newington, November 29, 1851. He held professorships in the departments of chemistry, physiology, and comparative anatomy in New College, Cambridge, and the London Hospital. Besides translating foreign works on socialism into English, Dr. Aveling wrote much to effect a wider and more definite popular knowledge of the works of Darwin and Marx. Mrs. Aveling (Eleanor Marx), known as a writer and speaker, committed suicide in May, 1898.

AZORES. A cluster of islands in the Atlantic ocean belonging to the kingdom of Portugal and having an area estimated at 1,005 sq. m., with a population in 1890 of 255,594. The chief town is Ponta Delgada in the island of San Miguel, with a population of 16,769, but the usual residence of the governor is at Angra, in the island of Terceira (pop. 11,067). The islands constitute a province of the kingdom of Portugal, returning deputies in proportion to the population.

AZTEC CLUB, founded in the City of Mexico in 1847, by officers of the U. S. army, with a view to cherishing the memories and keeping alive the traditions that cluster about the names of those officers who took part in the Mexican War. Associate members, sons or relatives, of the original members are nominated by them and will inherit the membership. President and Treasurer, Gen. Simon B. Buckner, Kentucky; Secretary, Gen. Horatio G. Gibson. Headquarters, Washington, D. C. Membership, 245.

BABYLONIA. See ARCHÆOLOGY (paragraph Babylonia).

BACCHYLIDES. Until the end of 1897, Bacchylides was little more than the name of the youngest of the nine poets whom the Alexandrian scholars reckoned the masters of Greek lyric verse. Born near the end of the sixth century on the island of Keos, a nephew of Simonides, a somewhat younger contemporary and rival of Pindar, praised for his grace and sweetness by the ancient critics, he yet passed so completely out of sight that only 107 verses were known from quotations, and these in such fragmentary form that the longest passage contained only twelve lines. Recently, however, there arrived at the British Museum from Egypt about two hundred fragments of a papyrus roll, which was recognized from the presence of lines already known as a portion of the works of the lost poet. As pieced together the roll measures 14 feet 9 inches, and contains 37 columns of writing, but its original length can hardly have been less than 17 feet, and may well have been much greater. It contains twenty poems of which six are practically complete, while of nine more a considerable portion has been preserved. In all 1,070 lines can be restored with certainty. Six poems are unique in Greek literature, and may be classed in general as hymns, though it is probable that among them are specimens of the pæan and dithyramb. The other fourteen are in honor of victors in the national games, in-

cluding three for Hiero of Syracuse. Two of the poems for Hiero and one for Pythias of Ægina celebrate victories for which Pindar also composed odes. As in Pindar all the longer poems contain some legend often but loosely connected with the main theme, and it is interesting to find that within eighty years of his fall the story of Croesus could be used to point a moral. One of the hymns contains the story of the descent of Theseus into the depths of the sea to prove his sonship to Poseidon, a legend hitherto unknown in literature, though preserved by Greek vase-painters. As a poet Bacchylides does not belie the statements of his ancient critics. Without the force and brilliancy of Pindar, he still shows genuine artistic power though restrained by the more conventional rules of his art. A true poet, if not a great poet, and a real addition to the world's literature, is the substance of the judgment pronounced by his first editor, Mr. Kenyon.

BACILLUS BOTULISMUS. A new bacillus has been discovered by E. van Ermengem, which, from being found in unboiled ham that had caused botulismus, or sausage poisoning, its discoverer has named the *Bacillus botulismus*. The ham had caused poisoning in 14 persons, all of whom were dangerously ill and 3 of whom died. A solution made by rubbing in water a piece of the ham was fed to rats, cats and mice without immediately fatal results, but proved rapidly fatal to guinea pigs and apes, even in small doses. Cats died in a few days. The poison proved as effective when the solution was filtered free of germs, showing that it is a toxin. When kept free from light and air it lasted in an active state many months. Warmth decomposed it rapidly. Microscopic examination showed many spores scattered through the meat, which proved to be those of a bacillus easily isolated in anaërobic cultures. The *Bacillus botulismus* is rod-shaped with spore formation at the end, resembling the Tetanus bacillus. As a rule it does not increase in the human body (though found in the spleen of one of the three patients who died) owing to the fact that it does not grow well in a temperature over 35 C. It has not been found in any quantity in experiments on animals. Van Ermengem reached the same results from experiments with a pure culture of the *Bacillus botulismus*, as with this ham and water solution. He is of the opinion that some of the reported cases of poisoning from flesh and from preserves may be due to this same bacillus. See *Zeitschrift für Hygiene u. Infektionskrankheiten*.

BACILLUS PRODIGIOSUS. See LEPROSY and SERUM THERAPY.

BACTERIOLOGY. See BACILLUS BOTULISMUS; DIPHTHERIA; EPIDEMIC INFLUENZA; HEATSTROKE; INDIA paragraph Plague; LEPROSY; SERUM THERAPY; SLEEPING SICKNESS; TUBERCULOSIS; TYPHOID FEVER; YELLOW FEVER.

BADEN, GRAND DUCHY OF. *Population, Religion, Education.*—The census of 1895 gave Baden a population of 1,725,464, an increase of 67,597 over the returns for the year 1890. The larger proportion of the population, namely 54.7 per cent., lived in communities with less than 2,000 inhabitants. The returns of the same census (1895) showed that about two-thirds of the population were Catholic. There were 1,057,417 Catholics, 635,392 Protestants, 6,592 of other Christian sects and 25,903 Jews. In the year 1894-5 there were in the public schools, gymnasia, and universities, 348,211 students and pupils.

Finance.—The expenditure according to the budget estimates for the year 1897 was 87,520,764 marks, and the revenue 81,506,803 marks. In 1897 Baden had no general debt but its debt on the railways was 335,172,885 marks. At the beginning of 1896 there were 1,024 miles of railway in the country, of which 871 belonged to the government.

Government.—The executive authority is vested in the grand duke, the title being hereditary in the eldest male line. Legislative authority is exercised by a parliament consisting of two chambers, namely the Upper Chamber which comprises the princes of the grand ducal house, and representatives of the nobility; the Lower Chamber, which consists of 63 representatives chosen for four years, twenty for the cities and 43 for the country districts. The reigning grand duke is Frederick I, who after a regency of four years assumed the title on September 5, 1856. His wife is the daughter of the Emperor William I of Prussia.

BADEN-POWELL, SIR GEORGE SMYTH, K. C. M. G., M. A., LL. D., F. R. S., a Member of Parliament, political economist, and authority on colonial affairs, died November 20, 1898. He was born in Oxford, England, December 24, 1847, and educated at St. Paul's, Marlborough, and at Balliol, Oxford. During the first year of his course in Balliol he published *New Homes for the Old Country*. In 1880 he went to the West Indies to investigate the results of the sugar bounty system, and two years later Mr. Gladstone appointed him a "joint special commissioner to report upon the administration revenues and expenditures of Great Britain's colonies in the West Indies." This report was considered to be a complete summary of West Indian affairs. He went to South Africa in 1885. It was here that he gained a reputation as an authority on colonial policy. In 1891 he served on the commission appointed to

investigate the Behring seal question and was a member of the joint commission that deliberated in Washington. He was a Conservative member of the House of Commons and represented the Kirkdale division of Liverpool from 1885 to the time of his death. He wrote extensively on subjects of colonial, financial, and scientific interest, *Absorption of Small States by Large, etc.*

BAHR-EL-GHAZAL, a Soudanese province belonging to Egypt until cut off from the latter's jurisdiction by the Mahdi's rebellion. It is watered by the affluents of Bahr-el-Ghazal and Bahr-el-Arab. It is a rich country, producing ivory, gum, rubber, and other products, and having, it is said, an abundance of timber. The natives are largely Zandebs, not negroes, but a copper-colored race with an occasional fair-haired type. Their origin is uncertain. They are said by a recent observer to be remarkable for their intelligence, trustworthiness, and self-respect. The province was controlled by Arabs until 1879 when Gordon established a government there on behalf of Egypt. The Mahdi's revolt cut off every communication with Egypt and in spite of the resistance of its administrator, Lupton Bey, it fell into the hands of the Mahdists. Attention was drawn to it in 1898 on account of the conflicting claims of France and England. It is a possession of great importance to the country that acquires it, for its population, which was estimated by Dr. Junker in 1883 at 1,500,000, is placed by a recent Belgian estimate at 2,000,000, and, owing to the fertility of the country as well as to the character of its inhabitants, its revenues are likely to be important and it affords a fine recruiting ground in the event of war. It lies to the east of the Ubangi district which belongs to France, and Major Marchand passed through it on his journey to Fashoda in March, 1898. It was said that France desired it as a recruiting ground for a native army in Central Africa and that from it as a base she would be able to command the upper Nile and ultimately Egypt. One of the grounds of the English claim was the belief that Egyptian sovereignty had never lapsed over this region. See the article EGYPT.

BALIZE. See BRITISH HONDURAS.

BALL, Rt. Hon. JOHN THOMAS, LL. D., D. C. L. (Oxon.), Lord Chancellor of Ireland, died March 17, 1898. He was born in Ireland in 1815, and was educated at Trinity College, Dublin. He became an Irish barrister in 1840 and Queen's Counsel in 1854. He was Vicar-General of the province of Armagh (1862); Queen's Advocate (1865); Solicitor-General for Ireland (1868); Attorney-General for Ireland (1868, 1874, 1875); Member of Parliament for Dublin University (1868-75); Lord-Chancellor of Ireland (1875-80). He published *The Reformed Church of Ireland and Historical Review of Legislative Systems in Ireland*.

BALKAN PENINSULA. The following table gives the area and estimated population of the different parts of the Balkan peninsula from the most recent statistics available in 1898:

	Area Sq. miles.	Population.
Immediate possessions of Turkey in Europe.....	62,744	5,711,000
Bulgaria (tributary principality).....	24,360	3,309,816
Eastern Roumelia (autonomous province).....	13,500	992,386
Novi-Bazar } Bosnia } Herzegovina }	23,577	1,568,092
Total Turkey in Europe.....	124,181	11,581,294
Servia (kingdom).....	19,050	2,314,153
Montenegro (principality).....	3,630	228,000
Total Balkan peninsula.....	146,861	14,123,447

See TURKEY, and the articles on the separate states.

BALTIMORE. The new charter secured by the city of Baltimore in 1898 resembles in many points the charter of Greater New York. The executive officer is the mayor whose term is four years, and who appoints all the principal officers, with the exception of one or two who are to be elected; but his appointments must be confirmed by the upper house of the city council. He has the power of removal. The city council consists of two houses, the members of the upper house holding office for four years, and the lower house for two years. The provision in the old charter that members of the upper house must own property assessed at \$500, and those of the lower house property assessed at \$300 is retained in a new instrument. The members of the allied departments constitute a joint board having advisory functions. A board of estimates almost exactly the same as that in Greater New York is established and the rules for the granting of franchises are modelled on those of New

York, but franchises are limited to twenty-five years instead of fifty years, as in New York, although the franchises may be renewed upon revaluation for another twenty-five years.

BALUCHISTAN, a country in the southern part of Central Asia with an estimated area of 130,000 sq. m., and an estimated population of 500,000. It includes Baluchistan proper, which is independent, being a confederation under the control of the Khan of Khelat; the districts of Quetta and Bolan, each administered by British officials acting for the Khan; seven assigned districts known as British Baluchistan and directly under British control; and finally certain territories belonging to Afghan or Baluch tribes. The capital is Khelat, but the chief city is Quetta. Owing to the uncertainty of the rainfall the country is not very productive. Camel grazing is an important occupation. Among the exports are wool, hides, madder, fruit and tobacco. Coal occurs in places. The Khan of Khelat receives a subsidy from the Indian government. In 1898 the Khan was Mir Mahmoud.

BALZAC, BODIN'S BUST OF. See SCULPTURE (paragraph Exhibitions).

BANGKOK. See SIAM.

BANFFY, BARON DESIDERIUS, Premier of Hungary, was born at Klausenburg, Hungary, in 1842. He was educated at the universities of Leipsic and Berlin. After leaving the latter university he travelled and then became an official in the Transylvanian Administration, and in 1875 became provincial prefect in Transylvania, where he was active in extending the spirit of Hungarian nationality. After service in the lower house he was elected, upon the reformation of the upper chamber, a life peer, and in 1892 was made President of the *Reichstag*; on the retirement of Dr. Wekerle in 1895, he was appointed Premier. Baron Banffy, who is a strong Liberal, assumed his present position with the understanding that Dr. Wekerle's policy should be carried out. In 1895 his dispute with Count Kalnoky brought about the latter's resignation, but the baron's attitude had the popular approval, as was seen from the general election in October, 1896. Late in November, 1898, it was announced that Banffy favored the continuation of the *status quo* in the lower house; the controversies ensuing precipitated numerous duels, no less than six arising from the action of M. Horansky, who called Banffy "a cheat and a traitor." In the duel between Horansky and the Premier, neither was injured.

BANK—BANKING. The efforts to secure a better system of banking in the United States continued during the year 1898 to be an important part of the currency reform movement. These efforts took shape in several important proposals in regard to the national banks as set forth by the Monetary Commission which grew out of the Indianapolis convention of 1896, by the Hon. Lyman J. Gage, Secretary of the Treasury, by Congressmen Walker and Fowler, and by President McKinley in his annual message of December 1897. For an account of the currency reform movement in general, and the details of some of the proposals that were made for the improvement of the national banking system, see the article CURRENCY REFORM. The various suggestions for reforming the currency, and in particular for devising a new banking system, were laid before the Committee on Banking and Currency in the House of Representatives, and this committee after deliberation prepared a measure which was proposed by Congressman McCleary on June 13, 1898, and known as the McCleary Bill. Its main provisions are discussed in the article on Currency Reform, but it is important to consider here some of the statements contained in the accompanying report. This report was one of the most notable documents in the recent literature on the currency question. The portion of it which relates to banking has an especial value and it may be of interest to summarize here some of its statements.

In the first place, it traces the historical development of banking and shows in an elementary way the social utility of the functions which the banks perform. Of these functions the most important is the extension of credit whereby the industrious and prudent members of society find means to anticipate their product and thus to carry on the work of production to a far greater extent than would be possible under other conditions. A bank is able to supply a credit basis for production by lending money to men known to be honest and capable and thus give them the means of employing a vast number of persons and of producing a great quantity of useful goods. The enormous extent to which production rests upon credit under present industrial conditions is too well known to need explanation. In so far as banks fulfil this office they perform one of the most necessary duties which justify their existence. The note-issuing function is less important in its influence upon production. Still, as a means of supplying a sound and elastic currency its value is unquestionable. The following figures show the relative importance of the different kinds of currency in performing the money work required to be done in the United States. The total volume of our circulation on January 1, 1898, was:

Gold coin and certificates.....	\$584,126,049
Silver coin and certificates.....	503,906,973
Government and demand notes.....	409,239,863
	<hr/>
National bank-notes.....	\$1,497,272,885
Deposits subject to check.....	\$223,827,755
	<hr/>
Total bank currency	\$3,434,563,513

From this it will appear that a far greater portion of the monetary transactions of the country are discharged by means of checks and that the sum of national bank-notes and the deposits subject to check is more than double the amount of the government currency. An attempt was made by the Comptroller of the Currency in 1896 to show the relative extent to which checks and the other forms of currency discharged performed the money function. He found that for every \$100 worth of business transacted through the banks the different forms of money were issued in the following proportions: gold 60c., silver 50c., greenbacks, silver certificates, treasury notes and national bank-notes \$6.30, bank checks, drafts, etc. \$92.50. This is enough to show the vast importance of the office which checks perform in the monetary work of the community, and besides the enormous saving of currency exchanges which they effect there is the vast work performed by the clearing houses, whose returns show that through them an exchange of property valued at \$50,000,000,000 is each year effected. In this estimate checks which do not pass through the clearing house are not counted and these are placed at some \$20,000,000,000 a year.

At first thoughts it appears a matter of surprise that the government should regulate the issue of bank-notes and at the same time allow checks to be issued without restriction. For the bank-note is after all of the same general character as a check. Each represents a demand obligation of the bank. Yet while the law puts no limit on the extent to which a bank may incur obligations through checks it does restrict the incurrence of such obligation through bank-notes. The explanation of this is the fact that the acceptance of a check implies a personal knowledge of the drawer. Within a certain circle checks may serve as well as and even better than bank-notes, but this circle is restricted to those who know something of each other's character and standing. Among these persons the interchange of checks is safer than the interchange of bank-notes on account of the ease of transmitting large amounts and the lesser liability to loss through misappropriation. But in dealing with strangers, checks are often useless. A more generally accepted currency is here needed and it has been found by experience that when subject to certain restrictions the banks can supply such a currency.

Why are these restrictions needed, it may be asked. The government does not limit the right of any one to circulate any number of personal notes that he chooses nor does it restrain a number of persons from uniting in the issuance of such notes and in circulating them as widely as they can. Why then should the government regulate the bank-note issues? The person who accepts them does so voluntarily. The answer is to be found in experience. Banks in certain circumstances have supplied a credit currency in response to the needs of trade and they have done this with perfect safety and with good results, effecting thereby a great saving to the community, both in convenience and in the amount of specie needed to carry on exchange. At the same time it has been observed that this useful function of the banks has been impaired under a system of free banking by the uncertainty of the individual as to the financial status of the bank—an uncertainty arising from the different degrees of honesty or efficiency with which the affairs of different banks have been managed. Under free banking, as it existed in the fifties, the condition of the bank currency was chaotic. A man who accepted a bank-note without previous knowledge of the financial status of the bank, did so at his peril. He was obliged in his own defense to watch the weekly and the daily bulletins showing the rating of all those banks whose currency was likely to fall into his hands in the course of trade. An element of speculation entered into the every day transactions of merchants who conducted their business by means of such a currency as this, and if there is one fact established by economics, it is that the undue dominance of luck or chance in business is to be deplored.

In view of these results of unregulated banking, it was proposed that by adopting some reasonable and consistent system the government should allow banks to perform the note-issuing function and at the same time prevent the bad results which arose from an abuse of the privilege. In other words, it was recognized that bank-notes supplied a social need, but it was thought that by means of government regulation they could be better adapted to their purposes. As the former Secretary of the Treasury, Charles S. Fairchild, said before the Committee on Banking and Cur-

rency, "Therefore the government properly came in and devised a system by which they shall be issued, and then certified that they are issued under that system. So that a man who takes a note, if he knows how good the system is, can know how good the note is, and he does not have to stop and look further. He has to know one large thing instead of a vast number of smaller things."

The interference of the government in this matter rests upon the same ground as its assumption of the exclusive right of coinage. Banks could issue notes without government regulation and the acceptance or rejection of these notes could be left to the judgment of the individual. This has been tried. In the same way the owner of bullion could place on it his individual stamp, stating its weight and fineness, and then circulate it as currency in the community, whose individual members would have to determine for themselves the question of its actual value. This too has been tried. But in the one case as in the other experience has shown that uniformity and system will save more to the community by removing doubt and by promoting rapid exchange than will be lost through the expense of government supervision. The object of government supervision then is to do a service to the whole community by diminishing the amount of bullion and the number of bank-notes that are necessary to do its money work. By making the instruments of exchange better fitted for their office, it increases the rapidity of their circulation and thus diminishes the volume necessary to meet the demands of business.

These are some of the points of a general character brought up in the Committee's report which accompanied the currency measure. One of the special objects of this measure being to improve the existing banking system, the report contains a summary of the merits and defects of the national banks as at present constituted. This summary is a very clear and compact presentation of the main arguments which are urged by the advocates of this particular branch of currency reform. Of all that can be said in favor of our national banking system the most significant thing is this: Under it no one has ever lost a single dollar by having in his possession a national bank-note. These notes rest on perfect security and as a consequence are unhesitatingly accepted from one end of our country to the other. When this system is contrasted with the system of State banks as it existed before the war, the great significance of these facts is apparent. The notes issued by the State banks wholly lacked that uniformity and security which characterize the present system. The note issues of those banks varied widely in their character; some were good and others were worthless, according to the banking system that existed in the respective States. Now the notes of one bank are as good as those of another and this has been accomplished without granting a monopoly of the note-issuing power to any set of banks. A national bank may be organized in any part of the United States by any number of persons, not less than five, provided they gather capital to the amount of \$100,000 and in case of small towns of 6,000 inhabitants of \$50,000, and provided they satisfy the Comptroller of the Currency that they are fit persons to be intrusted with this privilege.

Now for the defects. As a condition precedent to its transaction of business a bank must purchase United States bonds to the value of 25 per cent. of its capital and deposit them with the United States Treasurer at Washington, whereupon it may receive an amount of notes equal to 90 per cent. of the par value of the bonds and not exceeding 90 per cent. of the capital of the bank. Besides this each national bank must maintain in the treasury for the redemption of its notes a fund in lawful money equal to 5 per cent. of its circulation. Thus the basis of note issues is the credit of the government. So far as one essential requirement is concerned, namely security, it is fully met by this system. It remains to be seen how far another requirement of any banking system is fulfilled. This is the requirement of elasticity or the responsive adaptation of bank currency to the needs of trade. The extent to which a bank may profit by issuing notes under this system at a time when government credit is high and bonds are selling at a premium can be seen by this illustration offered in the Committee's report: Supposing the market price of United States bonds bearing 4 per cent. interest is 120, a bank investing \$120,000 can purchase \$100,000 of these bonds, on the deposit of which with the United States treasury it can issue \$90,000 in circulating notes, that is, 90 per cent. of the face value of the bonds. The bank would also have to lay out \$4,500 in accordance with the requirement that it shall keep in the treasury a fund for the redemption of its notes equal to 5 per cent. of its circulation. Thus the bank would have at its disposal only the sum of \$85,500, although it had expended the sum of \$120,000. Its profits consist of the interest on the government bonds and of the interest on this \$85,500 of notes. It will be seen from this that if the current rate of interest in the money market is comparatively high it may be more profitable to the bank to invest its capital in other ways; although when the current rate of interest in the market is low, approximating that on government bonds, there may be a reasonable profit to the bank in the issuance of notes. If this is so, we should expect to see a comparatively large issue where the supply of loanable capital is considerable,

that is, where the interest is low, and on the other hand small issues where capital is in demand, namely where interest is high. This appears to be actually the case as a result of investigation made by the Comptroller of the Currency for the year 1897. Taking three typical New England States, he found that the minimum circulation of the 132 banks was \$3,650,625 and the actual circulation was \$10,036,585. In three Western States with 264 national banks, the amount of circulation that could be issued on the minimum deposits of government bonds was \$4,681,597, while the actual circulation was only \$5,518,237. In six Southern States with 102 national banks, the minimum circulation was \$2,273,400, while the actual circulation was \$2,568,317. Thus where there was an abundance of capital, as in the New England States, the circulation was nearly three times the required minimum, while in localities where capital was in demand there was a comparatively slight excess of the actual note issues over the minimum required. This is certainly a sign that the banks do not satisfactorily issue notes in response to the needs of the trade.

Another argument urged against the present banking system is that it does not supply notes in response to seasonal demands, and as an instance, it is cited that in the agricultural communities of the Southern and Western States the banks are utterly unable to meet the extraordinary demand for currency during the three or four months in which the crop is being removed. The crops, therefore, do not supply the means for their own transportation. The purchasers are obliged to go to the money centres to borrow funds and the competition brings up the rate of interest. It is also said that the bank-notes do not readily respond to emergency demands, and as an illustration of this the case of the New York banks in the summer of 1893 is cited. Their reserves sank to a point below the legal minimum during the period of stringency and at the same time the bank-note issues increased only about \$5,000,000. When the panic was over and there was a comparative abundance of currency, the bank-notes began to expand and in the succeeding autumn showed an excess of about \$32,000,000 over the amount in circulation on June 1. These are some of the evils which are said to be inherent in a bond-based currency like that issued by the national banks—a currency of which the state of the government credit rather than the condition of trade determines the amount. As an illustration of the way in which the volume of notes has altered with changes in the credit of the government, it may be said that after the close of the war when government credit was firmly established the amount of the bank-note circulation began to shrink, and that it fell from \$339,081,799 in 1873 to \$122,928,085 in 1890.

In view of these defects the Committee and other monetary reformers have set themselves the difficult task of remodelling the present system in such a way that the notes shall remain as perfectly secured and as universally accepted as at present, but that they shall at the same time be issued more readily in response to the general needs of trade, to local conditions, to seasonal demands, and to emergency demands. The various schemes which have been proposed for this purpose are discussed in a general way under Currency Reform (q. v.).

The amount of national bank-notes in circulation has considerably increased since the summer of 1893. On June 1, 1893, the total national bank-notes outstanding numbered 177,164,255. At the end of 1896 they numbered 235,398,890. During the next year they showed some slight decrease and this gradual decrease continued during the early part of the year 1898; but from April, 1898, when they amounted to 224,398,019, they gradually increased and on October 1, 1898, amounted to 235,356,950.

The following table from the report of the Comptroller of the Currency in 1898 shows the assets and liabilities of national banks and other banking institutions in the United States on July 14, 1898:

Items.	3,582 national banks.	5,903 other banks.	9,485 total banks.
Loans	\$2,151,757,655	\$2,480,874,360	\$4,632,632,015
United States bonds	285,356,900	179,328,943	464,685,843
Other bonds	250,689,375	1,125,561,379	1,376,250,754
Cash	492,882,724	194,913,450	687,796,174
Capital	622,016,745	370,073,788	992,090,533
Surplus and profits	332,971,643	399,766,497	732,738,140
Deposits	2,076,226,576	3,664,797,296	5,741,023,872
Total resources	3,977,675,445	4,631,328,357	8,609,003,802

For further statistics of the national banks in the United States, see the article UNITED STATES (paragraph National Banks).

BAPTISTS stand third in the U. S. with regard to numbers. I. and II. Regular (North and South), with 17,165 ministers, 28,935 churches, and 2,324,170 members; III. Colored 1,731,636 members; IV. Six Principle, with 14 ministers, 18 churches, and 937 members; V. Seventh Day, with 130 ministers, 111 churches, and

9,154 members; VI. Freewill, with 1,350 ministers, 1,571 churches, and 91,981 members; VII. Original Freewill, with 120 ministers, 167 churches, and 12,000 members; VIII. General, with 550 ministers, 575 churches, and 28,000 members; IX. Separate, with 91 ministers, 91 churches, and 6,235 members; X. United, with 25 ministers, 204 churches, and 13,209 members; XI. Baptist Church of Christ, with 80 ministers, 152 churches, and 8,254 members; XII. Primitive, with 2,130 ministers, 3,530 churches, and 126,000 members; and XIII. Old Two-Seed in the Spirit Predestinarian, with 300 ministers, 473 churches, and 12,851 members. In 1898 the total number of Baptists in the United States was 4,364,427. At the conference in Washington, D. C., November 23, 1898, the American Baptist Home Mission Society decided to evangelize in Cuba, Porto Rico, and possibly Hawaii, as did also the Southern Board. The American Baptist Publication Society will coöperate with both. Another new enterprise was the founding of an industrial school at Ongole in India, by Rev. J. E. Clough. The reception of Dr. W. N. Clarke's treatise on theology, published this year, and the meeting of the Baptist Congress in Buffalo in October, when many questions were discussed, seem to point to more liberal beliefs in the Baptist church. Colgate elected a President, Dr. George Merrill, of Newton, Mass., but the University of Rochester, Brown and the Southern Baptist Theological Seminary were at the close of 1898 still without presidents. The latest report of the Commissioner of Education shows the Baptists to have 51 institutions, with 713 professors, 6,939 students, and an endowment fund of \$13,611,224. The Free Baptists, or Freewill Baptists, also report progress. Their most notable event was the 30th triennial general conference at Ocean Park, Me. Missions was the chief subject discussed; and the Free Baptist Young People decided to send a missionary to Africa and to support two missionaries in India. The question of the Free Baptists of Nova Scotia and New Brunswick consolidating with the Free Baptists of Maine, was agitated. The theological institutions—Bates College, the New Hampton Institution, and the Ministers' Institute at Cobb Divinity School—report prosperity.

The Colored Baptists held a national convention at Kansas City, Mo., in September, 1898, in a church, recently completed at a cost of \$30,000. The value of their church property amounts to \$9,619,373. The contributions in 1898 were \$786,533, for church expenses, and \$111,995, for other purposes. Very great results were reported of the National Baptist Publishing Board at Nashville, Tenn., which published and handled 1,573,750 copies of periodicals and did \$19,426 worth of business. It aided mission stations in Africa. The foreign missionary work of the Colored Baptists shows a large increase. This year a mission was started in Cuba. The Western College at Macon, Mo., managed and supported by Colored Baptists, reported prosperity. There are 39 such institutions. The *National Baptist Magazine* was transformed from a quarterly to a monthly.

BAPTISTS, GERMAN. See DUNKARDS.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA, organized in 1891, represents all the Young People's Societies of the Baptist Churches in America and Canada. It holds annual meetings. Officers at the close of 1898: President, John H. Chapman, Chicago, Ill.; Vice-Presidents, R. H. Pitt, D. D., Richmond, Va., H. O. Rowlands, D. D., Lincoln, Neb., and A. E. Wall, Moncton, N. B.; Secretaries, Rev. E. E. Chivers, D. D.; Chicago, and Rev. H. W. Reed, La Crosse, Wis.; and Treasurer, Frank Moody, Milwaukee, Wis. Membership 225,000.

BARBADOES, the most easterly of the Caribbee Islands, is a British colony having an area of about 166 square miles (106,470 acres) and a population in 1896 of about 189,000. The principal town and capital is Bridgetown (pop. 21,000). The colony is administered by a governor, who in 1898 was Sir James Shaw Hay, K. C. M. G. He is assisted by an executive council and committee, a legislative council of nine members, and an assembly of twenty-four members, elected each year by popular vote. There are seven police magistrates and a Supreme Court. The island is the headquarters for European troops in the West Indies. About 100,000 acres are under cultivation and the staple product is sugar, there being 30,000 acres planted with it, and 441 sugar works, and 12 rum distilleries. The sugar yield has been, in 1894, 66,262 hhds.; 1895, 36,461 hhds.; 1896, 49,399 hhds. Manjak is exported. About 900 persons are engaged in fishing, the value of the annual catch being about \$82,800. The registered shipping of 1896 amounted to 7,814 tons net. There are twenty-four miles of railway and 470 miles of wagon roads in the island. There are private telephone lines of 600 miles and a telegraph line of twenty-four miles. Both the telegraph and the railway are subsidized by the government, the latter \$29,200 annually. The Colonial Savings Bank has a paid up capital of \$2,922,000.

BARBER SHOPS are believed to be the frequent means of spreading diseases from customer to customer, notably syphilis and other diseases of the skin and scalp. The Board of Health of the Province of Quebec, at a meeting held June 17, 1898, approved instructions for the hygiene of barber shops, the principal points of

which are as follows: Each regular customer should have his own razor, soap, brush and comb. Instruments used in common should be disinfected by the barber after being used. Powder puffs should be replaced by a ball of cotton wool and alum sticks by small alum tablets, each to be thrown away or destroyed immediately after using. Sponges should never be employed, and if a common vaseline pot is used the vaseline should be removed by a spatula and care taken not to let this come directly in contact with the hands of the barber. The barber should carefully wash his hands and cleanse his finger nails before passing from one customer to another.

BARING-GOULD, SABINE, English author and clergyman, born in Exeter, January 28, 1834. On the death of his father he inherited the family estate of 3,000 acres. His list of publications is enormous, including essays, sermons, and novels. His last novel is *Domitia* (1898). In 1898 his opera *The Red Spider* was performed.

BARLEY. The following table published by the Department of Agriculture shows the acreage, production and value of barley in the United States, in 1898:

States and Territories.	Acres.	Production. Bushels.	Value.

BARNARDO'S HOMES. These institutions, founded by Dr. Barnardo in 1866, are homes for orphan waifs. The principle upon which they are conducted is the admission of all destitute children of either sex whatever be their creed, nationality, age, or physical defects. The first one was established in a small house in Stepney Causeway, but the number of applications for admission was so extensive that new institutions were opened in rapid succession, and in 1898 it was reported that there were eighty-six of these homes, of which seventeen were in the English counties, four in Canada, one in Jersey, and the others in London. There is a large village home at Ilford, Essex, containing about one thousand inmates. About fifteen hundred children are boarded out in the rural districts. Industrial training is given and efforts are made to secure employment for those who have received instruction. An emigration agency is maintained and a large number of the children emigrate to the colonies, especially to Canada, where there are so-called distributing homes and an industrial farm. Down to 1898, it was estimated that about ten thousand children had secured situations and that 98 per cent. of these had succeeded in their employment. It was also stated that as many as 36,000 young people had passed through the homes. The headquarters are 18-26 Stepney Causeway, London, E.

BARON DE HIRSCH FUND. organized in 1889, for the benefit of the Russian-Roumanian emigrants. It teaches them to become good citizens, holds day and night schools, where the attendance is 900, and supports a trade school on 64th street, New York, near Second avenue. President, Myer S. Isaacs; Treasurer, Emanuel Lehman; and A. S. Solomons, General Agent. Headquarters, 45 Broadway, New York. See **JEWS**.

BARRES, MAURICE. See **FRENCH LITERATURE** (paragraph Fiction).

BARRIOS, JOSE MARIA REYNA, President of Guatemala, was assassinated February 8, 1898. He was born at San Marcos, Guatemala, in 1855; was educated abroad; and when only thirteen years of age was among the volunteers led by his uncle, Justo Rufino Barrios, who were attempting to overthrow the government of President Carna. He was connected with subsequent assaults upon the "tyrannical" government, and was promoted in military rank for services rendered in various battles, including Retalhuleu, San Lucas, and Tierra Blanca. He held high rank in the army under the presidency of his uncle, after whose death in 1885 the National Assembly raised him to the grade of division general. He soon after became minister of war and then vice-president, and on March 15, 1892, was elected to the presidency. His term of office would have legally expired in March, 1898, but owing to the internal disturbances of Guatemala he had practically become a dictator. See **GUATEMALA**.

BARTLETT. SAMUEL COLCORD, D. D., LL. D., ex-President of Dartmouth College, died at Hanover, New Hampshire, November 16, 1898. He was born at Salisbury, N. H., November 25, 1817, prepared for college at Pinkerton Academy, Derry, N. H., and was graduated at Dartmouth in 1836. For two years he was principal of the Caledonia County Grammar School in Peacham, Vermont, and then (1838) became an instructor at Dartmouth. In the following year he entered Andover Theological Seminary, at which he was graduated in 1842; he was ordained in 1843 and became pastor of the Congregational Church at Monson, Massachusetts, where he remained until 1846. At this time he became professor of moral and intellectual philosophy and rhetoric at the Western Reserve College; he resigned this position in 1852 to assume the pastorate of the Franklin Street Congregational Church in Manchester, N. H. He remained here until 1857, and for the next two years was pastor of the New England Church in Chicago. In 1858 he became professor of biblical literature in the Chicago Theological Seminary, which opened at that time; though he kept up his work as an occasional preacher, as assistant in the organizing of new churches, and as associate editor of various religious papers, he remained in the seminary for nineteen years, when he accepted a call in 1877 to succeed Asa Dodge Smith, D. D., LL. D., as president of Dartmouth. While connected with the seminary he passed many months travelling in Europe, Palestine, and Egypt, and in 1874 he crossed the desert of El Tih for the purpose of studying in detail the conditions of the region which is supposed to be the scene of the wanderings of Israel. When he came to Dartmouth he did not find the college in a flourishing condition, but under his administration improvement was quite apparent. On account of opposition on the part of many of the alumni, Dr. Bartlett resigned from his position as president in 1892 and was succeeded by the present incumbent, William Jewett Tucker, D. D., LL. D. Dr. Bartlett was always interested in biblical and literary subjects; besides frequent contributions to the magazines and to religious papers, he published *Life and Death Eternal, A Refutation of the Doctrines of Annihilation* (1866); *Sketches of the Missions of the American Board* (1872); *Future Punishment* (1875); *From Egypt to Palestine, Observations of a Journey* (1879); *Sources of the History of the Pentateuch* (1883); *Veracity of the Pentateuch* (1897). At the time of his death he had been for thirty-seven years a member of the American Board of Commissioners

for Foreign Missions, fifteen years president of the New Hampshire Home Missionary Society, and often a member of the national council of Congregational churches.

BARTON, CLARA. See RED CROSS.

BASE BALL. The public interest in base ball showed a falling off in 1898, owing partly to the excitement arising from the war, and partly to the disreputable character imparted to many of the games by the rowdyism of the players. In the championship campaign the "Bostons" won the pennant. The following table shows the number of games won and lost by the members of the League, together with the percentage of victories:

Clubs.	PENNANT RACE RECORD FOR 1898.		Percent-
	Won.	Lost.	age of Vic'r's.
Boston	102	47	.685
Baltimore	96	53	.644
Cincinnati	92	60	.601
Chicago	85	65	.567
Cleveland	81	68	.544
Philadelphia	78	71	.523
New York	77	73	.513
Pittsburg	72	76	.486
Louisville ..	70	81	.464
Brooklyn	54	91	.372
Washington	51	101	.336
St. Louis	39	111	.260

In the amateur field the record of Harvard, Princeton, and Yale was as follows: Yale, 4 victories; Princeton, 3; Harvard, 1. In the Inter-Collegiate Association, comprising Dartmouth, Williams, and Amherst, the championship was won by Dartmouth, Williams standing second, and Amherst third.

BASUTOLAND lies to the northeast of Cape Colony and consists of a well-watered tract of 10,293 square miles and a population estimated in 1895 at 250,000. The capital is Maseru with a population of 862, including about 100 Europeans. The exports are for the most part grain, cattle and wool. The mineral resources are as yet undeveloped but are said to include iron, copper and coal. Mines of the last named mineral are worked for the local supply. The roads of the country have been improved and extended in recent years. The work of education has gone on actively and the revenues have shown a slight but steady increase since 1891. There is postal communication with Cape Colony and the Orange Free State and telegraphic communication with the former. Basutoland is under the government of a resident commissioner subject to the High Commissioner for South Africa. The Resident Commissioner in 1898 was Sir G. Y. Lagden. In 1871 Basutoland was annexed to Cape Colony but became a crown colony in March 1884.

BATCHELLER SYSTEM OF PNEUMATIC DESPATCH. See PNEUMATIC DESPATCH.

BATES, GENERAL ERASTUS NEWTON, first United States Senator from Minnesota, died at Minneapolis, May 30, 1898. He was born in 1828 at Plainfield, Massachusetts, and in early life went to Ohio; in 1855 he removed to Minneapolis, where he remained until shortly before the war, when he went to Springfield, Illinois, and there enlisted with the Eightieth Illinois Volunteers. He was advanced rapidly for meritorious services, holding at the close of the war the rank of brigadier-general. He and his command were captured and imprisoned at Andersonville and Libby, and he was not exchanged until the end of the war. For two terms he was State Treasurer of Illinois and later, on account of ill health, declined the Democratic nomination for Governor of the State. He was one of the framers of the charter of Minnesota, a member of the higher branch of its legislature, and its first Senator at Washington.

BATHS. See MUNICIPAL BATHS.

BAVARIA. *Population and Religion.*—According to the census of 1895 the population of Bavaria was 5,818,544 of whom 35.5 per cent. lived in towns of 2,000 inhabitants and over. The emigration from Bavaria has been considerable, though it has fallen off since 1892. By far the greater portion of the inhabitants belong to the Roman Catholic Church, the religious division of the population showing on December 2, 1895, 4,112,623 Roman Catholics, 1,640,133 Protestants and 53,750 Jews.

Production.—The principal grain crops are wheat, rye, barley and oats. Fruits, vegetables and tobacco are also produced. The vine is cultivated to some extent and in 1896 1,288,578 hectoliters of wine were produced, a considerable increase over the product of 1890. The brewing of beer is a very important industry in Bavaria,

the quantity manufactured in 1896 being 16,198,126 hectoliters. The production of hops is carried on extensively. Manufactures are not very highly developed, but there are signs of progress. The exportation of glass to the United States has increased in recent years. Bavarian trade in general with the United States has increased as appears from the report of the American consul under date of January 31, 1898, which shows an increase of \$26,390 in the value of the exports from Fürth, Bavaria, to the United States during the month of January 1898, as compared with the corresponding month in 1897. There were 3,908 miles of railway in Bavaria in 1897, of which 3,335 belonged to the state.

Finance.—The most important sources of revenue to the state are the railways, post, telegraphs, mines, etc., indirect taxes, state domains, direct taxes, and fines, etc.; and the chief branches of expenditure are the cost of administration, the contribution to Imperial expenditure, and the service of the public debt. The public debt at the end of the year 1896 was \$1,418,443,185.

BAYARD, THOMAS FRANCIS, died at the home of his daughter, Mrs. Samuel D. Warren, in Dedham, Mass., September 28, 1898. His death had been expected daily for weeks, but his remarkable constitution and vitality deferred the end even beyond the hopes of the physicians. The funeral services were held October 1, in the old Swedish Church in Wilmington, Delaware, in which city he was born October 29, 1828.

As his elder brother intended to take up the law, young Bayard entered business, but when the brother died, he left the trade to become a law student, at the request of his parents, and having been admitted to the bar in 1851, began practice with his father, James Asheton Bayard, in Wilmington. In 1861 while both he and his father were firmly opposed to secession—Delaware was a slave State, it will be remembered—they were also opposed to coercion and vigorously denounced the war; it is seen now that the course they recommended was an impossible one, and it is thought the position Thomas Bayard took at that time was prejudicial to his later preferment. The Bayard family in Delaware, remotely descended from the Bayards of the fifteenth century in south-eastern France, may point with pride to the records of their ancestry in colonial times; and in the present century a national senatorship was almost hereditary with them, Thomas F. Bayard being the fifth United States Senator in the family. In 1869 his father, having already served in the Senate, was re-elected to serve out an unexpired term, and on the same day the legislature chose the son for the full term; thus the seat which James A. Bayard vacated on March 4, 1869, was immediately occupied by his son. Three successive times he was returned to the same seat, which he finally left in 1885 to enter President Cleveland's cabinet. With his election to the Senate came his recognition as one of the leaders of the Democratic party, which position he maintained until his retirement from public life in 1897. Three times he was considered for the presidency, and his failure to secure a nomination, at least in the second convention—that of 1880—was chiefly due to the fact that he came from a State which was not doubtful and which had only three electoral votes. In 1876, defeated by Samuel J. Tilden, he worked earnestly for the latter's election, and served on the commission which finally determined upon the successful candidate. He was defeated in the two succeeding presidential conventions by General Winfield Scott Hancock and Grover Cleveland respectively. Both politically and personally he was a close and true friend to Mr. Cleveland, whose Secretary of State he was from 1885 to 1889, and who made him first Ambassador at the Court of St. James from 1893 to 1897. During President Harrison's administration, Mr. Bayard resumed his practice of law in Wilmington.

In the Senate, Mr. Bayard was often on the losing side of public questions. His earnestness and sincerity were never doubted. By inheritance and education he was a believer to a great extent in the principle of States' rights, and it was due to this that after his death the rather extravagant statement was made of him that he lacked the ability "to grasp the meaning of the word nation." But his love for humanity, for peace, for amicable relations between the States was seen in his untiring efforts to heal the wounds and eradicate the antipathies occasioned by the Civil War. He was conservative, he had great respect for law, he was a "tower of strength on the side of honest money." He was opposed to the greenback movement and "his speeches against inflation in the issue of 1874, when a majority of both Houses of Congress sought to commit the government to the enlargement of an irredeemable and depreciated paper currency in time of peace, were exceedingly able. But for him the soft-money flood would have overwhelmed the Democracy far sooner than it did." His career as Secretary of State was able and sometimes even brilliant. It is interesting to note that despite his conservatism, despite his love for precedent and that which was well established, he was the pioneer of the American colonial idea in the Pacific. Just after his death a well-known journal said that "in 1885 and during part of 1886 the principal 'Jingo' and expansionist in the United States Government was Thomas Francis Bayard,

Democrat, of Delaware"—an interesting fact, since expansion was one of the foremost topics of discussion in 1898 and was generally championed by the Republican party. His career at the Court of St. James brought him more honors from the English than from his own countrymen. With the whole force of his strong personality and with all his grace and charm, he persistently strove to win the good will of Englishmen toward himself and his country. The speeches he made at this time were censured by many as being fulsome and unbecoming a patriotic American. In September 1895, English and American officials were roused to indignation by reason of a pamphlet, published by Lord Sackville, in which Ambassador Bayard was attacked for alleged discourtesies, when he was Secretary of State, to Lord Sackville, who was then the British Ambassador in this country. Mr. Bayard ignored the attack, which was unmerited and which reacted upon its author. On December 10 of the same year, Representative Barrett, of Massachusetts, introduced a resolution in Congress, demanding the impeachment of Mr. Bayard for statements made on the seventh of the preceding month in an address before the Edinburgh Philosophical Institution, since a part of the speech, it was said, could be "construed into an attack on the policy of protection." By amendment the resolution was made simply a call for investigation and report. Representative Barrett introduced a similar resolution in regard to Mr. Bayard's speech at Boston, England, on August 2, 1895, and Representative McCall, of Massachusetts, subsequently introduced one requesting the President to report what measures he had instituted for the conclusion of the matter. The resolutions were referred to the Committee on Foreign Affairs and were never noticed by the administration. In 1897 Mr. Bayard made a speech in London which called forth a rebuke from Mr. Richard Olney, Secretary of State. In England he stood very high in both popular and official regard, and however unpleasant his speeches may at the time have been for Americans, it is doubtless true that his influence had much to do in bringing about that era of good feeling and fraternalism among Anglo-Saxons, of which there was so much discussion in 1898.

The character of Mr. Bayard, both public and private, was beyond reproach; no word of scandal, corruption, or insincerity was ever truthfully spoken of him, and even his political opponents agree that his speeches in England were founded on love for his country and the belief that stronger sympathy on the part of the one nation with the other would be of great benefit to America. Mr. Bayard was an able speaker and a good scholar; he delivered many noteworthy addresses before various educational institutions, and received the degree of LL. D. from Harvard, and that of D. C. L. from Oxford and Cambridge. A man of great kindness, dignity, and courage, it was said of him, that like that Bayard of another age, he was a *chevalier sans peur et sans reproche*.

Mr. Bayard's domestic relations were of the happiest. In early life he was married to Miss Louisa Lee of Baltimore. They had twelve children. Mrs. Bayard died in 1885 and four years later Mr. Bayard married Miss Mary W. Clymer, of Washington.

BAYREUTH FESTIVALS. After the inauguration of the Festival Theatre under Wagner's direction in 1876, when *Der Ring des Nibelungen* was performed three times; it was closed until 1882, when *Parsifal* was first given. The Theatre again opened in 1883, and since Wagner's death in that year festivals have taken place in 1884, 1886, 1888, 1889, 1891, 1892, 1894, 1896, and 1897. *Parsifal* was given in 1882, 1883, 1884, 1886, 1888, 1889, 1891, 1892, 1894, and 1897. The Tetralogy of *Der Ring des Nibelungen* was given in 1876 and 1896; *Tristan und Isolde* in 1886, 1889, 1891, and 1892; *Die Meistersinger* in 1888, 1889, and 1892; *Tannhäuser* in 1891, 1892, and 1894; and *Lohengrin* in 1894. The next Festival will take place in the summer of 1899. Its programme is: *Der Ring des Nibelungen*, July 22, 28, August 14, and 19; *Die Meistersinger*, July 28, August 1, 4, 12, and 19; and *Parsifal*, July 29, 31, 5, 7, 8, 11, and August 20. See A. Lavignac's *Music Dramas of Richard Wagner* (New York, 1898).

BEARDSLEY. AUBREY, artist and writer, died of consumption at Mentone, France, March 16, 1898. He was born at Brighton, England, in 1874; was educated at Brighton Grammar School. In 1892 he began working for the *Pall Mall Magazine* and the *Pall Mall Budget* and subsequently was engaged by various publishers. He soon gained a wide reputation as a designer of striking and fantastic posters and book covers, and in 1893 was elected to membership in the New English Art Club. He published with illustrations *Bons Mots* (1892); *Malory's La Morte d'Arthur* (1893); Oscar Wilde's *Salome* (1894); *The Rape of the Lock* (1896); *An Album of Fifty Drawings* (1896). He was associated with *The Yellow Book*, for which he designed the covers and supplied many illustrations. He also contributed drawings to the *Savoy* and to *Le Courrier Français*. In 1895 he wrote and illustrated *The Story of Venus and Tannhäuser*, and in 1896, a novel entitled *Under the Hill*. Shortly before his death he was engaged upon an illustrated edition of Mlle. de Maupin.

BEHRING SEA DISPUTE. At the close of the year 1897 the Behring Sea difficulty again occupied the public attention. To understand the points at issue a brief review of the history of the controversy will perhaps be necessary. One of the chief inducements to the purchase of Alaska by the United States in 1867 was the great value of the seal fisheries which were the main sources of revenue in the territory. For many years after the purchase the revenue from the fisheries was very large. From 1870 to 1885 the annual catch was about 100,000 seals, but afterwards the number began to fall off owing to the intrusion of the Canadian fishermen, and in the year 1890 the Alaska Company took only 21,000 seals. For the statistics for 1898 see the article SEALING.

The home of the seals is on the Alaskan coast and their breeding place the Pribyloff Islands. The root of the international difficulty was in the fact that while both these places belong to the United States, the seals in passing from one to the other each year crossed a portion of the Behring Sea. While on their way to the Pribyloff islands they have been taken in large numbers by the Canadian fishermen, and many have been killed and have sunk below the surface before they could be taken. The destruction of the herd has thus been excessive. The United States government at length determined to put an end to this abuse, but according to international law the boatmen of foreign nations have a right to fish and hunt in all waters outside of the three-mile limit from the shore. The question was, Could the United States by any construction of international law regard the waters of the Behring Sea, traversed by the herd for the purpose of breeding, as under the exclusive jurisdiction of the United States government?

The United States took the view that this portion of the Behring Sea was not subject to the rule of international law which applied in general to the open sea, and it based this position on the Russian ukases of 1799 and 1821, the former claiming exclusive jurisdiction over the Behring Sea as far as latitude 55° north, and the latter extending this claim as far as 51° north. There was much discussion and a careful study of documentary evidence to answer the question whether Russia had really exercised these exclusive rights with the acquiescence of other nations. This, however, was but one part of the argument advanced by the United States, which has never claimed that all of the Behring Sea is to be regarded as *mare clausum*. The United States has urged in the first place that the seal is not a fish; secondly, that it lives on the coast of Alaska which incontestably belongs to the United States; and thirdly, that as the property of the United States it should receive protection in passing from one point to another even though the passage be through the open sea. Moreover, even in the case of fishing it is right to prevent the employment of such methods as are certain to result in the extermination of the fish. No nation which is able to defend its honor and dignity should permit injury to its property on the high seas, and it was urged that Great Britain had repeatedly acted on this principle in analogous cases. In 1887 the attempt was made to form a convention with Great Britain for the limitation of the time during which seals might be taken. It was pointed out that it was to the interest of Great Britain as well as to that of the United States that the herd should not be destroyed, for the sealskins were dressed and dyed in London. This attempt came to nothing on account of the opposition of the Canadian government. A second attempt was made in 1891 and at the same time arbitration was proposed. Great Britain consented to a *modus vivendi* for one year during which the wholesale slaughter of seals was to be checked, but at the expiration of this time she declined to renew the arrangement. Negotiations continued, however, and on March 29, 1892, the United States revived a treaty for submitting the matter to arbitration by a commission of seven members. Two of these members were to be appointed by the United States, two by Great Britain, one by France, one by Italy, and one by Sweden. It held its sessions in Paris and in 1893 the tribunal decided adversely to the claim of the United States to a property right in seals beyond the three-mile limit. No award, however, was granted in regard to illegal seizures of sealing fisheries by the United States. This matter was postponed with a recommendation that it be made the subject of several diplomatic negotiations. In 1896 a treaty was made for the settlement of the damage claims, which extended over a long period of time beginning with the seizure of the British vessels, *Caroline* and *Thornton*, August 1st, 1896. Arbitrators were appointed under the terms of this treaty, and on December 22, 1897, they rendered their award. The British claims amounted to \$850,000 and included not only the value of the vessels but the estimated value of the prospective catch. The amount awarded, however, was only \$473,151.26, which included merely the value of the vessels and their outfits and the interest on the amounts.

The regulations for the prevention of pelagic sealing framed in accordance with the award of the Paris tribunal of 1893 proved wholly ineffectual, and at a conference between British and American representatives at Washington in the autumn of 1897,

it was proposed by the Hon. J. W. Foster that England and the United States should agree upon a *modus vivendi* suspending the killing of seals for one year from December 1897. This request was refused by the Canadian government. Among the reasons assigned for the refusal were the fact that the fleet had made its preparations for sealing, and that the loss involved in giving up the proposed expeditions and disbanding the crews amounted to so much that it would be impossible to induce the Canadian parliament to vote a compensation. Moreover, Sir Wilfred Laurier declared that there was no immediate danger of an actual extermination of the herd. The United States government now shifted its policy, finding negotiation fruitless, and prohibited the killing of seals by American citizens, except persons connected with the North American Commercial Company. It prohibited also the importation of sealskins, raw, dressed, dyed or otherwise manufactured, unless accompanied by a certificate signed by a United States consul that the seals killed were not taken in waters of the Behring Sea and the Sea of Okhotsk. The design of this policy was to oblige Great Britain to enter into a treaty to prevent pelagic sealing by cutting off the market for the Canadian seals. Almost half of the seals caught have been purchased in the United States. The effect would naturally be also to injure the interests of those London houses engaged in the business of dying and dressing skins.

On June 14, 1898, the joint resolution appropriating \$473,151.26 to pay the award in the Behring Sea damage cases was passed by the United States Congress, thus bringing to a close one vexatious point of dispute in the sealing question, which had disturbed the two governments for about twelve years. This satisfactory adjustment was regarded as a gratifying result of the growing friendliness between the United States and Great Britain.

The question of the protection of the herd was still unsettled. The commission to whom the questions in regard to the sealing difficulty were referred in 1893, recognized the fact that the fur seal seemed threatened with destruction. But while the United States members of that commission held that the rapid diminution in the number of the seals was due to the wholesale slaughter of them, the British experts attributed it to the unscientific methods of killing them practised on the Pribyloff Islands: Great Britain has shown a willingness to consider plans for the preservation of the seals, but she had always refused to recognize the claim of the United States to exclusive rights in the matter. The commission decided in the first place, that although the United States had succeeded to all the rights of Russia in Alaska and in the islands and waters adjoining, this country had no exclusive jurisdiction over the Behring Sea beyond the usual three-mile limit from the coast. It was also decided that Great Britain had never recognized Russia's exclusive jurisdiction over the seal fisheries of Behring Sea beyond the usual limit. Another decision was that the United States had no right to the protection of a property in the seals frequenting its islands in the Behring Sea when the same are found outside of the ordinary three-mile limit. The commission next took up the general question of protection. In the first place, it laid down the rule that no sealing should ever be carried on within 60 geographical miles of the Pribyloff Islands. In the second place, it prescribed under what conditions sealing should be allowed within the Behring Sea outside of this zone and in a certain wide stretch of the North Pacific Ocean. The conditions limited the privilege of sealing to sailing vessels under special license and carrying a distinguishing flag. The season should be open only from August 1 to May 1, and nets, guns or explosives were not to be used in taking the seals. It was furthermore required that the number, sex, date and place of capture of the seals should be reported. Both the American members dissented from this rule as well as from the decision against the American claim to a right of protection over the seals frequenting the islands in the Behring sea beyond the three-mile limit. But the United States was of course bound by the award of the commission, which by the terms of the international agreement was to bind both governments until they should mutually agree to abolish or modify it. After five years it was subject to revision. The award settled once and for all the question of a property right in the seal at sea. The claim to such a right had been vigorously and ingeniously urged by the United States for many years. The arguments for it rested on humanity, self-defense and state necessity, while those against it were based on the premise that legally and historically the United States had no jurisdiction over the Behring Sea.

BELGIUM. The area of Belgium is placed at 11,373 square miles and its population on December 31, 1896, was 6,495,886 (according to a later estimate, 6,586,593). The former figures give it an average of 571.1 persons per square mile, making it one of the most densely populated countries in the world. The census returns of 1890 gave 2,485,072 as the number of Belgians who could speak French only, and 2,744,271 as the number who could speak Flemish only. Almost the entire population professes the Roman Catholic religion, the Protestants numbering 10,000 and the Jews about 4,000.

Coal Production.—On October 18, 1898, the American Consul at Brussels reported that the total amount of coal produced in Belgium during the year 1897 amounted to 21,492,446 tons, valued at \$42,589,715, and exceeding by 240,076 tons the production of 1896, which had been considered the largest ever realized in Belgium. Among the important facts which he reported in regard to the coal mining industry of 1897 was the decrease in the number of women and girls employed in the interior of the mines and also of the number of boys; and an increase in the average annual salary of the laborer of \$10.23 over that of 1896. It was also stated that there were 48 strikes in the various mining sections throughout the year, of which one was of considerable dimensions and only 4 were partially successful in so far as gaining an increase of wages had been the motive of the strikes.

Foreign Trade Policy.—There is no separate department in Belgium devoted to the interests of commerce and industry, but in one way or another these matters come under the control of the Minister of Industry and Labor, the Minister of Foreign Affairs, of Finance, of Agriculture and Public Works, and of Railways. As to specific measures adopted by the government for the promotion of trade it may be mentioned that neither in the matter of subsidizing the merchant marine nor in the promotion of technical education does the government actively interfere. It formerly granted subsidies to the merchant marine, but in 1898 the only line of vessels receiving a subsidy was the North German Lloyd. Two schools for the study of navigation are maintained by the government. But with these exceptions and the fact that it has made every effort to render Antwerp the most important port on the continent, it has left the development of trade to private enterprise. Technical and industrial schools have been established chiefly by private enterprise but in some cases by the municipal authorities. The foreign trade policy was protective from 1831 until 1855, after which changes were made resulting in the establishment of a tariff for revenue only, which system continued from 1861 until 1884. In that year the government laid an import duty upon cattle and meats and in 1896 a duty upon oats, butter, etc. Since the period of the most rapid development in Belgium coincides with that which followed the adoption of the tariff for revenue only, the supporters of the latter system have found a strong argument in its favor. Among the factors which have tended to promote foreign trade are the well organized chambers of commerce of the different cities.

Commerce.—In 1896 the general imports amounted to 3,037,371,700 francs and the general exports to 2,720,302,115 francs. In 1896 it exported to Germany goods to the value of 327,258,000 francs; to France 287,539,000 francs; to Great Britain 291,202,000 francs, and to the United States 48,912,000 francs. The value of its imports from these countries in the same year was from Germany 215,395,000 francs; from France 310,611,000 francs; from Great Britain 205,618,000 francs, and from the United States 173,650,000 francs. The chief articles of export were yarn, linen, wool, etc., coal and coke; textiles, raw; glass, etc.; and the general articles of import were cereals; textiles, raw; chemicals; timber; and mineral substances. The American Consul at Liège, writing under date of June 24, 1898, gave a summary of the commerce of Belgium for the year 1897. It seems that the commerce of Belgium for that year was three per cent. in excess of the commerce for the preceding year. The imports and exports in 1897 aggregated \$1,144,123,300, and besides this the trade in diamonds amounted to nearly \$22,000,000. The imports from the United States in 1897 showed an increase of 33 per cent. over the preceding year. They were valued in 1897 at \$44,718,100. The items which showed the greatest increase were grain, drugs, cotton, meats, oak and walnut woods, horses, vegetables and vegetable substances, resin and bitumens, and fruits. The imports from Belgium to the United States in 1897 increased 24 per cent. over the previous year. They amounted in 1897 to \$11,657,200. The items of the imports which showed the greatest increase in 1897 were caoutchouc, sugar (unrefined), skins, dyes, coals, linen and woollen goods, chemical products, fire-arms and rugs. The balance of trade between Belgium and the United States continued favorable to the United States, showing a considerable increase over the preceding year.

Early in 1898, an important institution was founded in Belgium for the furtherance of American and English commercial interests in that country. This was the Anglo-American Chamber of Commerce, to consist of Englishmen and citizens of the United States as well as all others who are interested in the trade between Belgium, England and the United States. Its seat is in Brussels, Belgium. A council of thirty members consisting of British subjects and United States citizens manages the affairs of this Chamber. Membership in the Chamber can be obtained by the payment of a moderate fee. One of its objects is to supply information in regard to the standing of firms, together with the names of firms engaged in particular trades. It also enables the British or American merchants to secure agents and representatives in Belgium by placing them in communication with firms or individuals of good standing who would be likely to form that connection with them. It supplies reliable information in regard to the condition of trade in Belgium and

gives notice of changes in the tariff and in customs regulations. It intervenes on behalf of its members when the latter claim to be unduly taxed, either by their home governments or by the government of Belgium. It places books of reference at the disposal of its members, renders legal opinions on matters affecting the commercial interests of the three countries and aids British and American merchants in taking part in trade exhibitions.

In 1898 an inquiry was made through the United States Consul into the condition of the lumber trade. The forests of Belgium are totally inadequate to supply the domestic demands and the importation of large supplies of lumber is necessary. These supplies have been drawn chiefly from Sweden and Norway, Russia and Germany. The trade of the United States with Belgium, though it had increased rapidly since 1893, was inferior to that of any of these countries but it was hoped that by a more careful adaptation of business methods to the usages of the Belgium importers the trade of the United States in lumber might be greatly advanced.

Labor and Industries.—An important event in the industrial history of Belgium was the appointment of an international convention on tariff and labor to be held at Antwerp in September 1898. In this international convention all who were interested either theoretically or practically in industrial affairs were invited to take part. The topics discussed included such matters as the effect of different tariff systems on the producer and the consumer, the suitable basis of tariff legislation, the value of treaties of commerce, and the effecting of improvements in the commercial statistics of foreign countries. The section devoted to the discussion of labor questions dealt with such subjects as the best form of trade unionism, the value of a systematic inspection of work, the question of legislation in regulation of the relations between employer and workman, and the effect of laws reducing hours of labor upon production and wages.

It was reported by the American Consul at Brussels in 1898, that there were signs of increased activity in nearly all of the Belgian industries in that year. The mining and metal-working industries and the manufacture of fire-arms and glass were all in good condition and giving steady employment to workingmen. There were strikes in the furniture industry in Malines, but the difficulty was adjusted without serious injury to the trade. The condition of the diamond-cutting industry was less fortunate, a serious and protracted strike having taken place.

Shipping, Post-office, and Telegraphs.—In 1896 the total tonnage of vessels entered and cleared in Belgian ports was 14,971,182. The working of the post-office in Belgium was in 1896 as follows: Private letters 110,566,990, printed matter 91,274,339, newspapers 101,513,576, postal cards 45,376,318, and official letters 20,597,401. On January 1, 1896, there were 864 post-offices and 1,002 telegraph offices. The total length of public telegraph lines was 3,955 miles, and the length of wires was 39,000 miles. In Belgium in 1898 important experiments were made in underground telegraphy. In 1896 the railway mileage open for traffic was 2,839.

Finance.—In 1898 the estimated ordinary revenue of Belgium was 388,298,598 francs and the estimated ordinary expenditure was 385,278,702 francs. In 1897 the national debt, which consisted of a share of the Netherlands debt at 2½ per cent., loans at 3 per cent., and a floating debt (treasury bonds), was 2,328,497,322 francs. See table following the article MONEY.

History.—Down to the year 1893 there were practically only two political parties in Belgium. These were the Clericals, or Catholics and the Liberals, or Anti-Catholics. But in the discussion of the revision of the Constitution during the years 1893 and 1894, there was a recasting of party lines resulting in the development of new groups. The Liberals divided into three groups, comprising first, the extremists, who were Socialists and formed the labor party; second, a more moderate but still advanced party known as the Progressists, and third, the rank and file of the Liberal party who adhered to their policy of the past. In the general election of October 1894 the Clericals secured a large majority over both the Liberals and Socialists, and in the summer of 1896 the Clerical gain was further augmented. The strength of the Clericals is greatest in the Flemish provinces, while that of the Socialists is greatest in the Walloon provinces. An interesting phase of recent party politics in Belgium is the language dispute. The Flemish tongue is spoken in the north, while the Walloons of the south speak French. The two languages merge on the borders into various dialects and, linguistically, the country is in a somewhat confused condition. The important question involved is what tongue shall be the official language. At present the official language, that is the parliamentary and legal language of the country, is French, but there has developed recently a strong nationalist Flemish party that demands the placing of Flemish on an equal footing with French as the official tongue. In the Parliament session of 1897, a bill was introduced for this purpose by Deputies Coremans and De Vriendt. The watchword of the party which they represented was "the Flemish tongue for Flanders." Agitation of the matter was stimulated by the growing racial pride of the Flemish, and the revival of interest in their national literature and history. The gains in the Clerical

majorities in recent elections marked the triumph of the Flemings over the political and religious liberalism which was generally characteristic of the Walloon element. Moreover, the Flemings in point of numbers are the strongest, being estimated at about three-fifths of the total inhabitants. They held that the free official use of their own tongue would place them on a fair footing with their rivals, the Walloons, who spoke French from their earliest years. They declaimed against the injustice of compelling a man to use a foreign tongue in the courts of his own country and to enforce his obedience to laws written in French. The question, however, did not involve racial antagonism on other grounds, for the Flemings freely admitted that the Walloons were as good Belgians as themselves. They did not pretend that a linguistic difference constituted a difference in national aims. Their arguments rested mainly on principles of abstract justice. The Walloons objected to the change on practical grounds. They held that the Flemish tongue which was spoken only in a small corner of the world would, if it became the official language of the country, isolate Belgium and impede her progress. French was the language of culture, of commerce and of politics. It was the language of international affairs, and to revert to the use of a tongue so little known, was a step backward. There were better reasons for a Fleming to learn French than for a Walloon to learn Flemish. The Walloons complained that the passage of the Coremans bill would place them in a position of inferiority. The bill passed the Chamber of Deputies and its supporters had high hopes that it would go through the Senate successfully. They were bent on its being passed as it stood, and declared that they would withdraw it if attempts were made to modify or amend it. Before the Senate voted upon it there was time for the opinion of the country at large to make itself heard. From centres of trade and learning there came protests from prominent men among both the Walloons and the Flemings. It was objected by the lawyers that the change would needlessly complicate legal affairs and a practical point was urged against it in the difficulty of translating the language of the laws into Flemish. Many of the Flemish themselves seemed to think that it would be injurious to the country and would sharpen the rivalry of the races. All sides of the question were brought out in the Senate debate and clause after clause was rejected. As the measure was finally passed all that was left of it was the provision that henceforth the laws should be published both in Flemish and French. Rather than accept such a small fraction of what they had originally demanded, the supporters of the measure withdrew it altogether.

Among the important questions discussed during the year 1898 was that of proportional representation. The *scrutin de liste* is said to result in injustice and in the election of candidates who represent but a small part of the voters. Many men of moderate views appear to favor the establishment of the new principle. But a measure looking to that end was rejected by Parliament. As a result of the general elections but little change was made in the character of the Chamber. The number of the Socialist deputation to Parliament was reduced from 29 to 28; the Clerical majority gained one vote and the Liberals remained the same as before. The Parliamentary session closed on May 6 and reopened on November 8. Among the important events of the year were the following: On April 11 the opening of a Socialist congress at Verviers; on April 14 a meeting of the congress of commercial education at Antwerp; on June 7 the meeting of an international congress on sugar at Brussels; on July 26 the meeting of an international congress on navigation at Brussels; on August 13 the establishment of a permanent commission for the examination of questions of international and private law at Brussels; on September 13 the meeting of the tariff and labor conference above mentioned; on September 28 the meeting of an international congress of art at Brussels; on October 1 the meeting at Antwerp of the international conference on maritime law; on November 15 the re-election of Beernaert as president of the House of Representatives; on December 25 meeting of the national congress of miners.

BELLAMY. EDWARD, American novelist and "nationalistic" writer, was born in Chicopee Falls, Massachusetts, March 26, 1850, and died at his home there May 22, 1898. After a partial course in Union College and a year of travel he was admitted to the bar in Hampden county, Mass., in 1871, but gave up his profession and until 1872 was an editorial writer for the New York *Evening Post*. He was an editor of the Springfield, Mass., *Union*, 1872-77, and in the latter year with his brother, C. J. Bellamy, started the Springfield *Daily News*. His works of fiction are *A Nantucket Idyl* (1878); *Dr. Heidenhoff's Process* (1880); *Miss Ludington's Sister* (1884); *Looking Backward* (1888). The socialism advocated in the last named work—which was very successful—was further developed by articles in the Boston *New Nation*, the editorship of which Mr. Bellamy assumed when he established the paper in December 1891. He also delivered many lectures on the same subject. In 1897 he published *Equality*, which is a careful amplification of the principles laid down in *Looking Backward*, and which, though widely read, did not attain the popularity of its famous predecessor.

BELOOCHISTAN or **BELUCHISTAN.** See **BALUCHISTAN.**

BEN HUR, TRIBE OF, a fraternal and benevolent organization founded in 1894, has 451 subordinate courts, 17,448 members, and a supreme temple at Crawfordsville, Ind. Since its organization it has disbursed \$217,450 and \$74,700 during its last fiscal year. D. W. Gerard, Crawfordsville, Supreme Chief; F. L. Snyder, Crawfordsville, Supreme Scribe.

BENNETT, EDMUND H., Dean of Boston University Law School, died January 2, 1898. He was born in Manchester, Vermont, April 3, 1824, was graduated at the University of Vermont in 1843, and in 1847 was admitted to the bar. He was judge of probate and insolvency for Bristol county, Massachusetts, from 1858 to 1883; mayor of Taunton, 1865-67; and lecturer at Harvard Law School 1865-71. In 1880 he became Dean of the Boston University Law School, which position he held at the time of his death.

BERMUDA, consisting of a group of numerous small islands (about 20 inhabited and 340 uninhabited) lying 580 miles east of the North Carolina coast; with an area of about 20 square miles and a population in 1896 of 15,952 (including 6,117 whites) is a British colony with representative government, having a governor, (Lieut. Gen. G. Digby Barker in 1898), an Executive Council appointed by the Crown, a Legislative Council also appointed by the Crown, and a House of Assembly chosen by electors and consisting of 36 members. A British garrison is stationed there. The chief town is Hamilton (pop. 1,296). The surface of the islands is remarkable for the fine scenery and the fertility of its soil. It is said that the ground often yields four crops of different vegetables within a year, but most of the farmers have not the skill and knowledge to make the most of this advantage. On the other hand the estates of the large planters are skillfully and effectively cultivated. The American Consul, in his report dated August 12, 1898, refers to an estate on which one acre planted in tomatoes yielded a crop worth \$1,500, and an acre of lilies yielded a return of \$1,800. All the chief exports go to the United States. These are onions, tomatoes, potatoes and lilies. In 1896 a parasitic disease attacked the lily plant and also seriously injured the crops of vegetables. The raising of fruit, which was formerly a most profitable industry, has been almost discarded, except in the case of bananas, on account of the disease to which the plants were subject. The estimated revenue for 1897-98 was £33,066 and the expenditure £38,089, the chief source of revenue being the customs. The public debt in 1896 was £46,600. In that year the exports amounted to £108,613, and the imports to £304,970. The Church of England is represented by over 10,600 members. The Bermudas are a favorite winter resort for Americans.

BERTILLON, ALPHONSE, the well-known anthropometrical expert, whose system, called the "Bertillon System" for the identification of criminals has been introduced in some of the States of the United States. He was born in Paris in 1853 and has written a number of works on anthropometry and the identification of criminals, including *Identification Anthropométrique* (1893). He is known also as an expert in hand-writing, although his method has been called into question by other experts. When the question of the identity of the *bordereau* with the hand-writing of Dreyfus arose, Bertillon maintained that Dreyfus had written the *bordereau*, although it was evident that he had tried to disguise his writing by changing it from hand-writing that slopes to the right, to a style that slopes to the left. His testimony at the Zola trial was said to be inconclusive, and Zola's counsel remarked at the conclusion with sarcastic emphasis, "And that is the man upon whose evidence Dreyfus was convicted." See FRANCE (paragraphs on History).

BESSEMER, SIR HENRY, English inventor, died in London March 14, 1898. He was born at Charlton, in Herts, England, January 13, 1813, and was chiefly self-instructed. His discovery of a rapid and cheap means of converting pig-iron into steel by forcing a blast of air through the iron when in fusion completely revolutionized the steel industry of the world in a period of about thirty years. His completed process cost him an immense amount of labor and expense, accompanied with many disheartening failures, but it is said that he realized from his patents \$5,000,000. At the time of his death it was stated that in Great Britain and the United States there was an annual output of 20,000,000 tons of steel, selling at an average price of less than \$25 a ton, while forty years before "the price was \$250 or more a ton, and the production was only a two-hundredth part of the present output." Mr. Bessemer was led to his discovery through his study of the manufacture of guns and projectiles. His inventions were not limited to the manufacture of steel, but included, among others, a perforated stamp for canceling checks, a kind of gold and bronze paint, steamboat designs, improvements in large telescopes, methods of electroplating with copper, processes of sugar-refining, and improvements on the centrifugal pump. A number of towns have been named after him, among which are Bessemer, Alabama, and Bessemer, Michigan. He was knighted in 1879; and was president of the Iron and Steel Institute of Great Britain.

BETTS, GEORGE FREDERICK, lawyer and soldier, was born in Newburg, New York,

June 14, 1827, and died in New York City January 18, 1898. After his graduation from Williams College in 1844, he attended the Harvard Law School and was admitted to the bar in 1848. During the Civil war Mr. Betts was lieutenant-colonel of the Ninth New York Volunteers. For nearly twenty-five years he was clerk of the United States District Court for the southern district of New York, of which his father was judge until 1878.

BIBLIOGRAPHICAL SOCIETY OF LONDON, 20 Hanover square, founded in 1892. In 1894 the membership was limited to 300. A. W. Pollard of the British Museum was appointed London Secretary and Ernest Dressel North, New York, the American Secretary. President, the Right Hon. the Earl of Crawford. Object, the study of bibliography, the founding of a library of bibliographical reference books, and the printing and publishing of books relating to bibliography.

BICYCLE PATHS. During 1898 the legislature of Massachusetts authorized cities and towns to lay out, construct and maintain bicycle paths. In Ohio, county commissioners were authorized to tax bicycles \$1 each a year and use the proceeds for bicycle paths. In New York, bicycle paths have been built in some counties under legislative authority and in that and some other States such paths have been constructed by wheelmen at private expense.

BICYCLING. In 1898 the world records in bicycling were broken in the case of the mile dash, which was reduced to 1 minute, 32 $\frac{3}{4}$ seconds on August 5, 1898; of the hour run, which was reduced to 34 miles, 1,220 yards on August 6; of the 100 miles run, which was reduced to 3 hours, 25 minutes, 53 $\frac{3}{4}$ seconds on August 30. The first two records were made in the United States and the last in England. A conspicuous event of the year was the six-day bicycle race held at Madison Square Garden, New York City, during the first week in December. Much comment was aroused in the newspapers by the extreme test which this contest imposed upon the participants. It was won by Charles W. Miller of Chicago, who covered 2,007 miles and 4 laps.

BILLIARDS. A championship game was played at Madison Square Garden on December 3, 1897. At this Jacob Schaefer of New York defeated Frank C. Ives, also of New York, Schaefer's points amounting to 500 and Ives's to 401. On December 4 George F. Slosson defeated Ives. The year 1898 was comparatively uneventful. Only two important professional matches were held and there was not much activity in the amateur field. An open tournament was held in Chicago beginning January 17, in which Ives and Schaefer tied for first place, the score being in each case three games won and one lost. The other contestants were Sutton, Catton and Spinks. Ives and Schaefer played a match balk-line game of billiards for the world's championship at Chicago on April 2, Ives winning by a score of 600 to 427. The former noted champion, Mr. William Sexton, died in New York April 25, 1898. He was famous for his match with the French champion, Maurice Vignaux, in 1876, at which, though he lost, it was evident that his skill was nearly equal to that of his well-known antagonist.

BILLOT, JEAN BAPTISTE, a French general, prominent in connection with the Dreyfus case, was Minister of War in the Méline Cabinet, and had previously held the same portfolio in 1882. It was he who in reply to questions in the Chamber of Deputies regarding the Dreyfus affair, said that on his soul and conscience as a soldier, he believed the judgment was well deserved, and that Dreyfus was guilty. He was charged by M. Clemenceau with having said in the course of a private conversation in the Senate, that if pressure was not brought to bear on the court, France would be involved in a revolution. He has a good record as a soldier, having fought in Algiers, Mexico, and the Franco-Prussian War. He was chosen Senator in 1875, and has been decorated with the grand cross of the Legion of Honor.

BIMETALLISM. Although the discussion of bimetallism continued actively during the year 1898, the events of that year were not on the whole propitious from the point of view of the bimetallist. In fact the single gold standard seemed more strongly entrenched throughout the world than ever before. By way of introduction to an account of the controversy of the standards during the year 1898, the following brief survey of the recent history and present status of the monetary systems of the world may be of interest. The last thirty years have seen a great change in the relation between the precious metals. Silver which for centuries had been on an equal footing with gold, has in most civilized nations been reduced to the rank of a token currency. At the present time Mexico is the only important state that adheres to silver as the standard of value. It is a currency with which she, as a great producer of silver, can supply herself cheaply and easily. Discrimination against it furthermore would be a discrimination against one of the most important of her native industries. Until recent years four great countries were ranged on the side of silver. These were the United States, India, Japan, and Russia. The placing of the United States in this list, however, is somewhat misleading. At the time when the act demonetizing silver was passed in 1873, that metal being at a premium was

practically obsolete as currency except as subsidiary coin. Nevertheless between the years 1878 and 1893 the United States Congress tried to improve the status of silver or maintain its existing parity with gold by means of enormous purchases of silver bullion. So far as it was hoped that this would maintain the market price of silver it was a failure. Under the Bland-Allison and Sherman acts 460,000,000 ounces of that metal were purchased. By a comparison between the price of silver at the time when it was bought under the provisions of these acts with its present market price, it will be found that the government lost by the operation about \$200,000,000. At last in 1893 the purchasing clause of the Sherman act was repealed and this country was placed definitely upon a gold basis. Then followed the period of reaction and uncertainty which was closed only by the defeat of the free silver candidate, Mr. Bryan, in 1896. Down to 1893 the United States was purchasing about one-third of the average silver production of the world. While these purchases did not prevent the steady depreciation of silver it can not be determined to what extent they hindered its depreciation from going further than it did. In the same year that the United States abandoned its policy of silver purchases, India, which had been buying about one-fourth of the silver production of the world, closed its mints to silver. Down to that time India had been a great ally of the cheaper metal; while silver was falling the Indian government was buying it on an increasing scale, the average annual import having risen from 23,000,000 ounces in the period from 1872 to 1885 to 53,500,000 ounces in 1890, and to a still higher figure in 1893. Naturally the withdrawal of these two great buyers from the market led to a further fall in the price of the white metal.

Next comes the defection of Japan and Russia. Japan had originally a silver standard, but after the war with China as a result of which she had been able to exact a large indemnity in gold, she demonetized the yen and set up the gold standard. In Russia the monetary difficulty arose from the existence of an inconvertible paper basis, from which she has lately been trying to escape by an accumulation of gold through borrowing, through the collection of her custom dues in gold and through the hoarding of the proceeds of her Siberian and other mines.

The causes of this monetary revolution are the debatable ground in the contests of bimetallists and monometallists. The weight attached to natural causes, such as the greater convenience of gold in making large payments, or the great increase in its production since 1850, will vary according as a man inclines to one or the other schools of thought. The bimetallists naturally attach more importance to secondary causes, such as the influence of Great Britain which, since the close of the seventeenth century has been moving towards a gold standard, and especially the action of the governments in closing their mints to silver. There is no doubt that this latter cause has had an important influence. The withdrawing of such powerful elements in the demand must of necessity have lowered the value of that metal. We should expect to find the closing of the mints to silver followed by a greater disparity between the market values of the two metals, and this very thing has happened. Naturally enough it is a matter of debate how far this disparity is to be attributed to the appreciation of gold and how far to the depreciation of silver. Much needless confusion results from an ambiguous use of terms and a failure to see the identity of a proposition when stated in a little different language. As compared with gold, silver seems to have fallen about 55 per cent.; whereas forty-five principal commodities, when compared with gold, have fallen off about 35 per cent. To what extent demonetization has caused this greater depreciation of silver relatively to gold than of commodities is a question that can only be answered theoretically.

The points of practical importance are that silver has been rejected by the governments of civilized nations as a standard of value and that whether as a consequence or not there has been a general falling of prices measured in gold. This falling of prices has taken place in spite of a great increase in the annual output of gold. The annual production which in 1873 was about \$100,000,000 rose to about \$250,000,000 in 1898. During the last seven years it is estimated by an English economist that the world has produced £257,000,000. The question is, What has become of all this gold and why has it not prevented the fall of prices? One answer may be found in the fact that about £157,000,000 of this gold was absorbed by the state banks of seven great European nations thus leaving only £100,000,000 to be taken by other banks and to find its way into the circulation. As to prices, the index number based on 45 important commodities was 70 in 1888 and about 65 in 1898. The demonetization of silver must have had some influence in bringing about this state of things although it is in part explained by other causes. For instance, Russia has been storing large supplies of gold in order to obtain a basis for her inconvertible paper. This has been necessary for the establishment of a sound currency but it has tended to lower prices. The monometallists do not expect that this condition will last. They look to a cessation of the strain imposed upon gold by the extraordinary demand in Russia and they think that a rise in prices will follow. Nor do they fear any falling

off in the output of gold. The bimetallists, on the other hand, can see no solution of the problem except in the remonetization of silver.

In 1898 there was considerable discussion over the monetary condition in India. The reason which led the government to close the mints there in 1893 was that the fall of exchange constantly imposed a burden on the government. For years, the falling market value of silver had increased the financial strain upon the government by requiring constantly larger amounts for the payment of the sterling debt. As a result of this burden there were deficits between 1885 and 1893 which had to be made up by taxation. For a short time previous to 1893 the value of the rupee remained nearly stationary, but in 1893 the old downward movement began again and it was decided to close the mint to silver. Contrary to what would naturally be supposed there has not been a contraction of the rupees resulting from the stoppage of the coinage. But though the actual amount of rupee currency has not diminished, a great change has taken place in respect to its distribution. The famine and military operations of 1896 and 1897 caused a drain on the commercial centres since the government spent large amounts of money in these famine districts and on the frontiers. The removal of currency from the commercial districts led to a monetary stringency which showed itself by a great increase in the rate of discount. Prices, however, did not fall but on the contrary actually have risen since 1893. After the demonetization of silver the government of India declared that it would give rupees for gold at the rate of 16d. per rupee. Since that time, however, the rupee has never reached that figure, although in 1897-98 it was 15.385d. How far this increase in 1897-98 is due to the famine or frontier operations and the borrowing of money, all of which would tend to create a scarcity in the money market in India, is an unsettled question. One of the proposals before the Indian Currency Committee in 1898 was that of Sir Edgar Vincent who advocated measures which should adapt or adjust the treasury balances to the needs of the market in such a way as to relieve the stringency during the busy season and increase the money demanded during the slack season. See INDIA (Currency).

In January, 1898, Senator Wolcott made a statement in regard to the work of the International Bimetallic Conference Commission. It will be remembered that this commission was appointed by President McKinley in 1897 to enlist the coöperation of other countries in bringing about a new international monetary convention and to propose measures to foreign governments looking to a wider use of silver as money. Senator Wolcott's speech gives an outline of this work. The commission was most favorably received in France, whose government promised cordial coöperation if an international convention should be called. In Great Britain the commissioners attempted to secure some concessions in favor of silver and for a time it seemed as if they would be successful. In the summer of 1897 the governor of the Bank of England declared that the bank would hold one-fifth of the bullion in the issue department in silver. This aroused a good deal of alarm among the English gold monometallists, and the subject was discussed with much earnestness in the press. The general tone of the comment was adverse to the action of the governor of the bank but after events seemed to indicate that the ministry desired merely to call forth an expression of public opinion in order that they might have something upon which to base their reply to the request of the American commissioners. This request of the commissioners, however, was of far less importance than that concerning the status of silver in India. It was proposed that the Indian mints should be opened to silver and that the order making the sovereign the legal tender in India should be repealed. The British government would give no answer to any of the proposals made by the commission until it had conferred with the Indian government. The latter submitted its decision on September 16, 1897. As might have been expected it was a distinct refusal of the request.

Since this reply of the Indian government shows clearly its attitude toward the question of the standards at the present time a summary of its contents may be of current interest. It first compared the currency systems of France and the United States with that of India and showed that while the first two of these countries each had the gold standard, India was still in a transition state for the silver rupee was there the sole legal coin, although the government had undertaken to receive gold and sovereigns under certain restrictions, the rate of exchange adopted being 16d. per rupee or 15 rupees to the pound. When the transition period was passed it was probable that the Indian mints would be opened to gold and gold coins would be made legal tender to an unlimited amount, but silver rupees would also continue to be a legal tender as at present. The essence of the American proposals was that while France and the United States should open their mints to the free coinage of both gold and silver at the ratio of $15\frac{1}{2}$ to 1, India was to open hers to silver and keep them closed to gold, the latter coin not being made legal tender. Thus France and the United States would be bimetallic and India monometallic (silver). By this it was hoped that a stable ratio would be secured, but in this

hope the Indian government could not share. The first effect of this change would be in its opinion the stoppage of the Indian export trade on account of the sudden rise in the rate of exchange for it was expected that the rupee would rise in consequence from 16d. to about 23d. if the ratio $15\frac{1}{2}$ to 1 were adopted. A long period of prostration would follow on account of the lack of confidence on the part of the people and should confidence not be restored a reversion to the present policy would be necessary and would result in an enormous loss necessitating additional taxation. The Indian government held that such a proposal affected India far more seriously than it did either the United States or France since the risk of disaster would fall practically upon India alone. Both France and the United States had considerable stocks of gold and when the danger of depletion threatened, each country would probably take measures to check the outflow of the more precious metal. It was not probable that they would be restricted wholly to a silver basis and the Indian government believed that no great change would take place in their monetary condition. India would thus have to bear the entire cost of failure. "We do not think that any remedy would be open to us for if the Indian mints were reopened to silver now, it would, in our opinion, be practically impossible for the government of India to close them again; and even if they were closed it would only be after very large additions were made to the amount of silver in circulation." India had already passed through a period of severe distress and could not afford to take any hazardous risks. If a monetary union was to succeed in establishing a stability in the relative value of gold and silver it must consist of nations with a sufficient amount of metallic currency to exert a very powerful influence upon the relation of the standards. Great Britain must certainly be a party to such a union to insure its success. The Indian government could not believe that success would result if only France, the United States, and India entered into the arrangement. The fear was expressed that the whole stock of gold coin might disappear from France and the United States before they had succeeded in raising the market price of silver to the intended ratio with gold. At all events such a result was conceivable. Nor did it seem likely that either of these countries would refrain from preventive measures in the event of a large exportation of gold, and the adoption of such measures would of course be inconsistent with the proposals of the union and would impair its prospects of success. Finally in addition to these objections to the general principle of the proposals the Indian government took especial exception to the extraordinarily high ratio, namely $15\frac{1}{2}$ to 1, a ratio which it said it would oppose as injurious to the interests of India even if it were possible that it could be maintained.

The other proposals made by the commission to Great Britain were that the legal tender limit of silver should be raised to, say ten pounds, that 20 shilling notes based on silver should be issued and should be legal tender; that an agreement should be made to coin a certain amount of silver each year; that the Indian mints should be opened to the coinage of rupees and to the coinage of British dollars to be full legal tender in the Strait Settlements and other silver standard colonies; and that other steps should be taken to promote the coinage of silver in the colonies. The British ministry refused all these requests, but did so in the most courteous manner possible giving the commissioners to understand that the question might be reopened whenever they considered that new circumstances justified it. The director of the mint in his annual report for the fiscal year ending June 30, 1898, makes the following comments on the work of the Wolcott International Bimetallic Commission:

"The theory that a fixed ratio between gold and silver could be maintained by an international agreement is based upon the assumption, scarcely to be contested, that the monetary use of these metals is a factor of their value. If an agreement should be reached between nations to coin only at a certain ratio and one metal should rise even slightly above that ratio it would pass out of monetary use entirely. The cessation of that demand upon the dearer metal, the redoubling of it upon the cheaper, would tend to bring them together again.

A single nation acting alone is certain to lose the dearer metal entirely and retain only the cheaper as its standard. Thus, for any country under present conditions to open its mints to the unrestricted coinage of both gold and silver at 16 to 1 or any thereabout ratio would be for it to lose what gold it possessed, because that metal would surely go where it was rated higher.

If, however, there was no country in the world where it was legally rated higher there would be no place in which it might go for monetary use. Allowing that the ratio originally agreed to was approximately the market ratio, the valuation thus coinciding with the judgment of the commercial world, there seems every reason to believe that such an international agreement would accomplish its purpose.

Even though one metal should become established in a value above the legal ratio and become merchandise, the currencies of all countries would retain their fixed relations to each other. No shock or distress would ensue, no nation would be iso-

lated or sacrificed. They would be altogether on a common plain, with a common measure of value."

In Senator Wolcott's speech in the Senate on January 17, 1898, he referred to the surprise felt by the commissioners as well as by a great many people in England at the rejection by the Indian government of the offer of the United States and France to coöperate with it in measures for the rehabilitation of silver. It had been expected that the stringency in the money market, as described in a preceding paragraph, would induce the Indian government to look upon these proposals with favor. In 1898 the attitude of the Indian government toward this matter remained unchanged. It was generally thought there that even supposing it had been a mistake to close the mints to silver in 1893, the government was definitively bound to this policy. The work now before it was to bring the gold standard into effective operation. In May 1898, the government appointed a committee to investigate the monetary system of India. Its Chairman was Hon. Sir Henry H. Fowler, and among its members were Lord Balfour, Sir John Muir, Sir Francis Mowatt, and other prominent men. Various plans were proposed to relieve the monetary stringency in India. Among them is the suggestion that the London government shall contribute a loan of £20,000,000 to constitute a gold reserve fund. For an account of important currency changes in Russia, see the article RUSSIA (paragraph Currency).

BIOLOGICAL STATIONS. See ZOOLOGICAL STATIONS.

BIOLOGY. Each succeeding year seems to find biology taking a more and more prominent place among the sciences and 1898 has been no exception to the rule, for the amount of literature devoted to biological problems has been greater than ever before and at meetings of scientists the questions of biology have been among the foremost in their discussions. It is so hard to limit strictly the field of biology that investigators in other fields have often been trespassers on its borders. Usually they have come from the neighboring fields of chemistry or physics but more recently, in addition to these the mathematicians have entered on the scene.

Heredity.—The most notable work of these new-comers has been that of Professor Karl Pearsons, entitled *Mathematical Contributions to the Theory of Evolution*, which was presented before the Royal Society of London and has been abstracted in many scientific journals. During 1898, he has published two of these Contributions, the first one being entitled *On the Law of Ancestral Heredity* and the second, *On the Reconstruction of the Stature of Prehistoric Races*. In the former he attempts to formulate a "rounded mathematical theory" of heredity, which he bases on Galton's law of "Ancestral Heredity." According to this law "the two parents contribute one-fourth, the four grandparents one-eighth, the eight great-grandparents one-sixteenth, and so on, of the total heritage of the average offspring." Starting from this law, Professor Pearsons maintains that "the whole theory of heredity becomes simple, luminous, and well in accordance with such quantitative measurements as have so far been made." He believes further that it will be borne out by the facts that are yet to be discovered and that the law of Ancestral Heredity will then "play as important a part in the theory of evolution as the law of gravitation has in planetary theory." In his second paper, he has for his object "to illustrate the general theory by which we may reconstruct from the knowledge of one organ in a fossil or prehistoric race the dimensions of other organs, when the correlation between organs of existing races of the same species has been ascertained. The particular illustration chosen is the reconstruction of probable stature from the measurements of the long bones." A number of races are dealt with and the stature estimated for many, savage as well as civilized, prehistoric as well as mediaeval and modern.

Vitalism.—The most notable contribution of the year to the discussion regarding the origin of life has undoubtedly been the address delivered by Professor Japp before the chemical section of the British Association at Bristol last August, entitled *Stereochemistry and Vitalism*. In this extremely interesting paper, Professor Japp not only supports Pasteur's position that "no one has ever transformed an inactive compound into a single active compound, while nature is continually doing it," but he goes further and says "No fortuitous concourse of atoms, even with all eternity for them to clash and combine in, could compass this feat of the formation of the first optically active organic compound. Coincidence is excluded, and every purely mechanical explanation of the phenomenon must necessarily fail. I see no escape from the conclusion that at the moment when life first arose, a directive force came into play—a force of precisely the same character as that which enables the intelligent operator by the exercise of his will, to select one crystallized enantiomorph and reject its asymmetric opposite." In one passage, the expression "not even conceivably capable" was used of the incapacity of dead matter to perform the geometrical feat which living matter is constantly performing. The address has aroused a great deal of discussion and this phrase has been so vigorously attacked that

Professor Japp has acknowledged that under certain extremely hypothetical and improbable conditions dead matter could "conceivably" perform the feat, but this does not affect the validity of the general argument. Coming at a time when physiologists are so prone to consider life as nothing more than a combination of physical and chemical forces, this strong plea for a more careful consideration of the problem will add greatly to the interest in the discussion of the question *whether there is such a thing as vital force*. See also ZOOLOGICAL LITERATURE (paragraph General Biology).

BISMARCK-SCHOENHAUSEN, OTTO EDOUARD LEOPOLD, PRINCE VON. On July 31, 1898, both Europe and America were surprised to learn of the death of Prince Bismarck, which occurred the previous evening at his castle in Friedrichsruh. Since October, 1897, he had suffered many changes for the worse, never entirely regaining the strength lost; but on Thursday, July 28, he seemed to be something like his former self again; he drank and smoked, and seemed so well that his old friend and physician, Dr. Schweninger, felt justified in leaving Friedrichsruh. Being summoned two days later he returned only to find the old statesman beyond help. His improved condition had continued up to Saturday noon, July 30, when a sudden change was noticed, and he passed away at eleven o'clock, the cause of death being acute œdema of the lungs. Emperor William, who at the time was in Bergen, Norway, being immediately informed, emphasized in his telegram to Prince Herbert Bismarck the lifelong friendship for Bismarck of his "grandfather now at rest in God, his majesty the great emperor, and also the imperishable gratitude of the whole German nation for all time." "I shall prepare," he continued, "the last resting-place for his remains in Berlin, in the cathedral by the side of my predecessors." But the man whom the young emperor eight years before had offended so deeply had prepared against the demonstrations of a state funeral, having left a written paper directing that there be but little ceremony at his funeral, and designating a place for his mausoleum near the castle at Friedrichsruh. The treatment he received from William II, he never forgave; his wounded pride as well as his dislike of ostentation may be discerned in the following extract from one of his later letters: "I will at least take precautions in good time against mischievous pranks being played with my dead body. I should not like to furnish what the Berliners call a 'beautiful corpse' in one of those theatrical tragi-comedies, something between a village fair and a church procession. It would be about the only thing that now has any terrors for me." About 600 people witnessed the funeral; the Emperor and Empress were not present, but having visited Friedrichsruh on August 2d to attend the private religious service held in anticipation of the funeral, they had gone thence to Potsdam, where the Emperor issued a proclamation expressing sorrow and sympathy both on his part and on that of the nation. He seemed anxious, indeed, to express his regard for the dead statesman; in a letter to the present imperial Chancellor, Prince Hohenlohe, he said: "We who were witnesses of his splendid labors, who looked up to him in admiration as a master of statescraft, as a fearless fighter in war or peace, as a most devoted son of the fatherland, and a most faithful servant of his Emperor and King, are deeply affected by the death of the man whom God the Lord fashioned as the instrument to achieve the realization of his undying aspiration for Germany's unity and greatness." A special memorial service, attended by the royal family and by men of highest rank from all parts of the empire, was held Thursday, August 4th, at the Emperor William Memorial Chapel, and three days later another, organized by the Berlin Bismarck Committee, occurred in the new Royal Opera House. Bismarck wrote his own epitaph, which some one called a "posthumous snub" for William II; besides his name and the date of his birth and death, are the simple words, "a faithful German servant of Emperor William I." That Bismarck wrote this with any of his old bitter irony is a conclusion which, while it is possible, does not seem to be necessary.

The death of Bismarck called forth a large amount of discussion, but the conclusion was very general that in him the world had lost one of the greatest statesmen in history. This honor, however, some have said must be denied him because of his failure to make principles of strict integrity essential in founding a state.

They point out also that in his wars with Denmark in 1861, with Austria in 1866, and with France in 1870, he had no statesman or general of the first rank to oppose him, while supporting him was von Moltke with the greatest fighting machine that the world had ever seen. M. Edouard Drumont declared Bismarck to be a "blood-stained pirate," while other opponents censure him for what they deem the unwise

PRINCE BISMARCK.

annexation of Alsace and Lorraine, and for the present European *status quo* with its burdensome armed peace. On the other hand the *Neueste Nachrichten* proudly styled him "the creator of modern Germany;" and it may be fairly said that public opinion both in Europe and in the English-speaking world, is agreed with certain able critics who said "he shares the century with Napoleon," "he stands with the greatest of the nation makers, with Cromwell and Napoleon and Cæsar, far above such politicians as the Metternichs, Cavour, and Gladstones." Bismarck's greatness lay in his firm mental grasp of the "situation"—the political trend,—in the readiness with which he transposed thought into action, and in the innate vitality and inflexible will by which he bore his purpose to fulfillment. His two chief characteristics have been said to be this stubbornness of purpose together with a disregard of the kind of methods used in effecting it.

The purpose of Bismarck's life to which he gave his best energies was the amalgamation of the German states into the German Empire with Prussia at its head. So much was written in 1898 concerning this life-work of Bismarck that it may be well here briefly to touch upon a few of the more salient points. His plans were of slow, steady growth, but as early as 1848, he showed that power of extraordinary foresight and prudence which afterwards became such well-known characteristics. In 1850 he thought that the advancement of Prussia could be affected by closer affiliation with Austria. Soon discovering, however, Austria's purely selfish policy, he concluded that hegemony for Prussia in a German confederation must come through Prussian effort. He saw that the time was not ripe for union, that the interests of the states were too diverse for successful amalgamation. Bismarck, moreover, then and always, was a staunch royalist, distrusting popular government, and believing, at that time at least, in the "divine right," and on this account also he opposed in 1849 a united German empire with the king of Prussia at the head, for he scorned the idea that "a Hohenzollern might accept the imperial crown of Germany from the hands of the Frankfurt parliament as an adequate compensation for the curtailment of his prerogatives as king of Prussia. . . . It was for Prussia to impose and not accept constitutions." It was chiefly by his advice both in 1848 and in 1850 that the king of Prussia refused to become emperor. Bismarck was at this time a minister. He soon began to seek political supremacy for Prussia by increasing the strength and prestige of her army, but on every hand attempts were made to thwart his plans. Contrary to an opinion that has obtained until recently, William I was not a resolute man, but was constantly persuaded and encouraged by the tactful Bismarck. When the latter became president of the ministry, he scorned the Prussian parliament and used for the army whatever funds were needed whether regular appropriations were made or not. "If we find it necessary," he said, "to go to war, we shall do so with your approval or without." By tact and artifice and every other resource of his dominating personality, he finally persuaded the king and the ministry into an alliance with Italy. This further estranged Prussia from Austria, and the latter finally met with defeat at the hands of the Prussians at the battle of Sadowa (Königgrätz); and Prussia at last triumphant and supreme accepted the cession of Schleswig-Holstein, Hanover, Frankfurt, and Hesse-Cassel. This victory of Prussia at Sadowa in 1866, some one has said, "made him all-powerful with his master and all-powerful with the Prussian people."

But the complete triumph of Bismarck's will, the final expression of his constructive ability, was not yet realized. A Franco-German war was necessary to establish that community of interest and feeling by which alone a true and permanent amalgamation of the North German and South German states could be effected. That the magic touch of Bismarck precipitated this war and caused to spring into life upon its blood and ashes the strong new German Empire, is a well-known chapter of recent history. Not so well known, however, until very recently has been the story of Bismarck's stratagem in "doctoring" the famous Ems telegram which tricked the French into declaring war. Before his death Bismarck admitted the truth of this report, the facts of which are substantially as follows: King William, who with Heinrich Abeken was at Ems, did not meet the French representative, Count Vincent Benedetti, with what Bismarck considered sufficient dignity and hauteur in their interview concerning the future candidacy of a Hohenzollern for the throne of Spain. On learning this Bismarck telegraphed peremptorily from Berlin that if the king received Benedetti again, he requested his dismissal; receiving no answer, he telegraphed again, stating that if the king had received Benedetti, it was equivalent to an acceptance of his resignation. Upon this Abeken sent the famous telegram of about two hundred words, the tone of which was so wanting in decision that, if published, it would have averted a declaration of war on the part of the French. Bismarck held a consultation with Roon and von Moltke, and, being assured that the army was ready for action, he reduced the telegram to about twenty words, so choosing and ordering them that the spirit of the message was changed to one of defiance, insult, and almost aggression. The abbreviated telegram, having been sent to the various

German embassies and published in the German papers, so incensed the French that, being ignorant of the close alliance which Bismarck had already effected between north and south Germany, in a few days they declared war. From the day of the coronation of the king of Prussia as the first German emperor "to the day of his dismissal, Bismarck was recognized as the ablest brain and the most masterful force in European politics." The mighty intellect, the unscrupulous methods, and the inflexible will had finally prevailed, and Germany arose a new creature.

Bismarck in his way was a pious man, being a firm believer not only in God and immortality, but in the idea that he was the instrument of God on earth. But he thought, or acted as if he thought, that his great object in seeking the advancement of the fatherland relieved him of scruples as to the manner of acting. Trickery, deception, and force he willingly used to effect his purposes, but he cannot be called base, for the accusation has not been made that he ever used unscrupulous methods for his personal benefit. In his public life—to use the expression of the ethicist—he minimized the importance of the *process* in considering the value of the expected *product*.

Bismarck had neither the broad knowledge, aside from politics and history, nor the thorough culture of his great contemporary Gladstone; but the world is quite agreed that the German excelled in constructive work and executive power. No man worthy of a hearing ever questioned the morality of one of Gladstone's public acts; but whatever the moralist may say of Bismarck, the chancellor's voice may still be heard triumphantly asserting that right or wrong he had the "saving virtue of success." He was not a great orator, yet his speeches were plain, clear, and forceful. He doubtless looked with some contempt on the more refined processes of rhetoric, and still he has left a large number of phrases and expressions that from their real suggestiveness and worth stick in the popular mind. Among them may be mentioned: "The majority has no heart;" "The more constitutional, the more expensive;" "Put Germany in the saddle and you will find it can ride" (*setzen wir Deutschland in den Sattel: es wird schon reiten können*); "Nach Canossa gehen wir nicht." "Do ut des."

The resignation of Bismarck in March 1890, from the offices of Prussian minister of foreign affairs, minister president, and imperial chancellor, started a discussion which has continued until the present time. The truth of the matter seems to be that the young emperor would not tolerate Bismarck's autocratic methods and at the same time differed essentially with him regarding both foreign and domestic policy. The immediate cause of rupture was the Berlin labor conference, which the emperor supported against the will of Bismarck. The trouble soon became so personal that the old statesman was forced to resign. While the public is not blind to the many able qualities of the emperor, still for accepting this resignation he has been greatly blamed. His dismissal was a bitter experience for Bismarck and Dr. Schweningen has stated that the old man called it his death-blow. The German Empire is his monument; all the world is asking, Will it abide? Since the advent of Prince Hohenlohe as chancellor, the policies of the "man of blood and iron" have suffered constant change, and meanwhile the mighty tide of German socialism is rising.

Busch's "Bismarck."—In the fall of 1898 Dr. Moritz Busch published his book entitled "*Bismarck, Some Secret Pages of His History. Being a Diary Kept by Moritz Busch During Twenty-Five Years' Official and Private Intercourse with the Great Chancellor.*" The book, which had been long expected, was favorably received as it threw much light not only on the private character of Prince Bismarck, but on many dark places in the political history of his time. The book is not, as Dr. Busch points out, either an autobiography or a biography of Bismarck. It is loose and unsystematic in its treatment, it aims at no one thing in particular, and is exactly what it is called, a diary of one man in which the words and actions of another are faithfully detailed. Throughout the work the character of the writer is subordinated and Bismarck is the all-powerful master spirit. Indeed, although the book is full of small talk and gossip, there are suggestions and revelations made which give one the impression of Bismarck guiding the events of his times like a god. Bismarck appears, as a critic has well said, more like a mighty force than a man. The notes for the book were taken and the book written with the full consent of the Chancellor, who wished that after he was dead the whole truth of his life should be revealed. And either we must believe that Bismarck was a very brave and candid man, or that his moral sense was too dull to perceive the shock that many of these revelations would give to the world, for the book seems to tell everything both good and bad. In it we see the mighty diplomat with his utilitarian standards his firm but crude religious beliefs, his entire lack of the aesthetic sense, his wit, his satire, and the vein of melancholy that on rare occasions made itself evident. The book emphasizes the feeling that has been increasing since his death that the man Bismarck was one of the greatest statesmen of all times, but that he also was one whose methods no self-respecting man could sanction. By this it is not

AT FRIEDRICHSDORF.

implied that stratagem and trickery in warfare and diplomacy are immoral, but it is meant that the extent, or rather the depths, to which Prince Bismarck carried stratagem and trickery, as is shown in this work of his friend, is immoral not to say despicable. And yet, we must never forget the great game in which Prince Bismarck played, and the magnitude of the stakes; and when we see what he did for Germany it may be that we can, in part at least, forgive him his methods.

Dr. Busch was associated with Bismarck from about the time of the Franco-Prussian war until the end of the Chancellor's life. He was a political newspaper writer and through him Bismarck published many articles, which at the time were not known to have been written by the Chancellor, but which, politically were very effective. Not only did Bismarck write many political articles, but for years he seems to have been the editor-in-chief of the whole German press. It seems that through bribery, intimidation, or otherwise, Bismarck subordinated the leading German newspapers to himself and used them to bring about his own political ends. We believe that Bismarck did this for what he thought was the real good of Germany, but the principle of the thing has brought upon him scathing words of rebuke. As an instance of his plotting it may be said that at the outbreak of the Austro-German war the Chancellor proposed to the Austrian general, according to Dr. Busch, that they negotiate a peace, unite their forces, and attack France. The book shows many such plots, and it is interesting to learn into what seemingly strange courses the German people were frequently on the point of being led.

In these "secret pages" Dr. Busch shows us Bismarck's dislike for England, its statesmen and its queen; in it are traced his troubles with the Empress Frederick, his influence upon William I, and many other things of great historical significance. From the book one learns that while Bismarck loved the old Emperor, he had no great respect for his judgment or his ability, indeed, when on one occasion he said: "I lack altogether the bump of veneration for my fellowmen," he included the old Emperor with the others. And yet, notwithstanding the determined purpose, the almost conscienceless methods of the "man of blood and iron," there were times, writes Busch when he had softer moments. "There is no doubt," said Bismarck, "that I have caused unhappiness to great numbers. But for me three great wars would not have taken place, 80,000 men would not have been killed, and would not now be mourned by parents, brothers, sisters and widows.... I have settled that with God, however. But I have had little, if any, pleasure from all that I have done, while, on the other hand, I have had a great deal of worry, and anxiety, and trouble." But Bismarck was rarely found in this mood and we cannot but believe that he did enjoy the vast processes of unbuilding and building again to which he devoted his life. While these "secret pages" were greeted by Bismarck's enemies as furnishing proof of the worst things which they cared to say of him, and while with this end in view it was published in serial by the *Paris Matin*, nevertheless the friends of the old Chancellor, and the fair minded student of history, see in the book what seems to be a trustworthy picture of what Dr. Busch well nigh proves to have been the mightiest political character of our times. See GERMAN LITERATURE (paragraph Biography).

BISMARCK ARCHIPELAGO, several island groups in the Pacific ocean north of the eastern portion of New Guinea and including what was formerly known as the New Britain Archipelago, together with several adjacent groups. They have an area of about 20,000 square miles with a population estimated at 188,000. They were acquired by Germany in 1884, when it extended a protectorate over them and re-named them as above. The exports consist chiefly of copra and cocoanut fibre. The commerce is largely controlled by the German New Guinea Company. The imports are estimated at about 1,000,000 marks annually.

BISMUTH. The use of the sub-nitrate of this salt has been recommended for the preservation of cider. It is used in the ratio of 150 grains to 200 quarts. It serves the double purpose of not limiting the alcoholic fermentation to any appreciable extent and at the same time of preventing the formation of acetic acid.

BISPHAM, DAVID S., American baritone, born in Philadelphia, Pa., January 5, 1857. of a Quaker family. He cultivated his voice in Italy and England and achieved a reputation as an amateur. His début was made as the Duc de Longueville in *The Basoche*, Royal English opera, London, in 1891; since then he has frequently appeared in America. Mr. Bispham sings German, French, and Italian, but he has achieved most success in the Wagnerian rôles of "Alberich," "Kurwenal," "Telramund," and "Wolfram." He has a special gift for making interesting programmes and much musical taste. Mr. Bispham lives in London.

BLACK, WILLIAM, English novelist, died December 10, 1898. He was born in Glasgow in 1841; after studying art at a government school, he persuaded himself that he had little talent in this direction and turned to journalism, removing to London in 1864; his education was desultory, but he seems to have gained much from the influence of nature in long ramblings through the Western Highlands. In

London he became connected with the *Morning Star*, acting as special correspondent during the war between Austria and Prussia, in 1866; subsequently he became editor of the *London Review*, then of the *Examiner*, and finally assistant editor of the *Daily News*. His first novel, *Love or Marriage*, was published in 1867, but his reputation was made by *A Daughter of Heth*, which appeared four years later. In 1875 he definitely left journalism for literature. Mr. Black's works achieved a merited popularity. In them, may be found a fresh and healthy sentiment and a high appreciation of nature. "An industrious writer, he left a long line of stories of varying interest and quality. His touch was light, his fancy graceful, his sentiment fresh. He did not deal with problems; nor did he touch the deeper psychology of life. His death removes a genial and kindly figure from contemporary English literature." The following is a list of his works: *Love or Marriage*, 1867; *Daughter of Heth*, 1871; *Strange Adventures of a Phaeton*, 1872; *Princess of Thule*, 1873; *Maid of Killeena*, 1874; *Three Feathers*, 1875; *Lady Silverdale's Sweetheart*, 1876; *Madcap Violet*, 1876; *Green Pastures and Picadilly*, 1877; *Macleod of Dare*, 1878; *White Wings*, 1880; *Sunrise*, 1881; *The Beautiful Wretch*, 1881; *Adventures in Thule*, 1883; *Yolande*, 1883; *Shandon Bells*, 1883; *Judith Shakespeare*, 1884; *White Heather*, 1885; *Wise Woman of Inverness*, 1885; *Sabina Zembra*, 1887; *Strange Adventures of a Houseboat*, 1888; *In Far Lochaber*, 1888; *Penance of John Logan*, 1889; *The New Prince Furtunatus*; *Stand Fast*, *Craig Royston*, 1890; *Donald Ross of Heimra*, 1891; *Wolfenberg*, 1892; *Magic Ink, and Other Tales*, 1893; *Handsome Humes*, 1893; *Highland Cousins*, 1894; *Briseis*, 1896.

BLANDIN, JOHN J., Lieutenant, U. S. N., officer of watch on the battleship *Maine* when that vessel was blown up in Havana harbor, February 15, 1898; died at Baltimore, Maryland, July 16, 1898. He was born in 1863; was graduated from the Naval Academy at Annapolis in 1882, and was aboard the *Trenton* at Apia, Samoa, in the hurricane of March, 1889.

BLEPHAROPLAST. See BOTANY (paragraphs Centrosomes and Blepharoplasts, Cytology, Spermatozoids in Gymnosperms).

BLIND, EDUCATION OF. See EDUCATION.

BLISS, CORNELIUS NEWTON, Secretary of the Interior in the McKinley cabinet, was born at Fall River, Massachusetts, January 26, 1833. He received his education at the public schools and academy of Fall River and at the high school in New Orleans. After leaving school he was for a year in the counting room of his stepfather in New Orleans, and then went to Boston where he was clerk in the firm of I. M. Beebe, Wright & Co. He became a partner in the Boston commission house J. S. and E. Wright & Co., in 1866. He afterwards went to New York to manage the business interests of the firm in that city, and in 1881 the house became Bliss, Fabyan & Co. Mr. Bliss became prominent in Republican politics in 1860. He was a member of the Pan-American conference; chairman of the Republican New York State committees, 1887 and 1888; treasurer of the national Republican committees in the campaign of 1892 and 1896. All other public office he declined. He was chairman of the business men's committee which sought to secure a second term nomination for President Arthur in 1884, and in 1893 was chairman of the "Committee of Thirty." On March 5, 1897, he was appointed and confirmed Secretary of the Interior in President McKinley's cabinet. He has been a strong opponent of Mr. T. C. Platt and the Republican machine in New York. In December 1898, Mr. Bliss resigned his portfolio. His successor is Mr. Ethan Allen Hitchcock, of Missouri, ex-Ambassador to Russia.

BLUESTONE. See BUILDING STONES.

B'NAI B'RITH, IMPROVED ORDER, a fraternal society, founded in 1887, with one supreme lodge, 35 subordinate lodges, and 3,472 members. Since its organization it has disbursed \$133,000 (endowments only) and \$24,000 the last fiscal year. Joel M. Marx, New York, supreme president; Rudolph Sachs, Baltimore, first vice-president; Sol. S. Schloss, Baltimore, second vice president; Leopold Braun, Baltimore, secretary; and Kaufman Katz, Baltimore, treasurer.

B'NAI B'RITH, INDEPENDENT ORDER OF, a fraternal organization founded in 1843. It has 10 grand lodges, 454 subordinate lodges, and 31,750 members. Altogether it has disbursed \$39,250,000, and \$1,243,000 during the last fiscal year. Julius Bien, New York, president; Simon Wolf, Washington, vice-president; Solomon Sulzberger, New York, secretary; and Jacob Furth, St. Louis, treasurer.

BOARDS OF HEALTH. See PUBLIC HEALTH; SANITARY LEGISLATION; SEWAGE PURIFICATION; and WATER PURIFICATION.

BOAT-RACING. At Henley in England the single scull race at the Henley Regatta was won by an American registered from Trinity Hall, Cambridge, England. In the United States the triangular race between Harvard, Yale and Cor-

nell Universities was held at New London, Conn., on June 23. The Cornell crew won easily, leaving the Yale crew 4 boat lengths behind and the Harvard crew, which was behind from the start, still farther in the rear. The race between the Freshmen crews was more interesting because more closely matched. Yale came out ahead with Harvard second and Cornell third. Cornell, which had been victorious at New London, was defeated by the University of Pennsylvania at Saratoga on July 2, Wisconsin and Columbia coming in third and fourth. The Cornell Freshmen crew won in the Freshmen race. The annual boat-race between Oxford and Cambridge was held at Putney on March 26, resulting in a victory for Oxford.

BOERS. See TRANSVAAL.

BOHEMIA, is a province of Austria with an area of 20,060 square miles and a population on December 31, 1890, of 5,843,094, of whom about two-thirds were Czechs and one-third Germans. It has a Provincial Diet which is competent to legislate on all matters not expressly under the jurisdiction of the *Reichsrath* and which consists of a single assembly. It is one of the most productive provinces of the Austro-Hungarian Empire and its trade is important. The United States Consular Report, dated January 12, 1898, gives the declared value of exports from the district of Prague in Bohemia to the United States as \$407,483 for the quarter ending December 31, 1897, as against \$446,100 for the quarter just preceding. The falling off is chiefly due to the cessation of the exportation of sugar. The sugar industry in Bohemia is one of the chief sources of wealth. At the beginning of 1898 there were 112 raw sugar factories, twelve factories with refineries and nine refineries in operation. The Austrian government pays a bonus to the producer and thus stimulates the industry. The chief market for sugar is England, which is said to take about 80 per cent., the rest going to Canada, India, China, Japan, and the Argentine Republic. The reason assigned for the cessation of the export of sugar to the United States was that the dealers had shipped a large surplus to this country just before the passage of the new United States tariff act, and had thus overstocked the market. The exports from the district of Prague, in Bohemia, to the United States continued to show a falling off during the first quarter of the year 1898, and this was no longer attributed to the sugar industry but to the tariff since those articles which showed the decrease were chiefly wool, hops, potash and dress goods.

Political Situation.—For thirty years Bohemia has been striving for more complete local independence. She has aimed to secure for herself such a position of virtual independence as Hungary obtained in 1867. Recently racial differences have thrown the province into confusion. The young Czech party has become more prominent and aggressive and the quarrel over the language question was very bitter in Bohemia during 1897-8. The Czechs demanded that the Bohemian tongue should be put on an equal footing with the German. The Bohemian party was strong enough in the *Reichsrath* to make the ministry dependent on it for its continuance. Count Badeni, the Premier, at last issued the famous language decrees demanding that government officials in Bohemia should learn to speak Bohemian and that the latter tongue should be used concurrently with German. This measure provoked the German element in the population to violent action. The antagonism was most apparent in the matters of education for in districts where the one element predominated it refused to allow the language of the other to be taught in the schools. It is provided by law that the language of instruction shall be that which prevails in the district. The fanatical spirit ran so high that each party did its best to prevent the language of the other from being taught or spoken. In Prague, for instance, German almost ceased for a time to be spoken and the German inscriptions on monuments were effaced. Race animosity became so bitter that German employers discharged their Czech laborers in great numbers and Czech shop-keepers refused to serve German customers. Each party was to blame but of the two the Germans were the more aggressive, having, as they thought, more to gain by agitation. For a further account of the race controversy, especially in regard to the disgraceful scenes to which it led in the *Reichsrath*, see the article AUSTRIA-HUNGARY.

BOISDEFFRE, LE MOUTON DE, the chief of the staff of the French army during the Dreyfus agitation. (See FRANCE, paragraphs on History.) He was born in 1839; studied at St. Cyr; served in the Franco-German War; became general of division in 1892, and chief of the general staff in 1894. He appeared in court in full uniform toward the close of the Zola trial, and declared in confirmation of the statement made by Gen. de Pellieux in regard to the existence of a third secret document, that there was such a document, and that it proved beyond a doubt the guilt of the convicted captain. His address to the jury was greeted with loud applause, and the angry criticism by Zola's counsel, M. Labori, caused an uproar in the court. Labori declared that generals of the army were coming into court in full uniform in order to influence the decision, and complained that while they were allowed to harangue the jury against revision, the defense was checked and thwarted in every way. The

document referred to by Gen. Boisdeffre was the third letter which was supposed to have passed between the German and Italian attachés, but which the confession of Lieutenant-Colonel Henry proved to be a forgery. After Henry's death, Gen. de Boisdeffre resigned, saying that he had mistakenly placed confidence in Lieutenant-Colonel Henry, and had believed as genuine what was proved to be forged evidence.

BOKHARA, is a tributary state of Russia lying in Central Asia to the south of the Russian province of Turkistan and to the north of Afghanistan. It is ruled over by an Ameer (Sayid Abdul Ahad in 1898). Among its products are cotton, corn, fruit, tobacco, silk, and hemp, and the raising of live stock is important. It is traversed by the Russian Trans-Caucasian railway which passes near the capital, Bokhara, and a telegraph line connects the latter city with Samarkand. Russian officers give military instruction in the army which the Ameer is allowed to retain for administrative purposes and which numbers about 20,000, and there is a Russian Political Resident at the court. The population is about 2,500,000 and the area 92,000 square miles. Bokhara, the capital, has about 100,000 inhabitants.

BOLIVIA, one of the two interior republics of South America, consists of nine departments, whose area aggregates about 567,360 square miles, and whose total population is estimated at 2,019,549. The aboriginal Indians number about 1,000,000, the mestizos (races of Spanish and Indian blood), and the whites, each 500,000. La Paz de Ayacucho is the department of greatest area (171,200 square miles) and of greatest population (593,779); the smallest department is Oruro (21,331 square miles), and the least populous, Beni (26,750); Cochabamba is the most densely populated (area, 21,417; population 360,220). The Litoral department on the coast is mortgaged to Chile, but Bolivia is guaranteed the privileges of a port. Sucre, the seat of government since 1894, has about 20,000 inhabitants; La Paz, the capital in 1893, has 40,000; Oruro, the capital in 1892, 15,000; the other more important towns are: Cochabamba, 25,000; Potosi, 20,000; Tarija, 10,000; Santa Cruz, 10,000.

Government.—According to the present constitution, the chief executive authority is a President, who is elected by popular vote for a term of four years, and who is ineligible for reelection. He is assisted by a ministry of five departments designated as follows: Government and Colonization; Foreign Relations and Worship; Finance and Industry; War; Justice and Public Instruction. The President in 1898 was Señor Don Severo Fernandez Alonso, who was inaugurated August 15, 1896. The legislative power is vested in a Congress consisting of a Senate and a Chamber of Deputies. Members of the former number 18 and are elected for six years, and of the latter 64 and are elected for four years. Legal voters are only those who can read and write. The departments which are administered by prefects, are divided into 52 provinces and 374 cantons, administered respectively by sub-prefects and corregidores. The capital of each province has a municipal council. Besides local justices there are eight District Courts and the Supreme Court.

Finance.—The estimated revenues and expenditures in bolivianos for fiscal years have been:

	1894.	1895.	1896.
Revenue	5,234,820	5,670,790	6,305,793
Expenditure	5,721,300	6,077,264	6,727,824
		1897.	1898.
Revenue		6,963,124
Expenditure		6,785,596	5,714,793

It should be noted, however, that subsequent changes were made in some of these estimates; the revenue for 1894 was later officially stated in bolivianos at 3,566,777, and the expenditure at 4,264,681; in 1897 the revenue for 1895 was estimated to have been 4,115,700. In the fall of 1898 Señor Guiterrez reported that the national revenue in 1897 was 4,840,300 of which 2,691,722 were derived from customs. He reported that according to the budget of 1898 the amount to be expended was 5,714,793; of this amount 1,817,489 was for instruction and public works, 1,571,482 for the finance department, and 1,519,218 for the war department. The provincial revenue, which is used in maintaining the provincial government and for local improvements was about 600,000. The external debt, due to Chilean creditors, was originally 6,500,000 bolivianos; at the close of the fiscal year 1897, 5,415,445 had been paid, leaving the debt at 1,084,555. Señor Guiterrez reported the internal debt at 3,707,541 bolivianos; in 1895 it was 3,614,340.

Army.—The peace footing numbers 1,500 men; the national guard comprises all male citizens between 21 and 40 years of age.

Industries and Commerce.—Although the table-lands of Bolivia are among the highest inhabited portions of the earth's surface, large areas are well adapted for

the cultivation of many tropical and sub-tropical products, but agriculture, nevertheless, is in a very unprogressive state, and manufactures of any considerable importance are almost unknown. On account of the absence of a statistical office in the country it is impossible to secure accurate commercial data. The exports include silver, hides, and skins, copper, wool, cacao, cinchona, coffee, gold, and rubber, the last named article affording one of the most important industries of the country. The production of cereals, beans, potatoes, etc., is only sufficient for domestic wants, and sugar, which may be grown very successfully, is largely imported from Peru. The greater part of the Bolivian sugar cane is used for distillation. The country is rich in forests, grazing lands, and in minerals, including silver, copper, tin, bismuth, antimony, gold, and borax. The output of silver in 1894 was 14,519,296 ounces; during the next two years there was a considerable falling off, but the output for 1897, was about 15,000,000 ounces, placing Bolivia fourth among the silver-producing countries of the world. The most important silver district is Huanchaca. Tin is the next metal in importance, the annual export of concentrated ore being about 4,000 tons. The annual export of copper is about 3,000 tons. Gold is found in small quantities, but is produced only from placer diggings of the Indians: the output in 1897 was valued at \$750,000. The government seeks to promote valuable industries by liberal concessions. The chief imports are hardware, cotton, woolen, and linen goods, ready made clothing, provisions, and alcoholic liquors; this trade is largely controlled by Germans. The ports through which Bolivian commerce passes are Mollendo (Peru), Arica and Antofagasta (Chile), and Villa Bella and Puerto Suarez (eastern river ports). The imports for 1894 have been estimated at 6,800,000 bolivianos, and the exports at about 28,442,000.

Communications.—As in most South American countries, internal communication is difficult. There is one railroad, which, running from Antofagasta to the Bolivian border at Ascotan, continues to Uyuni; from the latter point a branch extends to Huanchaca and Oruro, the total length in Bolivian territory being about 500 miles. Other railways have been proposed, concessions have been granted, and in 1898 the routes were being surveyed. The following are among the proposed roads: Santa Cruz to the Paraguay river; Oruro to Cochabamba; LaPaz to the Peruvian border; Chollapata to Potosi; and a line into Argentina. Improvements have been recently made by the construction of new wagon roads and suspension bridges. In 1897, the Bolivian telegraph lines, connecting Argentina with the Pacific coast, together with a number of interior branches, aggregated 2,980 miles in length. The total length of telegraph lines is 2,980 miles; number of offices 68. Bolivia belongs to the postal union and has 156 post offices.

Religion and Education.—The Roman Catholic is the state religion, but other faiths are tolerated. Elementary instruction is gratuitous and nominally compulsory. The following statistics are reported for 1896: Primary schools, 506, having about 800 teachers and about 32,800 pupils; colleges and secondary schools, 16, having 104 professors and 2,139 pupils; universities 6, having 100 professors (law, medicine, theology) and 1,900 students; 70 schools for Indians; 34 mission stations; 160 other schools; a military school having 9 professors and 60 students.

Money.—Bolivia has two commercial banks of issue, the one having a paid-up capital of 3,000,000 bolivianos and the other 2,000,000. There are also three mortgage banks each with a paid-up capital of 100,000 bolivianos. According to the quarterly estimate made by the Director of the United States mint on October 1, 1898, the boliviano was worth in United States gold \$0.436.

Events of 1898.—Late in the summer of 1898 a boundary commission under the leadership of Col. Muñoz, who was said to be one of the most prominent Bolivian statesmen, and Señor Reyes, an efficient engineer, proceeded from Sucre to La Quiaca for the purpose of making topographical observations and anticipatory to the settlement of a boundary dispute with Argentina. In the autumn internal affairs were disturbed by an electoral campaign which seemed to threaten a revolution.

BONAPARTE, NAPOLEON. See FRENCH LITERATURE (paragraph History).

BOND, SIR EDWARD AUGUSTUS, K. C. B., LL. D., F. S. A., sometime principal librarian of the British Museum, died January 4, 1898. He was born December 31, 1815, and was educated at the Merchant Taylors' School. He became in 1838 assistant in the Manuscript Department of the British Museum, keeper of the department in 1866, and was principal librarian from 1878 to 1888. He published: *Statutes of the Colleges of Oxford*, 3 volumes, 1853; *Speeches in the Trial of Warren Hastings*, 4 volumes, 1859-61; *Chronica Monasterii de Melsa*, 3 volumes, 1866-68, Master of the Rolls Series; Fletcher's *Russe Commonwealth*, and Jerome Horsey's *Travels*, for the Hakluyt Society; *Facsimiles of Ancient Manuscripts*, published by the Palaeographical Society, 5 volumes, 1873-88.

BORAX AND BORIC ACID. There was an increased production of borax during the past year, and California continued to be the chief source of supply although

some came from Oregon and Nevada. Since so many of the widely used food products of the present day are preserved by means of these salts, Prof. Chittenden of Yale has undertaken the analysis of their effects on the human system. He experimented on dogs with the view of finding out the effects on their nutrition. The results clearly indicate that moderate amounts of borax are not harmful to the nutrition of the dog's body and probably do no harm when taken into the human body. Dogs weighing 20 to 25 pounds are apparently not affected by daily doses of from $\frac{1}{2}$ to $1\frac{1}{2}$ teaspoonfuls when mixed with their daily food. With larger doses however, poisoning may follow. If either borax or boric acid in amounts of from 1.5 to 2 per cent. of the daily food are taken, nausea and vomiting are apt to result. Both boric acid and borax are without effect on intestinal putrefaction. This is probably due to the rapid absorption from the gastro-intestinal tract, and its quick elimination by the kidneys.

BORNEO is a large island in the Malay Archipelago about 800 miles long and 600 broad, with an area of about 300,000 square miles. The greater part of its territory is under British or Dutch protectorates. The British sphere includes British North Borneo in the northern part of the island and the neighboring territories of Brunei and Sarawak on the northwest coast. **BRITISH NORTH BORNEO** is under the jurisdiction of the British North Borneo Company, but in May 1888, the British government declared a formal protectorate over it and the appointment of the governor must receive the approval of the Secretary of State. The Company sells or leases its lands to planters, whose principal crops are tobacco and coffee. It is a self-supporting colony and has no public debt. Its trade is chiefly through Singapore with Great Britain and the colonies. Among its principal products are timber, sago, rice, gums, coffee, pepper, gambier, gutta percha, tapioca, sweet potatoes and tobacco. A small native military force is maintained for administrative purposes under European officers. **BRUNEI** is also under a British protectorate, the internal administration being left to the Sultan. **SARAWAK**, with an area of about 50,000 square miles has been under English influence since 1842 when Sir James Brooke obtained the government. Under him and his son and successor Sir Charles Johnson Brooke, the colony has flourished. There is a considerable trade in timber and its products are like those of North Borneo. The territories on the coast with an estimated area of 212,737 square miles and an estimated population at the end of 1895 of 1,180,578, are claimed by the Dutch whose principal settlements are at Banjarmassin, Pontiana, Sambas, and Koti. The colony of Labuan is under the control of the British North Borneo Company. The native state of Sulu lies between British North Borneo and the Dutch territories on the East.

BORNU is a state in the Central Soudan with an estimated area of 50,000 square miles and an estimated population of over 5,000,000 comprising chiefly people of mixed negro descent, Tuaregs, and Arabs. The country is one of the most populous of the Mohammedan states in Africa. It is ruled over by a Sultan who is aided in the administration by a council of military chiefs and has a standing army of 30,000. Its capital, Kuka, lies on the west side of Lake Tchad and is an important commercial centre with a population estimated at between 50,000 and 60,000. The Anglo-French agreement excluded Bornu from the French and German spheres of influence.

BORON. The atomic weight of this element has been recently redetermined by F. B. Armitage. As a mean of several experiments, the number chosen is 10.959. Professor Ramsay's number is 10.966.

BOSNIA AND HERZEGOVINA are two Turkish provinces which lie south of the Danube, having Servia on the east and Dalmatia on the west. By the treaty of Berlin in 1878, Austria was authorized to occupy and administer them. Their combined area, including the sanjak of Novi-Bazar, is 23,571 square miles, and their population in 1895 was 1,568,092, of whom 548,632 were Mohammedans, 673,246 belonged to the Oriental Orthodox Church and 334,142 were Roman Catholics. It was estimated in 1895 that 88 per cent. of the population were occupied in agriculture, which, however, is carried on by primitive methods. The soil is fertile and produces among other crops wheat, maize, barley, oats, rice, millet, buckwheat, potatoes, flax and hemp. Tobacco is an important crop in Herzegovina and some wine is also produced in that province. In both provinces fruit is raised in abundance. The natural resources of the provinces are said to be considerable. Minerals abound but mining is mainly conducted by the government. A good many of the inhabitants are engaged in the raising of cattle, goats, sheep, swine and horses. Silk culture and the production of beet sugar are carried on to some extent. It is said that about 45 per cent. of the land is covered with forests. The native military force numbers 5,185 and the Austro-Hungarian army of occupation is about 23,000 strong. The imperial government of Austria-Hungary directs the administration of the provinces through the Bosnian Bureau, at the head of which is the Imperial Minister of Finance at Vienna. The seat of the provincial government is at Sarajevo and con-

sists of three departments, namely for finance, internal affairs, and justice. The local executive bodies are aided in the government by an advisory board consisting of the prelates of Sarajevo and twelve representatives of the people. Recent writers have declared that the internal condition of the provinces has greatly improved under the Austrian rule and a large number of the people have been brought to favor annexation to Austria, although there are still evidences of Panslavist sympathies.

BOTANY. The purpose of the present article is to describe some of the more important features of the progress of the science of botany during the year 1898.

Spermatozoids in Gymnosperms.—In the latter part of the year 1896 and in the beginning of the year 1897 was announced a discovery which, in its bearings upon our knowledge of the inter-relationships of plants, was as full of significance and interest as any that has been made during the last half century. This was the discovery that fertilization in two of the lower seed-plants is effected through the agency of motile spermatozoids essentially as in the higher cryptogams. The credit of this important advance in our knowledge belongs to two Japanese botanists of the Imperial University at Tokio, namely, Dr. S. Hirase, who detected motile spermatozoids in *Ginkgo biloba* and Professor S. Ikeno, who found similar bodies in *Cycas revoluta*. This was soon followed by the discovery of motile spermatozoids in a second cycad, *Zamia integrifolia*, by an American, Mr. H. J. Webber. These notable discoveries bridged over what had been up to that time one of the most important gaps between the gymnosperms and the higher cryptogams, for it had been held that the former, without exception, were *siphonogamous*, i. e. that fertilization was accomplished by means of a non-motile male cell which was brought into contact with the egg by the protrusion of a tube from the pollen-grain and its subsequent growth in the female apparatus; while the higher cryptogams, on the contrary, were *zooidiogamous*, i. e., fertilization was accomplished by a self-motile male cell, the spermatozoid. But *Ginkgo*, *Cycas*, and *Zamia* develop both motile male cells and pollen-tubes, and so are *zooidiogamous* and in a sense *siphonogamous* at one and the same time. Thus has vanished another of the seemingly hard and fast lines in organic nature.

The year 1898 has witnessed the publication of important papers by Hirase and by Ikeno, embodying the detailed results of their investigations upon the development of the sexual organs and the process of fertilization in *Ginkgo* and *Cycas*. The observations of Ikeno upon spermatogenesis in *Cycas* may be summarized as follows: The pollen-grain at maturity consists of two small "prothallium cells" and a large "embryonal cell." Shortly after pollination the grain sends out a tube which penetrates the nucellar tissues of the ovule and into this tube migrates the nucleus of the embryonal cell, while the two prothallium cells maintain their original position. In the course of about a month, the nucleus of the inner of the two prothallium cells, which has increased in size, divides into two; one of these is extruded toward the outer prothallium cell and perhaps corresponds to the stalk of an antheridium; the other, the "body cell" or generative cell, probably homologous with the "central cell" of an antheridium, enlarges and in it appear two bodies which Ikeno, Hirase, and Guignard call centrosomes, but which Webber, believing them to be essentially different from true centrosomes, has named "blepharoplasts." These blepharoplasts first appear in the cytoplasm at opposite poles of the nucleus and in immediate contact with its periphery; they afterward become separated from the nucleus and increase in size until they attain a diameter of 10-15 micromillimeters, finally taking a position such that the line joining them is at right angles to the long axis of the pollen tube. In about another month from the time of origin of this body cell, it divides into two hemispherical daughter-cells, the *spermatids*. The blepharoplast of each spermatid becomes now transformed into a mass of granules which afterwards dispose themselves in a narrow band, and the cell-nucleus sends out a small beak-like process by means of which it comes into intimate contact with this band. The band, remaining attached by one of its ends to the nuclear process elongates and makes five spiral turns in the cytoplasm of the spermatid just within its periphery, and from this band spring very numerous cilia which at first lie in the cytoplasm but later protrude freely from the surface. After a time, the connection between the blepharoplast band and the nucleus vanishes. The matured spermatozoid consists of a large nucleus completely surrounded by a cytoplasmic mantle, which in the anterior half is thrown into a helicoid spiral ridge having four or five turns, the corresponding spiral furrow being occupied by the ciliiferous band; a section shows that the surface of the nucleus itself has ridges and furrows exactly corresponding to those of the cytoplasm. The

tully ripened spermatozoid has a tail-like process of about the length of its body. The tail is evidently a prolongation of the posterior portion of the cytoplasmic mantle. Ikeno was not so fortunate as to see the spermatozoids in a living moving condition. Their movements have, however, been observed by Hirase in *Ginkgo* and by Webber in *Zamia*. Webber was able to keep those of *Zamia* in motion in a sugar solution for periods varying usually from thirty minutes to sixty minutes,—in one case, even for two hours and forty-four minutes. A tail is present in the spermatozoids of *Ginkgo*, developed, according to Hirase, at the moment of their breaking forth from the pollen-tube, but no such appendage was found by Webber in those of *Zamia*. The tail of the spermatozoids of *Ginkgo* and *Cycas* is not to be homologized with that of the spermatozoa of animals. The spermatozoids of these gymnosperms are much larger than any motile male cells known elsewhere in either the vegetable or animal kingdoms and on this account they lend themselves well to the study of development in details which are not easily followed out in smaller cells. The living spermatozoids of *Zamia* are visible to the unaided eye, being, according to Webber, 258-332 μ in length by 258-306 μ in width; those of *Cycas* (seen only in material treated with reagents) are considerably smaller, being described by Ikeno as 160 μ long (one half of which is occupied by the tail) and 70 μ broad. In *Cycas*, on the penetration of the egg-cell by the spermatozoid, the sperm-nucleus slips out from its cytoplasmic mantle which soon disorganizes within the egg while the nucleus proceeds toward the egg-nucleus, which by this time exhibits a crater-like depression for its reception. The sperm-nucleus comes in contact with the egg-nucleus at this depression and presses deeper and deeper into the egg-nucleus until its entire body lies within the latter. Then the sperm-nucleus loses its membrane and fuses with the nuclear substance of the egg. This penetration of the egg-nucleus by the unchanged sperm-nucleus appeared to Ikeno to be a phenomenon not elsewhere observed in either the animal or vegetable kingdoms, though the discovery of a similar procedure in *Onoclea* and *Marsilia* had been announced by Shaw two or three months previously. It is stated by Ikeno that by reason of the extraordinary size of the sexual nuclei of *Cycas* certain of the stages in their conjugation can be perceived with the naked eye by the use of transmitted light upon sections permanently mounted in the ordinary way.

Centrosomes and Blepharoplasts.—Recent investigations upon plant spermatozoids, notably those of Belajeff in the Equisetineae, Filicineae and Characeae, Hirase in *Ginkgo*, Ikeno in *Cycas*, Webber in *Zamia*, and Shaw in *Onoclea* and *Marsilia*, have added much not only to our knowledge of the structure and development of the spermatozoids themselves, but have also brought out many facts bearing upon the vexed question as to the nature and function of the *centrosome*. It is now generally agreed that the body of the spermatozoid is formed of both nucleus and cytoplasm and that there is present in the spermatid a definite organ, variously known as Nebenkern, Körperchen, attraction-sphere, centrosome, blepharoplast, etc., which plays an active part in the formation of the cilia. The behavior of this body is, in general, much the same in all the forms studied, though differing in certain details. The blepharoplasts of *Zamia* are the largest yet discovered, attaining at their maximum a diameter of 18-20 μ . Their history and development as described by Webber in his various papers may be outlined as follows. The two blepharoplasts arise *de novo* in the cytoplasm of the generative cell. They appear first as minute bodies at opposite ends of the nucleus just outside the nuclear membrane. They are spherical and stain deep red with safranin in the Flemming triple stain process, are homogeneous in structure or sometimes contain a few very small vacuoles. At first but a few kinoplasmic filaments radiate from them but later these become abundant, the blepharoplasts at the same time increasing in size. The threads of kinoplasm are rather coarse and are plainly visible even without staining. Many of these extend quite to the *Hautschicht* of the cell and appear to unite with it; others may be seen to run to the nuclear wall. By this time the blepharoplast shows a clearly differentiated outer membrane. When the nuclear spindle is formed, the blepharoplasts always take a position in the cytoplasm directly opposite the polar ends, though the spindle fibers appear to be wholly within the still intact nuclear membrane and the kinoplasmic radiations, so conspicuous about the blepharoplast in the resting condition, have now entirely disappeared. It would therefore appear that there is no direct physical connection between these bodies and the nuclear spindle, though their peculiar and constant relations suggest that the blepharoplasts either determine the position of the nuclear spindle or *vice versa*. In an early anaphase of the cell division, the vacuolated contents of the blepharoplast begin to draw away from its bounding membrane, which meanwhile increases in size. When the metaphase stage has been reached the contents have shrunk to a very small mass and the outer membrane has become broken into numerous segments or plates. It is thought by Mr. Webber that the disappearance of the contents of the blepharoplast is correlated in some way with the growth of its outer membrane, possibly being utilized in the growth process

as food material. In an early telephase, the blepharoplast is represented by an irregularly spherical mass composed of round or oblong granules apparently derived from the breaking down of the membrane to which allusion has been made. In a late telephase a slender band may be seen to protrude from this mass and to bend toward the spermatid nucleus. The band increases in length and width, its development being apparently accompanied by the disappearance and fusion of the granules. Webber does not describe or figure a union between the band and the nucleus such as was observed by Ikeno in *Cycas* and by Hirase in *Ginkgo*. The subsequent elongation of the blepharoplast band, its disposition in a helicoid spiral in the cytoplasm just underneath the *Hautschicht* of the free side of the spermatid, and the development of the cilia from it, take place essentially as has been described in *Cycas*. Whether the blepharoplast is to be considered a centrosome or not seems to depend largely upon one's conception of what a centrosome is. Webber in proposing the new term blepharoplast has voiced the hitherto prevalent view as to the nature of the centrosome by remarking: "If the bodies in question are compared to typical centrosomes such as occur in *Fucus*, as described by Strasburger, and in *Stypocaulon*, as described by Swingle, the dissimilarity of the two organs becomes striking. The two most important features of a centrosome, namely, continuity from cell to cell, and forming the centre of an aster at the pole of the spindle during karyokinesis, are not shown by the centrosome like bodies of *Zamia* and *Ginkgo*." Guignard, Ikeno, and Hirase, however, look upon the blepharoplast as a true centrosome modified for the performance of a special function in giving rise to the cilia. Belajeff though not prepared to assert the identity of blepharoplasts and centrosomes in absence of direct evidence, nevertheless holds that this hypothesis has much in its favor. Shaw who finds blepharoplasts in the mother-cells of the spermatids of *Onoclea* and *Marsilia*, sees no ground for believing that they are either homologous or analogous with the centrosomes of the Algæ and Hepaticæ and states that whether there is any relationship whatsoever between these bodies must be determined by a thorough-going investigation of spermatogenesis and zoospore-formation in the lower plants and that at the present moment we are justified only in expressing the view that they are kinoplasmic bodies set apart for the formation of cilia. The existence of centrosomes in the spermatophytes and pteridophytes was left in much doubt in 1897 by the researches of Osterhout, Mottier, Juel, and Strasburger, together with the earlier (1895) investigations of Farmer. Osterhout showed that in the beginning of spindle-formation in the spore mother cells of *Equisetum limosum*, (1) there differentiates itself in the cytoplasm close about the nuclear wall a felted layer consisting of fibers which at first run irregularly but later arrange themselves radially about the nucleus; (2) that through the union of the ends of these fibers several fiber-bundles are formed, giving the structure as a whole a radially multi-polar appearance; (3) that after the disappearance of the nuclear-wall and the union of the fibers with the threads of the linin-network, the spindle becomes bipolar through the blending of the at first independently focussed fiber-bundles. No centrosomes were seen and in the ordinarily accepted view as to their function and mode of action there would be no place for them in the process as here described. Mottier obtained practically the same results in his investigations on the origin of the spindle in the pollen mother cells of several monocotyledons and dicotyledons, as did also Juel in his studies of *Hemerocallis*. During 1898, however, two or three observers have reaffirmed the existence of centrosomes in phanerogams outside of the questionable centrosomes (blepharoplasts) of the lower gymnosperms. Guignard finds them in the pollen mother cells of *Nymphaea* and *Nuphar*. He states that the spindles in an early prophase are sometimes multipolar, but observes very often at their extremities "a granule or a more or less distinct sphere serving as the point of departure for achromatic threads." He adds: "It does not appear permissible to advance the formation of multipolar spindles, which may be accidental or normal as an argument against the existence of dynamic centres during nuclear division. It remains a fact that at a certain time there appear in the cytoplasm bodies distinct from the ordinary granules. It is possible that the construction of the multipolar figures may be independent of the elements which form centrosomes. It may also be true that centrosomes are not always definite morphological units. But it is none the less certain that the higher plants possess differentiated elements whose rôle is the same as that of those analogous bodies observed in the lower plants and in animals." J. H. Schaffner has recently described and figured centrosomes and centrospheres of the typical kind in the dividing cells of the root-tip of *Allium Cepa*. He finds the karyokinetic spindle bipolar from the first and states that it is here an impossibility that it should arise from an aggregation of multipolar structures. E. L. Fulmer gets like results in his studies of cell division in pine seedlings. In no case did he find multipolar spindles in prophases of karyokinesis. However, in sliced or injured karyokinetic figures of the anaphase condition, he observed very rarely spindles which appeared to be multipolar.

The investigations of Belajeff, Hermann, Ikeno, and others upon spermatogenesis now make it probable that the blepharoplast in plants corresponds to the deeply staining *Körperchen* in the spermatid of the salamander and of the mouse, that the ciliiferous band, therefore, of the plant spermatozoid corresponds to the middle-piece of the animal spermatozoon, and that a single cilium of the plant spermatozoid is homologous with the slender thread-like tail of the animal male cell.

B. M. Davis, in studying nuclear division in the tetraspore mother cells of *Corallina officinalis*, var. *Mediterranea*, finds large centrospheres which first make their appearance in the prophase of karyokinesis. They play a part in the formation of the spindle-threads, but seem to vanish entirely in the late anaphase.

D. M. Mottier has discovered what appear to be true centrosomes in the tetraspore mother cells of *Dictyota dichotoma*.

Miscellaneous Cytology.—Important papers on the cytology of the yeast-plant have appeared during the past year, the principal contributors being Janssens and Leblanc, Bouin, Errera, and Wager. Wager finds a "nuclear apparatus" in all yeast-cells, consisting of a never-failing nucleolus (the nucleus of most of the earlier observers) in close contact, in the earlier stages of fermentation, with a vacuole which exhibits a granular chromatin network. In later stages of fermentation, the chromatin-containing vacuole may disappear, its chromatin granules being scattered through the cytoplasm or aggregated about the nucleolus. In budding, there is a division of the nuclear apparatus with no definite stages of karyokinesis. In spore-formation, phenomena are observed which doubtfully indicate a very simple karyokinetic process.

Janssens and Leblanc also find in every yeast cell a nucleus which is made up of a membrane, a caryoplasm, and a nucleinated nucleolus. The nucleus becomes vacuolated at the beginning of the fermentation and in it the nucleolus, in the living state, occupies a central position instead of being external to it as described by Wager. In the budding of *Saccharomyces Ludwigii* and *S. octosporus*, the nucleus shows a rudimentary karyokinetic division; in *S. cerevisiae*, however, the division is direct. In a cell preparing to form spores, two nuclei appear which fuse, resulting, according to these investigators, in a fecundated egg; but this is otherwise explained by Wager. The division of the nucleus resulting from the alleged fusion is attended by the formation of a reduced karyokinetic figure. Errera finds no nuclear body in the young cells of yeast. Bouin states that under certain conditions yeast-cells increase in size and become plurinucleate, that division in the formation of spores always partakes of the indirect method, though in budding direct division is more common.

L. Mitzkewitsch has recently studied cell-division in *Spirogyra* with special reference to the behavior of the nucleus and the so-called nucleous. *Spirogyra subæqua* and *S. jugalis* were the species investigated. It was found that in a strictly resting condition the chromatin is concentrated in the nucleolus, that in the beginning of karyokinesis, processes from this are sent out which extend to the nuclear membrane, resulting, in *S. jugalis*, in the apparent disappearance of the nucleolus through its conversion into a tangle of granular deeply staining threads. Preparatory to the formation of the nuclear plate, the processes of the nucleolus are withdrawn or the threads into which it has been resolved collect at the centre of the nucleus. The chromosomes, in either case, owe their origin to material which is in a strict sense nucleolar.

C. van Wisselingh, also, has studied the nucleolus of *Spirogyra crassa* and the part played by it in cell division, obtaining results quite different from those of Mitzkewitsch, due in great measure, the former thinks, to different methods of investigation. Van Wisselingh finds two rather short and stout nucleolar threads in the resting condition of every nucleus, both enclosed within the membrane of the single nucleolus if only one nucleolus is present, or constituting singly the contents of the two nucleoli if two are found. Two modifications of karyokinesis are said to occur, but in either case the substance derived from the nucleolus forms but a minor part of the nuclear plate and can always by its behavior toward chromic acid be distinguished from the material derived from the nuclear network. In the daughter cells the nucleoli and nuclear network are reformed from the corresponding substances of the mother nucleus.

E. Zacharias takes the ground that for the accurate determination of nuclein the study of stained preparations is not always sufficient, that other microchemical investigations and, if possible, the study of the object in the living condition should be added. Zacharias considers the recent results of Mitzkewitsch in regard to the nature of the nucleolus in *Spirogyra* inconclusive for the reason that they were based wholly upon staining reactions.

Other important cytological papers of the year are,—E. Strasburger: *The Vegetable Cell-Membranes*; C. van Wisselingh: *Microchemical Investigations on the Cell Walls of the Fungi*; W. Belajeff: *On the Reduction-Division of the Plant Nucleus*; B. Debski: *Further Observations on Chara-Fragilis*; C. Hoffmeister: *On the Microchemical Demonstration of Cane-Sugar in Vegetable Tissues*.

Histology and Morphology.—E. C. Jeffrey has found in Canada several hundred prothallia of *Botrychium Virginianum* and has described and figured their structure in detail. The prothallia of *Botrychia* have been quite imperfectly known, partly on account of their subterranean habit of growth; that of *B. Lunaria* was described by Hoffmeister in 1854, and that of *B. Virginianum* by Campbell in 1894, but neither of these investigators was able to study the development of the sexual organs and of the embryo on account of the advanced age of the available prothallia. The gametophyte of *Ophioglossum pedunculatum* was described by Mettenius in 1856, but his observations were somewhat incomplete by reason of paucity of material. Very little else had been added to the knowledge of the gametophyte of the Ophioglossaceæ until the appearance of Jeffrey's paper. The prothallia of *B. Virginiana* are subterranean, wholly destitute of chlorophyll, oval in form, 2-20 mm. in length, and 1.5-15 mm. in breadth, and are all infected by an intracellular endophytic fungus which apparently lives in symbiotic relations with them. The youngest prothallium found bore antheridia, these being situated on a dorsal median ridge, on the flanks of which the archegonia arise a little later. The spermatozoids are of the usual filicineous type. Nothing comparable to a "blepharoplast" was detected. The first division of the fertilized egg is transverse as in the other eusporangiate pteridophytes. The general results of Jeffrey's investigations serve to emphasize the affinity of the Ophioglossaceæ with the Filicineæ and to weaken the force of the comparison with the homoporous Lycopodineæ which has recently been made by Bower.

W. H. Lang, who has been studying apogamy and the development of sporangia upon the fern prothallia, puts forth a provisional hypothesis as to the origin of the sporophyte in archegoniates which corresponds in general outlines with the homologous alternation theory. Mr. Lang admits, however, that the theory of antithetic alternation also affords a possible explanation of the alternation phenomena and that any evidence which would render either one or the other untenable is wanting. Lang finds in the facts of apogamy possible evidence that the vascular cryptogams have been derived directly from algal forms in a line of descent entirely distinct from that of the bryophytes.

W. C. Worsdell, as a result of researches upon the vascular structure of the sporophylls of various Cycadaceæ, finds that though the sporophyll, according to his view, "is a more primitive organ than the foliage-leaf, . . . the main and, physiologically most important part of its vascular structure has become, as a result of the sporangiferous function, much more highly modified from the primitive type than that of the foliage-leaves."

E. Hannig holds that the powder-pits of the stem and leaves of the Cyathaceæ and those of the stipules and leaf-stalks of the Marattiaceæ are comparable organs in structure and development and that they function as pneumatodes, but are in structure and origin not to be compared with ordinary lenticels.

J. P. Lotsy has published results of studies upon the embryology of *Gnetum Gnemon*, largely confirming those obtained by Karsten from other species of this genus. The male gametes are not developed as spermatozoids.

Fr. Oltmanns has published an important paper upon the developmental history of the Florideæ. He finds as a result of exhaustive investigations upon five species that in no case is there a nuclear fusion in the auxiliary cells of the carpogonium and that a double fertilization in the Florideæ in the sense in which it was believed by Schmitz to occur very probably does not exist. His results are not merely negative for he has traced out the behavior of the nuclei of the sporogenous filaments—the ooblastema filaments of Schmitz—in the auxiliary cells and their ultimate fate. Oltmanns recognizes in the Florideæ gametophyte and sporophyte corresponding with the gametophyte and sporophyte of the Muscineæ. The sporophyte frequently sends out branches which come into intimate union with certain cells of the gametophyte, but this union is for the purposes of nutrition and has in it nothing of a sexual character.

Some of the more important papers of 1898 relating to the histological and morphological aspects of botany, outside of those already discussed, are,—H. Vöchting: *On Flower Anomalies*—statistical, morphological, and experimental investigations; A. Boirivant: *Organs of Replacement in Plants*; W. F. Ganong: *Contributions to a Knowledge of the Cactaceæ, II. The Comparative Morphology of the Embryos and Seedlings; Upon Polyembryony and Its Morphology in Opuntia Vulgaris*; D. H. Campbell: *The Development of the Flower and Embryo in Lilaea Subulata* H. B. K.; J. M. Coulter: *Contributions to the Life History of Ranunculus*; E. A. Bessey: *The Comparative Morphology of the Pistils of the Ranunculaceæ, Alismaceæ, and Rosaceæ*; W. R. Smith: *A Contribution to the Life History of Pontederiaceæ*; C. MacMillan: *The Orientation of the Plant Egg and Its Ecological Significance*; T. Holm: *Pyrola Aphylla, a Morphological Study*; F. E. Lloyd: *On an Abnormal Cone in the Douglas Spruce, Pseudotsuga Mucronata, On Hypertrophied Scale-Leaves in Pinus Ponderosa*; D. S. Johnson: *On the Development of the Leaf and Sporocarp*

in *Marsilia Quadrifolia* L., On the Leaf and Sporocarp of *Pilusaria*; A. Y. Grevillius: On the Morphological Value of the Blood-organs in *Aulacomnium Androgynum* (L. Schwaegr.); R. W. Phillips: The Development of the Cystocarp in the Rhodymeniales, II. Delesseriaceæ; A. H. Church: The Polymorphy of *Cutleria Multifida* (Grey.); J. Eriksson: A General Review of the Principal Results of Swedish Research into Grain Rust; Bertha Stoneman: A Comparative Study of the Development of Some Anthranoses; P. Magnus: On *Accidium Graveolens* (Shuttlew).

Plant Physiology.—Experiments to show the effect of the X-rays upon the various phases of plant-life have in most cases seemed to prove that they exert no special influence. MM. Maldiney and Thouvenin, however, report that, while the rays are without influence upon the formation of chlorophyl, they do, under the proper conditions, hasten quite perceptibly the germination of certain seeds.

B. Raciborski announces the discovery in vascular plants of a substance to which he gives the name *leptomin*. It occurs especially in the sieve-tubes and laticiferous vessels, organs which are concerned particularly with the transfer of organic food-materials, though it is found also in the lenticels, pneumatodes, and aerenchymatous tissues of certain plants. From the localization of leptomin and its chemical behavior, Raciborski believes that it is concerned in respiration and that it plays a rôle in plants analogous to that of the haemoglobin and haemocyanin of animals; that is, it serves as an oxygen-laden vehicle for the maintenance of the inner breathing. In a subsequent paper, however, Raciborski admits that the question as to the function of leptomin is still an open one.

B. Schmid finds that the awns of the Gramineæ play an important part in the transpiration activities of the plant, and that in many cultivated barleys and wheats they carry on $\frac{1}{4}$ to $\frac{1}{3}$ the entire transpiration of the plant, their activity being proportionately greater in the night than in the day and also in diffuse sunlight than in direct.

Ch. Dassonville has made extended researches upon the influence of mineral salts upon the form and structure of plants. He determines that cutinization, sclerification, and lignification, are more pronounced in young plants grown in distilled water than in those of the same age grown in mineral solutions and argues that in the absence of high nutrition the seedling devotes itself to cell differentiation, while on the other hand, if grown in a rich nutrient medium, its energies go to cell multiplication with less differentiation. The effect of different salts upon the development of the various tissues was also investigated.

J. Wiesner has shown that in "high northern latitudes (Advent Bay, Tromsö) the chemical intensity of the total daylight, with equal elevation of the sun and equal cloudiness, is greater than in Vienna and Cairo, but less than in Buitenzorg, Java;" that, with some exceptions, the share of the total light which plants obtain is greater the smaller the intensity of the total light is; and that the greatest proportion of the total light is received by plants of the arctic regions.

The researches of S. H. Vines during 1898 confirm his results published during the preceding year that, contrary to the views of Dubois and Tischutkin, the pitcher-liquid of *Nepenthes* contains a proteolytic enzyme. This enzyme appears to be derived from a zymogen present in the gland-cells. It is very stable and is most active in an acid medium.

J. R. Green, endeavoring to confirm the discovery announced by Buchner in 1897 that the alcoholic fermentation of sugar is due to a soluble ferment or enzyme, which, by proper means, can be extracted from the yeast-cells, has carried on experiments during both 1897 and 1898. His first results, when he made use of yeasts practically in a resting condition, after the greatest activity of the fermentation had subsided, were negative, and he came to the conclusion that the English yeasts, at least, contained no alcohol-producing enzyme. In his later researches, however, he used for purposes of extraction yeasts taken at the moment of their greatest activity in fermentation, and thus obtained an easily decomposed enzyme, essentially confirming the statements of Buchner. The yeast was crushed and filtered until no cells could be detected in the filtrate by microscopical examination, and, as a check against error from inclusion of unobserved living cells, there was added to the solution an excess of chloroform, which prevents the growth of the yeast.

G. Hörmann has published the results of studies upon the protoplasmic streaming in the Characeæ. He finds an explanation of the direction and plane of streaming in the advantage of guarding against loss of materials by securing the shortest route between the place of their absorption or elaboration and the place of their utilization. He discovers that the *Nitella* cell may be stimulated and concludes that there is a conductive plasma differing in nature from the substance which is concerned with the phenomena of contraction and streaming.

W. and G. S. West have called attention to the wide occurrence of parthenogenesis and various methods of non-sexual propagation in the Conjugatæ.

H. O. Juel has made a careful embryological study of *Antennaria alpina* and seems

to have demonstrated that parthenogenetic reproduction occurs here—what had before been circumstantially assumed for this species by Kerner and also for other species of the same genus by E. L. Greene.

Nawaschin, as a result of investigations upon the behavior of the pollen-tube in the dm, holds the view that in *Ulmus pedunculata* and *U. montana* a transitional type from chalazogamy to porogamy is to be recognized.

Some of the remaining physiological papers of 1898 are,—

J. Wiesner: *On Heliotropism produced by diffuse Daylight*; H. Vöchting: *On the Influence of low Temperature on Sprout Direction*; L. Jost: *Contributions to the Knowledge of nyctitropic Movements*; F. A. F. C. Went: *Chemico-physiological Investigations on the Sugar-cane*; J. Katz: *The regulatory Formation of Diastase by Fungi*; M. Nordhausen: *Contributions to the Biology of parasitic Fungi*; G. Bitter: *On the Behavior of Crustaceous Lichens in the meeting of their Margins*; R. Kolkwitz: *On the influence of Light upon the Respiration of the Lower Fungi*; G. Curtel: *Physiological Researches on the Flower*; D. T. MacDougal: *A Contribution to the Physiology of Tendrils*; B. D. Halsted: *Starch Distribution as affected by Fungi*; F. L. Stevens: *The Effect of Aqueous Solutions upon the Germination of Fungus Spores*; W. C. Sturgis: *On some Aspects of Vegetable Pathology and the Conditions which influence the Dissemination of Plant Diseases*; R. H. True: *The physiological Action of certain plasmolyzing Agents*; H. H. Dixon: *On the Effects of Stimulative and Anæsthetic Gases on Transpiration; Transpiration into a saturated atmosphere*; F. DeF. Heald: *A Study of Regeneration as Exhibited by Mosses; Conditions for the Germination of the Spores of Bryophytes and Pteridophytes*; C. Correns: *On the Propagation of Musci by Leaf-and-Sprout-Fragments*.

Ecology and Plant Geography.—A striking feature of the botanical activity of 1898 is the attention that has been given to plant-ecology and plant-geography. "Ecology" has been defined by Haeckel as "the knowledge of the sum of the relations of organisms to the surrounding outer world, to organic and inorganic conditions of existence," including the adaptations of organisms to their surroundings, their modifications in their struggle for existence, etc. An important ecological publication of the year is a richly illustrated book of 876 pages by A. F. W. Schimper, dealing with plant-geography on a physiological basis. Another is F. Pax's *Outline of Plant Distribution in the Carpathians*, constituting the second volume of Drude's *Die Vegetation der Erde*. A two-volume work on phytogeography and ecology is R. Gradmann's *Plant Life of the Swabian Alps*. An ecological work of a special character—of which vol. I and the first part of vol. II have appeared—is P. Knuth's *Handbook of Flower-biology*, based upon H. Müller's *Fertilization of Flowers by Insects*. Among other ecological books and papers of note published in 1898, may be mentioned J. Constatin: *Plants and their Cosmic Environment*; Borgesen and Paulsen: *On the Vegetation of the Danish West-Indian Islands*; R. Pounds and F. E. Clements: *The Phytogeography of Nebraska. I. General Survey and the Vegetation Regions of the Prairie Province*; W. L. Bray: *On the Relation of the Flora of the Lower Sonoran Zone in North America to the Flora of the Arid Zones of Chile and Argentine*; Colgan and Scully: *Contributions towards a Cybele Hibernica, being outlines of the Geographical distribution of plants in Ireland* (2d ed.—founded on papers of the late A. G. Moore); L. Blanc and E. Decrock: *Geographical Distribution of the Primulaceæ*; L. Adamovic: *The Vegetation-formations of East Servia*; E. Ihne: *On the Phænology of Coimbra*; E. Ule: *On the Floral-contrivances of some Aristolochias in Brasil*; Charles Robertson: *Flowers and Insects*.

Text-Books and Works Relating to General Botany.—An important botanical publication of 1898 is Prof. K. Goebel's *Organography of Plants*. Part I, dealing with general organography, and the first section of part II, dealing with the special organography of the bryophytes have already appeared. The second edition of Kerner's *Pflanzenleben*, the first edition of which has become widely known to English speaking peoples through Prof. Oliver's translation, has now been completed. Of other standard botanical works, new editions may be mentioned as follows: Strasburger, Noll, Schenck, and Schimper: *Textbook of Botany for High Schools*, 3rd ed., and also an English translation of the 2nd ed. (1895) by H. C. Porter; Ph. Van Tieghm: *Éléments de Botanique*, 3rd ed.; Wiesner: *Anatomy and Physiology of Plants*, a 4th ed. of the first part of his *Elements of Scientific Botany*; L. Trabut: *Digest of Medical Botany*, 2nd ed. Among new text-books for the use of schools and colleges are—G. F. Atkinson: *Elementary Botany*; C. R. Barnes: *Plant Life considered with special reference to form and function*; Th. Bokorny: *Text-Book of Botany*; Poli and Taufani: *Descriptive and Comparative Botany for the use of Gymnasia* (2 vols.); A. Meyer: *First Practicum for the Microscope. An introduction to the Use of the Microscope and to the Anatomy of the higher Plants*; S. H. Vines: *An Elementary Text-book of Botany*; Percy Groom: *Elements of Botany*;

L. H. Bailey: *Lessons with Plants*; J. C. Arthur and D. T. MacDougal: *Living Plants and their Properties*; W. J. Beal: *Seed Dispersal*; C. M. Weed: *Seed Travellers—a study of methods of distribution of various common seeds*; A. C. Seward: *Fossil Plants, for students of botany and geology*; A. B. Frank: *Manual of Agricultural Botany* (English translation by J. W. Patterson); M. Hollrung: *Handbook of Chemical Resources against Plant Diseases*; G. Dragendorff: *The Medical Plants of various Peoples and Times*.

Systematic Botany, General.—A recent work of general interest relating to systematic botany is the second edition of Engler's *Syllabus of the Families of Plants*, which is based upon Engler and Prantl's "*Die natürlichen Pflanzenfamilien*," with some modifications to embody the results of modern discoveries and Engler's more recent views as to the outlines of classification. The Conjugatæ are excluded from the Chlorophyceæ and made a class coördinate with the latter; the lichens appear again as a single group with the rank of a "Nebenklasse;" *Ginkgo* is made to constitute a class—the Ginkgoales—coördinate with the Cycadales, Coniferæ and Gnetales; and the use of chalazogamy and porogamy in the classification of the angiosperms is abandoned. The important *Die natürlichen Pflanzenfamilien* of Engler and Prantl has been advanced during the year by the publication of several parts; the *Umbellifera* have been elaborated by Drude and the *Cornaceæ* by Harms, thus completing the treatment of the Archichlamydeæ (Apetalæ and Polypetalæ); introductory discussions of the Pteridophyta by Sadebeck, of the Musci by C. Müller (Berlin), and of the *Phallineæ* by E. Fisher, have appeared, and the treatment of the Hymenomycetinae by P. Hennings has been brought to a close.

A continuation of O. Kuntze's *Revisio Generum Plantarum*, suggesting many changes in the current nomenclature, is of interest to taxonomists. Of systematic works having an unlimited geographical range, some of the more important for the year 1898 are—F. Stephani: *Species Hepaticarum*, a beginning of the description of all the known Hepaticæ of the world; O. Warburg: *Monograph of the Myristivaceæ*; Madame Weber-Van Boose: *Monograph of the Coulerpas*; E. B. Uline: *A Monograph of the Dioscoreaceæ*; O. V. Darbishire: *Monograph of the Rocellei*; F. Hildebrand: *The Genus Cyclamen*; A. Brand: *Monograph of the Genus Lotus*; A. Froehner: *The Genus Coffea and its Species*; R. Schlechter: *Revision of the Genus Holothrix*, also a *Monograph of the Disperideæ*; Fr. Buchenau: *Lusula campestris and related Species*; K. Fritsch: *On the Taxonomy of the Genus Sorbus*; K. von Keissler: *The species of the Genus Daphne of the Section Daphnanthes*; F. N. Williams: *Revision of the Genus Arenaria*, also *A Provisional Enumeration of the Species of the Genus Cerastium*; A. Engler: *Revision of the Genus Anthurium Schott*; P. Parmentier: *Anatomical and Taxonomic Researches on the Roses*; H. C. Irish: *A Revision of the Genus Capsicum with special reference to the garden varieties*; G. Massee: *Revision of the Genus Cordyceps*; C. Warnstorf: *Contributions to the Knowledge of exotic and European Bog-mosses*; M. Heeg: *Contributions on some Species of the Genus Riccia*; C. Sauvageau: *On some Myrionemaceæ*.

Europe.—Among the principal books and papers of the year relating to the systematic botany of Europe may be mentioned—Ascherson and Graebner: *Flora of the northeast German Lowlands*, (farther East-Prussia), also continuations of their *Synopsis of the middle-European Flora*; Garcke: *Illustrated Flora of Germany*, (18th ed.); E. G. Camus: *Catalogue of the spontaneous hybrid Plants of the European Flora*; Migula: *Synopsis of the European Characeæ* (illustrations and descriptions, with reference to those of other parts of the world—an abstract of his elaboration of this group for Rabenhorst's *Kryptogamen-Flora*); J. Neuberger: *Flora of Freiburg*; A. X. P. Coutinho: *The Monocotyledons of Portugal*; Th. Heldreich: *Flora of the Island of Eginæ*; Limpricht, in the *Rabenhorst Kryptogamen-Flora* has completed his treatment of *Amblystegium* and begun that of *Hypnum*.

Asia.—Some of the more important floristic works of the year relating especially to Asia and the adjacent islands are—G. King and R. Pantling: *The Orchids of the Sikkim-Himalaya*, a magnificent monograph constituting the eighth volume of the *Annals of the Royal Botanic Garden at Calcutta*; A. Franchet: *Plantarum Sinensium Eclogæ Secunda*; H. de Boissieu: *The Leguminosæ of Japan collected by M. l'Abbé Faurie*; J. Freyn: *On new and noteworthy species of oriental Plants*; J. Bornmüller: *A Contribution to the Flora of Syria and Palestine*; H. W. Feilden: *The Flowering Plants of Novaya Zemlya*; K. Schumann: *Flora of New Pomerania*; H. Hallier: *New and noteworthy Plants from the Malay-Papuan Islands*; Raciborski: *The Pteridophytes of the Flora of Buitenzorg* (the first part of a projected convenient systematic guide to the flora of the region of the Botanical Garden at Buitenzorg, Java); H. Christ: *Ferns of the Philippine Islands*, also, *Ferns of Mengtze (China)*; Baroni and Christ: *Ferns and Fern-allies collected in China by Rev. Giraldis*; A. Geheeb: *On the Moss-flora of New Guinea and Borneo*; K. Müller: *Bryologia Giraldisiana*; E. Bescherelle: *Bryologia Japonica Suppl. I*;

C. Holterman: *Mycological Researches from the Tropics*; M. Raciborski: *On the seven Slime-moulds*; N. Patouillard: *Some Fungi from Java*; papers on the Asiatic flora have been published also by B. and O. Fedtschenko.

Africa.—Notable advances in the knowledge of the African flora have been made during the year. Part II. of the first volume of the *Conspectus Floræ Africæ* by Th. Durand and Hans Schinz and the second fascicle of Durand and Wildeman's *Materials for the Flora of the Congo* have appeared, as has also the second part of W. P. Hiern's *Catalogue of the African Plants collected by Dr. Friedrich Welwitsch in 1853-'61*. Other papers of importance relating to African plants have been published by Engler, Schinz, Diels, Gürke, Giggl, Hallier, Schlechter, Schmidle, Schönland, E. G. Baker, and Rendle.

Polynesia.—F. Reinecke has completed his *Flora of the Samoan Islands*; K. Müller has continued his work on the bryology of Australia; and E. Bescherelle has published papers bearing upon the bryological flora of Tahiti and other of the Society Islands.

North America.—The publication of the third and final volume of Britton and Brown's *Illustrated Flora of the Northern United States, Canada, and the British Possessions*, is an important event in the progress of systematic botany in America. In the entire work 4,162 species are described and illustrated. The nomenclature is revised in accordance with the rules adopted by the Botanical Club of the American Association for the Advancement of Science and the arrangement of the classes, families, etc., is intended to express as well as is possible in a lineal sequence the latest advances of knowledge in regard to their mutual affinities. The 12th volume of C. S. Sargent's elaborate *Sylva of North America*, concluding the treatment of the *Coniferae* has appeared. Of the papers of the year relating to the systematic botany of the North American continent and outlying islands, the following may be mentioned—I. Urban: *Symbolæ Antillanæ seu Fundamenta Floræ Indiæ Occidentalis*, the beginning of what is intended to be a comprehensive work on West Indian botany; P. A. Rydberg: *Monograph of the North American Potentilleæ*; E. L. Greene: *Studies in the Compositæ, New or Noteworthy Species, Critical Notes on Antennaria, New Compositæ from New Mexico*; B. L. Robinson: *Revision of the North American and Mexican Species of Mimosa, Revision of the North American Species of Neptunia, New Species and Extended Ranges of North American Caryophyllaceæ*; J. K. Small: *Studies in the Botany of the South-eastern United States, Studies in the North American Polygonaceæ, Notes and Descriptions of North American Plants*; M. L. Fernald: *The Genus Antennaria in New England, Notes Upon Some North-western Castillejas of the Parviflora Group*; J. M. Greenman: *Revision of the Mexican and Central American Species of Galium and Rubium, Diagnoses of New and Critical Mexican Phanerogams, Some New and Other Noteworthy Plants of the Northwest*; A. M. Vail: *Studies in the Asclepiadaceæ*; Alice Eastwood: *Studies in the Herbarium and Field*; J. Donnell Smith: *The Polypetale in Pittier's Primitiæ Floræ Costaricensis, Undescribed Plants from Guatemala and other Central American Republics*; A. A. Heller: *New and Interesting Plants from Western North America, Catalogue of North American Plants North of Mexico, Exclusive of the Lower Cryptogams*; G. V. Nash: *New or Noteworthy American Grasses, A Revision of the Genera Chloris and Eustachys in North America, The Genus Syntherisma in North America*; F. Lamson-Scribner: *Descriptions of New or Little-Known Grasses*; T. H. Kearney, Jr.: *A Revision of the North American Species of Calamagrostis*; A. Nelson: *New Plants From Wyoming*; E. O. Wootton: *New Plants from New Mexico*; C. L. Pollard: *Further Observations on the Eastern Acaulescent Violets*; C. H. Thompson: *A Revision of the North American Lemnaceæ Occurring North of Mexico, The Species of Cacti Commonly Cultivated Under the Generic Name Anhalonium*; C. D. Beadle: *Notes on the Botany of the South-eastern States*; C. F. Millspaugh: *Contribution III. to the Coastal and Plain Flora of Yucatan*; V. K. Chestnut: *The Principal Poisonous Plants of the United States*; W. N. Clute: *Flora of the Upper Susquehanna and Its Tributaries*; L. M. Underwood: *Selaginella Rupestris and Its Allies, The Ternate Species of Botrychium*. G. S. Jenman has continued his systematic work upon the ferns and fern allies of the British West Indies and Guiana; B. D. Gilbert: *A Revision of the Bermuda Ferns*; K. Muller: *Analecta Bryographica Antillarum*; A. J. Groat: *A Revision of the North American Eurhynchia*; M. A. Howe: *The Anthocerotaceæ of North America, New American Hepaticæ*; J. B. Ellis and B. M. Everhart: *New Species of Fungi from Various Localities*; C. H. Peck: *New Species of Fungi*; F. S. Earle: *New or Noteworthy Alabama Fungi*; C. G. Lloyd: *A Compilation of the Volvæ of the United States*; W. G. Farlow: *Some Edible and Poisonous Fungi*; P. Hennings: *On North American Fungi*; A. Schneider: *A Guide to the study of Lichens*; DeAlton Saunders: *Phycological Memoirs*; L. K. Rosenvinge: *A second memoir on the algal vegetation of the Coast of Greenland*; F. H. Knowlton: *A Catalogue of the Cretaceous and Tertiary Plants of North America*.

South America.—Among the works of the year bearing upon the botany of South

America, the principal are—*Fascicle 123 of Martius' Flora Brasiliensis*, consisting of a continuation of the treatment of the Orchidaceæ by A. Cogniaux; J. Arechavaleta: *The Grasses of Uruguay* (a book of 553 pages) and also a continuation of the *Flora of Uruguay*; A. Sodiro: *Plantæ Ecuadorensis I.* (descriptions contributed by Gilg, Schumann, Hallier, Lindau, and Pilger); R. Chodat: *Plantæ Hassleriana* (from Paraguay); G. Hieronymus: *Plantæ Stubelianæ Novæ*; H. H. Rusby: *An Enumeration of the Plants Collected by Dr. H. H. Rusby in South America 1885-86*; C. DeCandolle: *Piperaceæ Boliviana*, also, *Piperaceæ Sodiroana*; R. Keller; *On Central and South American Hyperica of Herb. Hauniense*; L. Radlkofer: *New Species of Sapindaceæ from South America*; H. Christ: *Ferns Collected in the Lower Basin of the Amazon by Dr. J. Huber*; K. Müller has described many new mosses from Brazil; A. W. Evans: *An Enumeration of the Hepaticæ Collected by John B. Hatcher in Southern Patagonia*; H. Rehm: *Contributions to the Fungus-Flora of South America*.

Botanical Societies.—The fourth annual meeting of the Botanical Society of America was held in Boston August 19 and 20, 1898, under the presidency of N. L. Britton. The address of the retiring President, J. M. Coulter, was upon *The Origin of Gymnosperms and the Seed Habit*. Nine papers were read. Officers for the ensuing year were elected as follows: President, L. M. Underwood; Vice-President, B. L. Robinson; Treasurer, Arthur Hollick; Secretary, G. F. Atkinson; Councillors, C. E. Bessey and W. P. Wilson.

The fiftieth anniversary meeting of the American Association for the Advancement of Science was held in Boston August 22-27, 1898, with W. G. Farlow as Vice-President and Chairman of section G (botany) and E. F. Smith as Secretary. Fifty-six papers were read, including a few by title only. The subject of Vice-President Farlow's address was: *The Conception of Species as Affected by Recent Investigations on the Fungi*. For the ensuing year, C. R. Barnes was elected Vice-President and Chairman of the section, W. A. Kellerman, Secretary.

At the meetings of the "Botanical Club" of the American Association for the Advancement of Science, held in conjunction with those of the section of botany, twelve papers were read. As officers for the succeeding year, the following were chosen: President, B. D. Halsted; Vice-President, F. H. Knowlton; Secretary, Stewardson Brown.

"The Society for Plant Morphology and Physiology" held its first scientific meeting with the American Society of Naturalists and the affiliated societies at Cornell University, Ithaca, N. Y., December 28 and 29, 1897. Its second meeting, also in conjunction with the societies mentioned, was held at Columbia University, New York City, December 28 and 29, 1898. The officers for 1898 were: President, W. G. Farlow; Vice-Presidents, J. M. Macfarlane, G. F. Atkinson; Secretary-Treasurer, W. F. Ganong. Dr. Farlow's presidential address was entitled, *Peculiarities of the Distribution of Marine Algae in North America*. The officers of the society for 1899 are: President, J. M. Macfarlane; Vice-Presidents, G. F. Atkinson, D. P. Penhallow; Secretary-Treasurer, W. F. Ganong.

The 1898 meeting of the British Association for the Advancement of Science was held in Bristol. Prof. F. O. Bower delivered the presidential address before the section of botany, dealing principally with the matter of *Alternation of Generations* in plants.

Botanical Gardens.—Much progress has been made during 1898 in the development of the New York Botanical Garden, which is destined to become an important factor in the botanical activities of America and of the world. Ground was broken early in the year for the Museum Building and the close of the year finds the great edifice, which is four stories in height and has a frontage of about 304 feet, nearly complete in outline. Ground has been broken also for the first and largest of the proposed horticultural houses.

Plans have been outlined during the year for the museum and conservatories in the Royal Botanical Gardens in Dahlem near Berlin. Miss Anne H. Cruikshank has given £15,000 for the formation and maintenance of a botanical garden in Old Aberdeen, Scotland.

Necrology.—The necrological list for 1898 includes the botanists Ferdinand Cohn, Anton Kerner von Marilaun, Axel Blytt, F. W. R. Suringar, Leopold Krug, François Gay, J. M. C. Lange, Emil Fiek, Emil Schmidt, Karl Nöldecke, Sven Borgström, Cav. Guiseppe Gibelli, T. Caruel, Ch. Kaurin, E. Lewis Sturtevant, and G. H. Hicks.

In conclusion, it may be affirmed that the year 1898 has been one of much activity and substantial progress in all lines of botanical investigation, and the contributions to the literature of the subject have been numerous and valuable.

BOUNTIES ON EXPORTS are granted by some governments for the purpose of encouraging the production and exportation of certain articles of commerce. The United States tariff act of July 24, 1897, in one of its clauses provided for the assessment of additional duty upon imported merchandise which had received a bounty from the country of production. In order

to carry out this provision the consular and diplomatic officers of the United States in foreign countries were requested to furnish information as to bounties granted by the several governments. The reports were sent in to the Treasury department and a summary of their contents was published in the United States Consular Reports for December 1898. The following is the list of countries and colonies in regard to which the consuls or other diplomatic officers reported that there were no enactments or ordinances conferring special grants or bounties upon any class of merchandise: Barbadoes, Belgium, British Honduras, Chile, China, Colombia, Dominican Republic, Ecuador, Leeward Islands, Morocco, Paraguay, Peru, Russia, Samoa, Society Islands, Sweden and Norway, Switzerland, Turkey, Venezuela. Some of these countries, however, indirectly stimulate certain industries by methods akin to the granting of bounties. The more common method is by the granting of drawbacks or rebates of the excise in the case of certain products which are exported. Thus in Belgium if a manufacturer of raw beet sugar declares to the excise department that from 3,850,000 pounds of beet juice he produces 2,204,600 of raw beet sugar each year, he is credited with a certain sum of money equivalent to a rate of \$8.68 for every 381 pounds of beet juice consumed, or 45 francs for every 100 kilograms of beet sugar produced. This law went into effect on August 15, 1898. The report from Russia shows that while there is no law establishing bounties on exports, the excise duty is remitted in the case of merchandise destined for export and the government reimburses exporters of cotton products for the customs duties paid on the materials used in their manufacture. There is also a rebate of the customs duties in the case of gold, silver, and gilded gimp. In Norway and Sweden the tax on the manufacture of whiskey is remitted when the whiskey is destined for export. In Sweden drawbacks are allowed on the following articles manufactured in whole or in part from imported raw materials when these articles are destined for exports: Sugar, chocolate, candy, bread, manufactures of tobacco, cotton, cotton and woolen yarn, cotton and linen cloth. Several countries like Ecuador, Nicaragua and Uruguay levy a tax on certain articles of export.

The countries reported as having bounties on exports are Argentine Republic, France, French West Indies, Germany, Haiti, Japan, Miquelon, and Netherlands. In these countries sugar is the principal product thus favored. The legislation of Argentine Republic confers a bounty on sugar alone. The law provides that all sugars produced in the country shall pay an internal tax of 6 centavos per kilogram, but that in exchange for this tax the executive power will deliver a certificate which will give the holder the right to export 35 per cent. of the sugar upon which he may have paid said tax, and to receive in return 12 centavos per kilogram for the amount exported. These certificates or drawbacks, however, will be withheld whenever the current wholesale price of sugar rises beyond a certain point, namely \$4.00 (Argentine currency) per 10 kilograms. France also grants sugar bounties at the rate of 53.461 cents per 100 kilograms (220.46 pounds) for raw sugars of the highest grade, that is, such as yield at least 98 per cent. in the case of beet root sugar or 97 per cent. for colonial sugars; and at the rate of 46.706 cents per 100 kilograms of refined sugar for the next lower grade, that is, when the raw sugar yields from 65 to 98 per cent. in the case of beet root sugar or from 65 to 97 per cent. in the case of colonial sugars. On candied sugars there is a bounty of 60.023 cents per 100 kilograms. The complex legislation in regard to sugar in the French West Indies has the effect of the granting of bounties, the rate varying according to the beet crop. In 1890-91 the rate was \$1.65 per 100 kilograms (220.46 pounds) of pure sugar. In the following year it was \$1.10 and in 1896-97 it was \$1.53. In Germany there is a direct export bounty only in the case of sugar, but indirect bounties through the remission of the internal revenue tax exist in the case of spirits and some other products. Haiti grants no bounty except on sugar and this article has not been exported in recent years, the small production being sufficient only for home consumption. Japan grants a bounty on prepared tea for the purpose of extending the market for that commodity. Of this bounty the greater part was to be applied in 1898 to the opening of markets and establishment of agencies in North America. In Miquelon the French government pays a bounty of ten francs (\$1.93) per 50 kilograms (110 pounds) on dry codfish destined for exportation. The legislation of the Netherlands permits only the granting of bounties on raw and refined sugars. The grant is not limited to the sugar exported but is accorded to all sugars leaving the factories or refineries as a general stimulus to production.

On June 10 an international conference in regard to a concerted policy on the part of the governments respecting sugar met at Brussels, Belgium, but was adjourned on June 25, having accomplished nothing of importance on account of the refusal of France and Russia to give up their policy of granting export bounties.

BOURGET, PAUL. See FRENCH LITERATURE (paragraph Fiction).

BOWDOIN COLLEGE, at Brunswick, Maine, was founded in 1794, is non-sec-

tarian but closely affiliated with the Congregational denomination, and is for men only. Since 1885 the president has been William DeWitt Hyde, D. D., under whose administration the college has greatly developed. The officers of instruction number about 32; the student enrollment in 1898 was: medical students, 140; seniors, 61; special students, 6; total, 383. The college is governed by fifty-four trustees and overseers. The bound volumes in the library number over 60,000. About one-half the college course is elective, and while the aim of the college is not specialization, opportunities are afforded for original investigation; no graduate instruction is given. In 1894 the college celebrated its centennial anniversary and dedicated the Walker Art Building, donated by the Misses Walker of Waltham, Massachusetts. It is a rectangular building of granite, limestone, and brick, surmounted by a dome, and has interior decorations by Messrs. La Farge, Vedder, Thayer, and Cox. Another building, given in the name of the late Mrs. F. S. Searles by Mr. E. F. Searles, was recently erected at a cost of about \$60,000 for the scientific departments. It is a three-story building, in Elizabethan style, of brick and stone, and contains lecture rooms and laboratories. Other recent gifts are the Fayerweather bequest of \$100,000, and the bequest of the late Mrs. C. M. Garcelon of Oakland, California; the latter to be divided equally between the college and the medical school, will become available about 1901. Both of these benefactions are for the scholarship fund. In 1896 a new athletic field was purchased and completed.

BOYS' BRIGADE, a movement started about 1884 by W. A. Smith of Glasgow, for "the advancement of Christ's Kingdom among boys and the promotion of habits of obedience, reverence, discipline, self-respect, and all that tends towards a true Christian manliness." The boys wear a uniform and have regular military drill. There are 2,850 officers and 35,000 boys in the United Kingdom; in the United States of America there are 550 companies with 25,000 boys; and in Canada, 120 companies with 4,500 boys.

BRADFORD is one of the most important manufacturing towns of England. It is situated in the West Riding of Yorkshire on a tributary of the Aire, and had an estimated population in 1896 of 231,260. Its trade with the United States has for many years been very important. The report of the American Consul dated January 14, 1898, showed an increase of nearly \$11,000,000 in the exports from Bradford to the United States during the calendar year 1897 over those for the year 1896. In 1897 the total amount of declared exports was \$24,471,035. The principal article was wool, next to which came worsted coatings, cotton goods, and wool tops. The exports during the year 1897 showed great fluctuations which are explained by the anticipation and realization of the Dingley tariff. Upon the passage of the new measure several of the former exports were discontinued.

BRAINE, DANIEL LAWRENCE, Rear-Admiral U. S. N. (retired), died in Brooklyn, New York, January 30, 1898. He was born in New York City May 18, 1829, was appointed midshipman in 1846, and the next year took part in the bombardment of Vera Cruz. In the Civil War, besides performing blockade duty he saw service in the engagements at Hatteras Inlet, Forts Caswell and Fisher, Rappahannock River, and Sewell's Point. Through bravery he became lieutenant-commander in 1863, and was at the fall of Richmond two years later. He became captain in 1875, commodore in 1885, and rear-admiral in 1887.

BRAZIL, the largest republic of South America, comprises twenty States and a federal district whose total area has been (1890) officially estimated at over 3,209,000 square miles, and whose population, according to the census of 1890, was more than 16,300,000. Amazonas and Matto Grosso are the two largest States, their areas being respectively 732,460 and 532,708 square miles; they are also the least populous, there being an average of less than one person to each five square miles. Minas Geraes has the most inhabitants, 3,184,000. The population is densest in Sergipe, where there are over 42 to the square mile, except in the federal district, where there are about 1,000 to the square mile. The capital is Rio de Janeiro, the population of which in 1892 was 522,031; other important cities are Bahia (pop. 200,000), Pernambuco (190,000), San Paulo (100,000), Belem (65,000), Porto Alegre (55,000), Parahyba (40,000), Maranhao (38,000), Ceará (35,000), Pelotas (30,000), Ouro Preto (22,000). The inhabitants in the seaports are chiefly of European descent; those in the northern provinces are to a great extent Indians, while the negroes are numerous in Rio de Janeiro, Bahia, Pernambuco, and Minas. Immigrants to the number of 860,991 entered Brazil from 1871 to 1892. Since the latter year the immigration through Santos, Victoria, and Rio de Janeiro has been: 1892, 86,513; 1893, 84,143; 1894, 63,294; 1895, 164,371; 1896, 157,948. The immigration of the last named year included 96,324 Italians, 24,154 Portuguese, and 11,366 Austrians and Hungarians. In Rio Grande do Sul there are fifteen colonies, with a total of 100,000 inhabitants, occupying 1,389,690 acres, of which 543,743 acres are under cultivation. The immigrants entering Rio de Janeiro in 1897 numbered 44,225, a majority of whom settled

ⁱⁿ Minas-Geraes. It was stated that 21,261 of them came voluntarily, while 22,964 received some kind of assistance. The males numbered 29,604 and the females 14,621. Various nations were represented as follows: Italy, 27,454; Portugal, 7,423; Spain, 7,253; Germany, 420; Russia, 392; Syria, 388; Armenia, 219; France, 215; Austria, 132; other countries, 329.

Government.—Each of the old provinces now constitutes a State, has the power of imposing export duties, and is administered at its own expense without interference from the Federal government, except for the maintenance of public order and the execution of Federal laws. The national Congress legislates upon matters of import duties, rates of postage, stamps, and bank-note circulation. According to the constitution, which was adopted in February, 1891, the executive authority is vested in a president, who is elected for four years by a majority popular vote. He must be a native of the country, must be over thirty-five years of age, and must not be "related by blood or marriage, in the first or second degree, to the actual president or vice-president, or to either who has ceased to be so within six months," and he is ineligible for the ensuing term. The president is assisted in the exercise of his functions by a cabinet, which is not responsible, and the ministers of which he appoints to the following six departments: Finance; justice, the interior, and public instruction; foreign affairs, industry, communications, and public works; war; marine. He also appoints, with the consent of Congress, the members of the Supreme Federal Tribunal and the diplomatic representatives, and has the highest authority over the army and navy. The President of the Republic for the term beginning November 15, 1898, was Senhor Don M. F. de Campos Salles.

The legislative authority devolves upon a Congress of two houses, a Senate and a Chamber of Deputies. The upper house consists of 63 members (three from each State and the Federal district) elected for nine years by popular vote, one-third retiring every three years. The deputies, 212 in number, are elected for three years, by direct vote, the proportion being not greater than one to every 70,000 inhabitants, but no State is represented by less than four deputies. The States have the following representatives: Minas Geraes, 37; São Paulo, 22; Espirito Santo, 22; Rio de Janeiro, 17; Pernambuco, 17; Rio Grande do Sul, 16; Ceará, 10; Federal district, 10. No member of Congress may hold another paid office except such as is military, diplomatic, or imposed by law, and he cannot be a member of the cabinet or be associated with any company subsidized by the government. Male citizens twenty-one or more years of age are legal voters, except illiterates, soldiers in actual service, beggars, and ecclesiastics under vows of obedience.

The constitution directs that the organization of each State be on the basis of republican government and provides for distinct and independent executive, legislative, and judicial branches. The governor and legislators are elective, but the judiciary appointive. There are, however, city magistrates and justices of the peace who are elected. Both for civil and criminal cases there are courts of first and second instance; there is a Court of Appeal at the capital of each State and a Supreme Court at Rio de Janeiro.

Finance.—The following figures, taken from the *Statesman's Year Book*, show in milreis revenue and expenditure (provisional for 1894-96 and estimates for 1897), according to official reports, balances from former year being omitted on both sides; the statistics for revenue do not include balance of deposits, proceeds of loans, and issues of nickel and paper money:

	1891	1892	1893
Revenue.....	228,945,070	227,607,092	259,850,981
Expenditure.....	220,592,463	279,180,219	291,311,070
	1894	1895	1896
Revenue.....	226,484,615	300,725,297	344,989,371
Expenditure.....	370,668,341	275,691,670	393,403,914
	1897		
Revenue.....	339,307,000		
Expenditure.....	313,169,790		

In the budget for 1898 the revenues were estimated at 344,197,000 milreis and the expenditures at 324,570,264; of the revenue import duties were estimated to amount to 250,000,000 milreis, and of the expenditure it was estimated that the department of finance would use 139,062,923. Among the other sources of revenue are railways (34,000,000 milreis), stamps, post and telegraphs, tobacco, duties, lottery taxes. The following statistics for the first six months of 1898 are derived from a report of the Brazilian director of public revenue. The customs amounted to 119,161,180 milreis, being 3,742,896 milreis less than the receipts for the first six

months of 1897, and 23,302,261 milreis less than the receipts for the corresponding months of 1896. The internal revenue receipts for the first half of 1898 and the two preceding years were: 1898, 5,984,314 milreis; 1897, 6,659,984 milreis; 1896, 8,579,018 milreis. The value of the gold milreis in United States currency is \$0.546.

The public debt in milreis on December 31, 1896, was reported by the Minister of Finance.

Internal, in paper and gold.....	635,698,500
External.....	313,447,333
Paper money in circulation March 31, 1897.....	371,641,023
Bank notes.....	340,714,370
Floating debt.....	274,278,081
Guaranteed debts	6,893,500
Total.....	1,942,672,807
Later debt,—Western Minas loan..... (£3,710,000)	34,189,926
Total.....	1,976,862,733

On the foreign debt the rate of interest varies from 4 per cent. to 4½ per cent., and on the internal funded debt from 4 per cent. to 6 per cent. The funded debts of the States in 1895 aggregated 85,027,659 milreis, and the floating debt 6,679,077 milreis, making a total of 91,706,736.

The Congress has undertaken to reduce paper circulation—which at the end of 1895 amounted to 683,702,000 milreis and at the end of 1896 to 712,355,394 milreis, by withdrawing notes, in 1897, at the rate of 10 per cent.; in 1898, 15 per cent.; and in 1899, 20 per cent. The amount of coin in circulation is small. In 1898 Brazil declared its intention of raising to 18 pence the greatly depreciated value of the milreis, which at par is worth 27 pence. The milreis was depressed by the introduction of forced currency until it had sunk to 6 pence, i. e., 100 gold milreis were worth 450 in paper. In 1888 the paper milreis was still at par (27 pence or \$0.5462), but declined so that in June 1898 it was worth \$0.147; it has a long way to travel in order to reach the desired valuation of 18 pence, or \$0.3653. Brazil adopted the gold standard in 1849.

Army and Navy.—In 1897 the standing army numbered 28,160 men, including about 4,000 officers; these comprised: 40 battalions of infantry, with 1 transport company and one depot company; 14 regiments of cavalry; 6 regiments of horse artillery and 6 battalions of foot artillery; 2 pioneer battalions of engineers. Since 1875 service in the army has been compulsory; three years are required in the active army and three in the reserve. About 20,000 men constitute the police force.

At the beginning of 1898 the navy was reported to consist of 2 third-class battleships; 1 first-class cruiser, 3 second-class cruisers, 2 third-class cruisers, and 10 smaller vessels classified as cruisers or gun-boats; 6 coast defense vessels, five of which are river monitors of from 340 to 470 tons; 8 first-class and 6 third-class torpedo boats, and small vedette craft. It was decided to increase the navy with 6 cruisers, 8 destroyers, 2 port-defense vessels, 6 first-class torpedo boats, and 2 submarine boats of the Goubet type. The cruiser *Almirante Abreu*, which was building, and the second-class cruiser *Amazonas* (3,600 tons) were sold to the United States just before the outbreak of the Spanish-American war. The following gives the classifications and displacement of some of the larger vessels: *Riachuelo* and *24 de Maio*, third-class battleships, 5,700 and 4,950 tons respectively (these vessels are English built, were completed in 1884 and 1885, are double turreted, and are protected with a steel-faced belt of armor having a maximum thickness of 11 inches); *Almirante Tamandare* (built in Brazil in 1890) and *Barroso* (built in England in 1896), second-class cruisers, 4,735 and 3,600 tons respectively; *Benjamin Constant*, third-class cruiser, 2,750 tons. The naval complement comprises about 8,900 officers and men. There are five naval arsenals at Rio de Janeiro, Bahia, Para, Pernambuco, and Ladario de Matto Grosso.

Industries and Commerce.—Although but a small portion of Brazil is under cultivation, it is essentially an agricultural country; it has immense resources in its forests and mines, both of which are yet but little worked, and manufacturing industries are increasing. Coffee is the chief product and other important ones are sugar, tobacco, cotton, rubber, timber, cacao, mate, nuts. The State of Pernambuco is prominent for its sugar production and in 1849 yielded 2,458,297 bags (175 kilos., 165 pounds); in Pernambuco are about 30 sugar factories showing an average capacity of about 160 tons of cane a day. The cattle industry flourishes in Rio Grande do Sul; cattle killed in 1895 numbered 280,000; in 1896, 215,000; in 1897, 320,000. There are in this State tanneries, breweries, canning factories, and evaporators. The production of rum and alcohol is increasing. The following figures regarding the coffee industry

were reported by United States Consul-General Seeger, for the fiscal year ending June 30, 1898:

Rio de Janeiro, per railroad, ship and in transit.....	598,949,428 pounds
Santos.....	812,142,408 "
Victoria (estimated).....	52,800,000 "
Bahia (estimated).....	33,000,000 "
Ceará (estimated).....	2,640,000 "
Total.....	1,499,531,836 pounds

Shipments to foreign countries were as follows:

Europe.....	770,233,776 pounds
United States.....	625,746,216 "
Cape of Good Hope.....	19,707,600 "
La Plata region, etc.....	13,402,356 "
Total.....	1,429,107,948 pounds

At an average price of \$8.75 a bag (60 kilos., 132 pounds) this export was valued at \$96,450,716. During the three calendar years preceding 1898 the coffee export was as follows:

	1895.	1896.	1897.
From Santos.....	3,554,696 bags	4,156,567	5,621,762
" Rio de Janeiro.....	2,763,720 "	2,784,958	4,066,734
" Victoria.....	307,438 "	273,255	372,221
" Bahia.....	264,775 "	260,981	292,480
" Ceará.....	20,202 "	6,000	6,568
Total.....	6,910,831 bags	7,418,761	10,359,765

The number of bags for the year ending June 30 1898, was 11,360,173. The great increase in production, shown by these figures, was brought about by an immense increase in the areas given to coffee cultivation. As a result prices fell heavily in 1898, bringing great discouragement to the planters. The crop for 1898-99 is sure to be much smaller than that of the preceding year, the official estimate being 7,000,000 bags and the commercial estimate 9,000,000.

Coal is mined in Rio Grande do Sul; the output in 1895 was 11,012 tons; in 1896, 18,300 tons. In Minas Geraes there are six prominent gold mines; five are controlled by English companies and one by a French company. Bahia also possesses gold and, in addition, silver, copper, zinc, lead, iron, manganese, mercury, and other minerals. Diamonds are found in Brazil, but their exploitation is not as remunerative as it was formerly.

About 100,000 milreis are invested in the cotton factories of Brazil, of which there are about 155, 43 of them being in the State of Rio de Janeiro and 35 in Minas Geraes. The persons employed number 200,000. There are large woolen factories in several States and in Rio de Janeiro two large flour mills and a silk mill.

The chief exports are coffee, sugar, cacao, rubber, and products of the herds of Rio Grande do Sul. The principal imports are cotton, woollens, iron and machinery, coal, flour and other provisions, wines and spirits. Import duties are very high, sometimes being from 80 to 120 per cent. of the value of the imports; on tools, machinery, agricultural implements, etc., the tax is small, but is very high on spiritous liquors, tobacco, matches, cotton, drugs, light cloths, and preserved provisions. The total value of exports from Brazil for 1896 is placed at 480,000,000 milreis, and of imports at 481,000,000 milreis.

Shipping and Communications.—In 1895 the merchant marine of Brazil comprised 189 steamers with a total net tonnage of 75,283, and 285 sailing vessels with a total net tonnage of 65,576. In December 1896, there came into force a law requiring all coasting and river vessels to be Brazilian. Companies engaging in such traffic under the Brazilian flag receive from the government subsidies aggregating about 2,810,000 milreis a year. The foreign shipping entered at Rio de Janeiro in 1895 and at that and other ports in 1896 was as follows: In 1895, at Rio, 1,460 vessels of 2,243,163 tons; in 1896, at Rio, 1,535 vessels with a total tonnage of 2,469,628; Pernambuco, 947 vessels of 1,181,247 tons; at Ceará, 308 vessels of 236,091 tons; at Maranhao, 174 vessels of 223,647 tons; at Rio Grande do Norte, 207 vessels of 51,890 tons—total for 1896, vessels, 3,171; tonnage, 4,162,503.

In 1896 Brazilian railways had a total mileage of 8,086; 5,403 miles were in process of construction, 4,670 were under survey, and 8,440 miles were to be surveyed. Of the lines in operation, 1,832 miles were Union lines, 3,000 miles under control of the

States, 2,259 were subventioned, and 995 non-subventioned. Upon the capital of most railways constructed the government has guaranteed interest usually at six or seven per cent. At the beginning of 1895 Union lines had cost in all 257,674,937 milreis, and the deficit paid out of the Federal treasury had amounted to 11,118,481 milreis. A law which authorized the leasing of government railways was promulgated in December 1896. The following statistics on Brazilian railways are taken from the extensive report of Mr. Frank D. Hill, United States Consul at Santos, under date of December 20, 1897. On December 31, 1896, the following railway lines were open to traffic and in process of building:

Railways.	Open to traffic.	Under Construction.
Federal government lines.....	1,982 miles	
Subventioned lines (subject to government inspection)	2,430 "	3,699
Lines not subventioned.....	990 "	384
Lines operated by the State.....	3,260 "	880
Total.....	8,662 miles	4,963

The effective capital of the 1,982 miles of government lines was 324,733,121 milreis (paper), or \$45,462,637 in United States currency. In 1895 the telegraph lines had a total mileage of 10,143, with 21,936 miles of wire and 289 officers; the receipts for 1897 were estimated in milreis at 3,600,000 and the expenditures at 9,844,722. In 1893 there were 2,826 post-offices.

Religion and Education.—Under the Empire the State church was Roman Catholic, but under the Republic Church and State are separate and all faiths are granted equal toleration; the Catholic ecclesiastics, however, receive appropriations from the government. The ratio of Catholics to non-Catholics in the State of Rio de Janeiro is about 100 to 1. "Brazil constitutes an ecclesiastical province, with a metropolitan archbishopric, the seat of which is at Bahia, 11 suffragan bishops, 12 vicars-general, and 2,000 curates. For the private instruction of the clergy there are 11 seminaries."

Public instruction is classified as primary, secondary, or preparatory; and scientific, or superior. Primary instruction, which is free but not compulsory in the States is controlled by State and municipal authorities and in the Federal district by the municipality. Few reliable data on public instruction from the States have been obtainable, but in 1889 it was officially reported that the public and private primary schools numbered 7,500 and the pupils in attendance 300,000. Secondary schools are private or are controlled by the States, and two, known jointly as the National Gymnasium, are under the management of the central government; this Gymnasium confers a degree. Superior education is directed by the Federal government; it consists, in part, of four law, two medical, one polytechnic, one naval, and four military schools, and a school of mines. In 1890 there were in attendance at these schools 2,916 students. There is a Lyceum of Arts and Trades having about 2,300 students, and five other special schools with a total attendance of about 600. At Rio de Janeiro there is an observatory and a school for astronomy and engineering. The constitution provides that all education be under lay management. About 84 per cent. of the population are reported as "illiterates."

Recent History.—In November 1896, a violent rebellion broke out in Bahia among what were known as the negro "fanatics;" it was led by Antonio Condeilheiro, a man of the most unsavory reputation, but one who wielded immense power at the head of his five thousand religious enthusiasts. Their enthusiasm, however, which was ostensibly religious, expressed itself largely in atrocious deeds of rapine and murder. The insurrection created great alarm throughout the province of Bahia, which was one of the most populous of the Brazilian States. Measures were forthwith taken by the government to suppress the fanatics, who early in 1897 strongly intrenched themselves at Canudos. During the greater part of the year hostilities existed between the two forces; the movements of the fanatics extended to other States, and numerous engagements were reported of which, unfortunately, there were no absolutely reliable reports. An encounter was reported to have taken place on February 21, 1897, in a State of Minas, and on March 7 a government force was said to have been ambushed in the State of Bahia and almost annihilated. These affairs increased the alarm of the government, and resulted in the strengthening of both forces, the force of the rebels increasing to an estimated number of 15,000 and the government ordering 6,000 troops to suppress the insurrection; at the same time martial law was proclaimed in the State of Bahia. The excitement extended to Rio de Janeiro, where considerable damage was done by rioters. Another serious engagement was reported to have taken place on June 7, when General Arthur Oscar gained a decided victory over the fanatics, but suffered a loss to his own force of 300 in killed and wounded. It was said that this battle resulted in the fall of Canudos, the stronghold of the fanatics, but on July 6 a still more severe engagement was reported to

have taken place between the fanatics and the government forces numbering 5,000 men under General Savagit, who was later reinforced by General Oscar with 6,000 men. This battle also took place at Canudos and does not seem to have resulted in a decided victory for either side. The astonishing announcement was made that the government forces lost 2,000 men killed and that the loss of the rebels was 1,500. Another battle, which was the fifth, was reported on September 26; it was said that after great losses on both sides, the rebels were repulsed; and the next month news came that *Conseilheiro* had been taken prisoner. The number of casualties given above is probably about twice the actual number.

In the latter part of 1897 a plot was brought to light by the attempted assassination of President Moraes by a soldier named Mello on November 5. In attempting Mello's arrest, General Bittencour, the Minister of War, was stabbed and killed. No uprising followed, but the confessions of Mello revealed a plot of considerable magnitude against the government, and martial law being proclaimed, many of the alleged leaders were arrested, most of whom, however, were released when investigation had been made, but some of the opposition leaders belonging to the Jacobin party were found guilty and were exiled.

Two other events aroused some comment in the latter part of 1897. The one was the assassination of a number of Italians by a company of Jacobins in November; this threatened to lead to international complications, but satisfactory explanations were made to the Italian embassy and a crisis thus averted. The other event was brought about by the action of the Congress in December, which adopted a new tariff schedule that seemed to involve needless changes and to be disadvantageous to Brazilian commerce.

Events of 1898.—The successful disclosure of the Jacobin plot and the punishment of the conspirators discouraged any insurrectionary movement which might very likely have taken place at the presidential election on March 1, 1898. Senhor Campos Salles was elected President to succeed Senhor Moraes. The new President was the governor of Sao Paulo, one of the most important States in Brazil; he has been of great service to the republic and is known to have held democratic ideas during the time of the empire. The Vice-President, Senhor Rosa e Silva, is represented as being an able man and as having achieved distinction in one of the cabinets of Dom Pedro.

Among the other events of the year may be noted the official statement made by the President upon the opening of Congress to the effect that payments on the foreign debt had been punctually made but at considerable cost owing to the political disturbances and the fall in the rate of exchange and in the price of coffee. An arrangement with a number of native and foreign banks for the guarantee of the conversion into 5 per cent. currency bonds of the 4 per cent. gold loan of 1890 was announced in June. A treaty was signed with France leaving the adjustment of the boundary dispute between Brazil and French Guiana to the arbitration of Switzerland and the ratifications relative thereto were exchanged on August 5.

BREMEN is a State and free city of Germany situated on the Weser about fifty miles from its mouth, and having a population in 1895 of 196,404 nearly all Protestants. Its commerce is very extensive, including trade with European countries, the United States of America, West Indies, Africa, East Indies, China, and Australia. A large number of emigrants are shipped from this port to the United States. The number of ships belonging to the State on December 31, 1896, was 313. There were 47 steamers belonging to the "North German Lloyd" navigation company which plied between Bremen and ports in North and South America, Eastern Asia and Australia. There were also 35 steamers belonging to the "Hansa" company and 29 to the "Neptune" company. In 1896 the value of the imports amounted to 821,472,143 marks (the mark being valued in United States gold at 23.8 cents), and the exports to 809,364,692 marks, a great increase as compared with the year 1858 when the imports were valued at \$41,185,000 and the exports at \$40,000,000. The United States Consular Reports for 1898 refer to the great progress in building that has recently been made in Bremen. The American merchants have not taken advantage of the demand for American goods as fully as they might, but in some branches the imports from the United States show a tendency to increase. This is especially true of the American pine and hard woods on account of the extensive building. Cotton is the most important article of import in Bremen, the trade in this article being more than double that of Hamburg and showing a constant tendency to increase.

BRICE, CALVIN STEWART, ex-United States Senator, died in New York City, December 15, 1898. He was born at Denmark, Ohio, September 17, 1845. At the outbreak of the Civil War he was a student at Miami University, Oxford, Ohio, and he enlisted in a university company but in the fall reentered college. He enlisted again in April 1862, in a similar company in the Eighty-sixth Ohio Infantry, serving during the summer in West Virginia, and again returned to Miami where he was graduated in June 1863. He went to Lima, Ohio, taught in the public schools, and

in 1864, having recruited a company, once more entered the Union service, as captain in the One Hundred and Eightieth Ohio Volunteers. He was attached to the Twenty-third Army Corps and served to the close of the war in Tennessee, Georgia, and the Carolinas. In 1865 he entered the law department of the University of Michigan and the next year was admitted to the bar in Ohio and was engaged in active practice until 1880. From 1876, when he was a presidential elector on the Tilden ticket, he was prominent in the Democratic party. He was a presidential elector again in 1884 and delegate-at-large to the Democratic national convention of 1888 and the next year was made chairman of the national committee. In March, 1891, he entered the United States Senate, succeeding Henry B. Payne. Though debating little he was prominent in the Senate, and in 1893-95 was chairman of the committee on Pacific railroads; later he was made chairman of the reorganization committee of the Union Pacific railroads. Mr. Brice acquired interests in a large number of railway and business corporations and devoted his attention largely to these after his retirement from law practice in 1880; among them may be mentioned the following companies: Lake Erie and Western; New York, Chicago, and St. Louis; Chicago and Atlantic; Ohio Central; Richmond and West Point Terminal; Richmond and Danville; South Shore and Atlantic; Virginia and Georgia; and the Knoxville and Ohio; also the Chase National Bank of New York, the Southern Trust Company, the United States Express Company, and the National Telegraph Company. His interests in corporations probably began when he and his law associates brought about the construction of the "Nickel Plate" railroad paralleling the Lake Shore. At the time of his death Mr. Brice was president and a director of the Duluth, South Shore, and Atlantic railway, the Lake Erie and Western railway, the Cincinnati, Jackson, Mackinaw railway, the Pacific Mail Steamship Company, and a director of a large number of other organizations. During the last months of his life he was interested in the construction of a railway from Hong Kong through Canton to Hankow on the Yang-tse-kiang. Mr. Brice's legal residence was Lima, Ohio, but he lived mostly in New York, Washington, and Newport.

BRICKS. See CLAY.

BRIDGES. The advance in bridge engineering during the past few years has been chiefly in better design and construction. Metal bridges are built with greater solidity and strength throughout than formerly; riveted connections and stronger details generally are employed; steel is the material now almost universally used; shopwork is more perfect and reliable, and the facilities for rapid and accurate erection are better. Greater durability has resulted from the increase in strength and weight. The various designs for bridges across the Hudson and East Rivers at New York, the St. Lawrence River at Quebec and Montreal, the Detroit River at Detroit, the Mississippi River at New Orleans and elsewhere have carried the possibilities of long spans beyond long accepted limits. Spans of over 3,000 ft. for suspension bridges are now regarded with confidence. In drawbridge construction there has been a notable development in the use of bascule spans where the waterways to be crossed are restricted in width and the land bordering their banks is costly. In masonry bridges the two most notable advances are the use of three-hinged arches and the development of various systems of combined concrete and metal construction. Wooden bridges are being replaced everywhere by structures in metal. Only the more notable typical bridges of the above types are mentioned here. Unless otherwise noted these bridges belong to the work of 1898. During this year many orders were received by American and European bridge manufacturers for bridges to be shipped to South America, South Africa, Japan, China and Asiatic Russia.

Arch Bridges.—A notable development in masonry arches has been the increasing use of concrete masonry. Concrete in which a skeleton of metal rods, beams, or netting is embedded is one of the systems of construction which has gained prominence. The largest structure of this type is the Topeka, Kan., bridge consisting of five 125 ft. spans, two 110 ft. spans, and two 97½ ft. spans. Each arch is of concrete in which are embedded 12 lattice girders of steel spaced 3 ft. apart and bent to the curve of the arch. Numerous shorter spans of this and other systems of concrete metal construction have been built in Europe and America. In constructing the extension of the West Highland Railway in Scotland many of the bridges and viaducts were built of concrete without metal skeleton. The longest single span employed was 127 ft., but most of them were 30 ft. and 50 ft. spans. The largest structure has twenty-one 50 ft. semicircular arch spans, and a length of 1,248 ft. Hinged arches of concrete have been built in considerable numbers in Europe. The hinges are sometimes true hinges of metal or stone placed at crown and abutments, and sometimes are simply joints of lead placed at crown and abutments and often, also, at the quarter points. The following are the most important hinged concrete arches actually built: Railways, Saxony, span 42.64 ft. rise 9.84 ft., thickness of ring 1.64 ft. to 1.96 ft., hinges sandstone with convex surface and concave bearing, built 1880; Munderkingen, Wurtemberg, span 164 ft., rise 16.4 ft., arch ring at crown, 3.28 ft.

thick, hinges of steel at crown and abutments, built 1893; Richtenstein, Württemberg, span 75.44 ft., hinges, lead joints at crown and abutments, built 1893; Inman, Hohenzollern, span 98.43 ft., rise 9.84 ft., hinges granite bushed with sheet lead, built, 1896. These bridges have given excellent service and developed no cracks. None were built in 1898.

Metal arches of unusual size have been built in the United States and Europe during the year. The two-hinged steel arch replacing the Niagara Falls and Clifton suspension highway bridge at Niagara Falls has a span of 840 ft. which is the longest in the world. The Grand Trunk Railway bridge located just below has a span of 550 ft., and is a double deck structure carrying a highway and two railway tracks. The notable features are: The inclination of the arch ribs toward the centre axis of the bridge at the crown; the use of riveted connections throughout with all bracing made up of stiff members, and the arrangement of the end shoes so as to form practically a pin 9 ft. in diameter and with roller friction. This bridge was completed in 1897. The Schuylkill river bridge in Fairmount Park, Philadelphia, has four 302 ft. arch spans. Two-hinged arches, with riveted connections and stiff bracing, were employed. The Alexander III bridge at Paris has a span of 352.6 ft. a rise of 20.6 ft. and a width of 131.2 ft. This is a three-hinged structure with solid web cast steel arch ribs. (See succeeding paragraph on Foundations). A parabolic open web arch with a span of 547.6 ft. was built at Muengsten, Prussia. A peculiar feature of this arch is that its lower panels are built into and form a part of the steel trestle towers or piers at the end of the arch. An open web arch of 380 ft. span forms a part of the new Kornhaus Bridge near Berne, Switzerland. The Bonn bridge across the Rhine in Germany has one arch of 614 ft., and two of 307 ft. each, and the Düsseldorf bridge over the same river two main arches of 594 ft. square each. Both of these were completed in 1898. The viaduct across the Viar river in France put under construction this same year has a centre arch of 721.6 ft. span.

Cantilever Bridges.—The first bridge of this type was built across the Niagara river in 1883; the longest is the Firth of Forth Bridge in Scotland with two 1,700 ft. spans; the longest in the United States is the Memphis bridge of 790½ ft. span. No notable bridges of this type were actually built during the year, but spans are projected as follows: Hudson river at New York, 2,100 ft.; Detroit river at Detroit, Mich., 1,300 ft.; Mississippi river at New Orleans, 1,000 ft.; St. Lawrence river at Montreal, 1,200 to 1,312 ft.; St. Lawrence river at Quebec, 1,440 ft. None of these structures has advanced beyond the preliminary plans.

Draw Bridges.—The majority of draw bridges built in recent years have been either swing spans or bascule spans, other forms being employed in isolated cases only. The swing span is still the form most used except in crowded cities and under special conditions, but undoubtedly the greatest development of the past few years has been in draw bridges of other forms. Of these some form of bascule span is the favorite with engineers at the present time. Notable bridges of this form have been built in Chicago, Milwaukee and Buffalo in this country. An 8-track bascule railway bridge is planned to cross the Drainage Canal in Chicago, and a six-track railway span of the same form is being erected at Boston. The Tower Bridge across the Thames river at London, England, having an opening of 200 ft., is the longest bascule span ever built and the Interstate Bridge, with a span of 520 ft., at Omaha, Neb., is the longest swing span. No very notable swing spans have been built during the last two years.

Foundations.—Among the notable bridge foundations of recent years those for the New East River Bridge in New York and the Alexander III Bridge in Paris are particularly noteworthy. The first mentioned work consists of both tower foundations and anchorages, the former for the Brooklyn tower being the most remarkable. These consist of two timber caissons each 63x79 ft., placed with their longer sides parallel and 97.5 ft. apart c. to c., and each carrying a masonry pier. The caisson for the south pier is 39 ft. high, contains 58,800 cu. ft. of timber and 86 tons of iron and weighs about 1,557 tons. It was sunk in 60 ft. of water. The cofferdam surmounting the caisson was 50 ft. high increasing the total weight to 1,960 tons. For the north pier the caisson was of the same lateral dimensions but it was 53 ft. high not including 50 ft. of cofferdam. This caisson contained 74,700 cu. ft. of timber, weighed 1,965 tons exclusive of the cofferdam, and was sunk in something less than 60 ft. of water. Bed rock was struck at a depth of 107½ ft. below water which with but one exception is the greatest depth ever reached by a caisson sunk by the pneumatic process. The caissons for the New York tower are similar but of slightly different dimensions, and both were practically finished in 1898. See succeeding paragraphs on Suspension Bridges.

The Alexander III bridge in Paris had for its abutment foundations two steel caissons each 144x110x31.7 ft. deep, which are the largest steel caissons ever sunk. Owing to the extended area of roof to be supported the working chamber of the caisson was divided into five great communicating compartments, each 144 ft. long,

by four lines of interior supports spaced 31½ ft. apart. The surface area of each caisson was 15,860 sq. ft. The working chamber was 6.23 ft. high in the clear and was surmounted by a roof of lattice girders 5.21 ft. deep, a covering of steel plates being riveted to the under sides of the upper chord of these girders. The exterior of the caisson was made of plates and cover plates each 6 mm. thick, the plates being 6.23 ft. high and 3.93 ft. wide. Above these were plates 4 mm. thick for 5 ft. and 3 mm. thick above that. There were two air lock shafts to each compartment or ten in all for each caisson. See preceding paragraph on Arch Bridges.

Suspension Bridges.—The longest span suspension bridge upon which construction has actually been begun since the completion of the New York and Brooklyn Bridge in 1883, is the New East River Bridge which will cross the East River between Manhattan and Brooklyn in New York City. This bridge will be located about two miles above the Brooklyn Bridge and it will have the following leading dimensions: Clear span, 1,600 ft.; length between terminals, 7,200 ft.; total width, 118 ft.; clear height for 100 ft. each side of centre 135 ft.; height of towers, 335 ft.; capacity, 4 trolley car tracks, 2 elevated railway tracks, 2 carriage ways, and 2 footwalks: four cables 17½ in. diameter of 19 strands of parallel 0.203 in. diameter steel wire; towers, masonry to 20 ft. above water, steel above. The platform will be carried by four riveted steel trusses suspended from the cables for the main span, but carried by the main towers and abutments and two intermediate towers for the shore spans. Work has been in progress since the spring of 1897 on the foundations which are being sunk by the pneumatic caisson process. (See preceding paragraph on Foundations.) The following are the chief points of difference between this bridge and the Brooklyn Bridge: The use of steel towers instead of masonry; the omission of all inclined stays; the support of the shore spans entirely independent of the cables; the use of riveted instead of pin connections for the trusses. Work on the steel superstructure will be begun in 1899.

The Lewiston & Queenston Suspension Bridge being built across the Niagara River at Lewiston, N. Y., has a clear span of 1,040 ft. between towers and of 800 ft. between the rocker bents at the ends of the platform. Its width is 28 ft. between trusses, and it will carry an electric railway and two carriageways. In constructing this bridge the cables removed from the old Niagara Falls and Clifton suspension bridge were re-employed. (See preceding paragraph Arch Bridges). It replaces a suspension bridge built in 1851, which was partly destroyed by a storm in 1864. This bridge will be completed in 1899.

The Covington and Cincinnati Suspension Bridge built by John A. Roebling in 1867 and, until the construction of the Brooklyn Bridge the largest and heaviest span of this type ever built has been strengthened and remodeled. The new work consisted in lengthening the approaches to reduce the grade; in constructing two additional cables with their anchorages, and in strengthening the platform construction. The new cables are 10½ ins. diameter made of 2,226 parallel 0.203 in. diameter steel wire and have a strength of 12,000 tons each. These cables are placed directly above and 6 ft. from the old cables, and the suspenders are attached to both the old and the new cables. Total cost of renewal \$650,000.

The Hudson river suspension bridges which have been proposed at various times call for spans of 3,000 ft. or over; the five most carefully worked out plans calling for the following dimensions:

Number of spans	1	2	3	4	5
Length land spans, ft.....	965	1,000	1,850	500	900
Length centre span, ft.....	5,220	3,200	3,100	3,310	3,200
Length between anchorages.....	5,150	5,200	6,800	4,310	5,000
Number of railway tracks.....	6	8	8	6	6
Load per lin. ft. lbs.....	3,000	1,500	3,000	3,000	3,000
Cost in millions of dollars.....	37	25	23	17	24

Surveys are being made for a third suspension bridge across the East River at New York.

Truss Bridges.—Several structures of note have been completed or put under way during the year. The Victoria Jubilee Bridge which replaces the Robert Stephenson tubular bridge across the St. Lawrence River at Montreal will have 24 spans of 254 ft. each and one span of 348 ft., all pin connected. Nearly 20,000 tons of steel were used in the new bridge as compared with 9,000 tons of boiler iron in the old tube. The Proposed Red River railway bridge in China for which French engineers have the contract will have a total length of 5,838 ft., divided into spans of 246 ft. with one span of 348 ft. The bridge to be built to carry the Central Asian Railway across the River Amu Daria in Russia will be nearly three miles long. Other truss bridges completed or under construction during 1898 are: Gray's Ferry Bridge, Philadelphia, Pa., with 26 spans, having an aggregate length of 1,650 ft.; Burnett

river bridge at Bundaberg, Australia, having eight lattice spans of 170 ft.; Charlestown bridge at Boston, Mass., having ten 85 ft. plate girder spans and a 240 ft. swing span, and the arch truss bridge of 25 spans of 65 ft. across the Manhattan valley in New York City.

BRIGGS, FRANK A., Governor of North Dakota, died at Bismarck, August 9, 1898. He was born September 15, 1858, in Hennepin county, Minnesota, near the present site of Minneapolis; was educated in the public schools and entered the newspaper business, becoming editor of the *Howard Lake Advocate*. In 1881 he went to North Dakota, having previously lived in Minneapolis. For eight years he was Treasurer of Morton county; was elected State Auditor in 1894 and Governor on the Republican ticket in 1896. Governor Briggs was well liked by the people, but on account of ill health he declined to have his name go before the Republican State convention for renomination.

BRIN, BENEDETTO, Italian Minister of Marine, died May 24, 1898. He was born in 1833; was educated at Turin, and having become a naval architect, soon gained distinction in the naval yards at Leghorn and at the Ministry of Marine. His reputation was increased by his construction of the great battleships *Dandolo*, *Lepanto*, and *Duilio*. Though it was as a naval architect that Signor Brin was pre-eminent, he was prominent as a statesman, being four times minister of marine and once minister of foreign affairs during the last twenty-two years of his life. It was said that, although he was an untiring lobbyist and controlled the majority of the votes in the Piedmontese deputation, he was a man of upright and generous character. He was loyal to the House of Savoy and to the Triple Alliance.

BRISSON, EUGENE HENRI, French Premier from June to October, 1898, is a well known statesman and a Radical Republican in politics. He was born at Bourges, July 31, 1835; was trained for the bar, but entered journalism, becoming a writer for the *Temps* and the *Avenir National* and becoming associated in 1868 with Gambetta, Allain-Targe, and Challemel Lacour on the *Revue Politique*. In 1871 he entered the Chamber of Deputies as a leader of the extreme left. He was a supporter of the colonial policy initiated by Jules Ferry. He was Vice-President of the Chamber of Deputies in 1879, and succeeded Gambetta as President in 1881, the latter becoming Premier. He was elected to the same office in 1894 and 1897; he retained the presidency from 1891 to 1895, when he succeeded Gambetta as Premier. On January 17, 1897, he was defeated for the presidency of the Republic by the late Felix Faure. M. Brisson has a praiseworthy record in French politics. For an account of the Brisson ministry in 1898, see FRANCE.

BRISTOL, one of the chief seaports of England is situated at the junction of the rivers Frome and Avon and partly in the counties of Gloucestershire and Somerset. Its population in the middle of the year 1897 was estimated at 232,242. It is the seat of an important college which in 1897 had a teaching staff of 56 and was attended by 583 students, including those attending evening classes. In 1896 the total tonnage of vessels entered and cleared excluding coastwise shipping, was 1,108,782. Since 1885 it has been represented by four members in Parliament. The municipal government is vested in a mayor, board of aldermen, town councillors, a lord lieutenant and a lord high steward. For an account of the trade union congress held there in 1898, see TRADE UNION, CONGRESS OF.

BRITH ABRAHAM ORDER, a fraternal society, founded in 1859. It has one grand lodge, 229 sub-lodges, and 15,461 members. Since its organization it has disbursed \$1,281,787 and \$82,200 during its last fiscal year. Samuel Doef, New York, Grand Master; Robert Strahl, Brooklyn, First Deputy Grand Master; Anson Stern, Boston, Second Deputy Grand Master; Leonard Leisersohn, New York, Grand Secretary; and Samuel Wolf, Brooklyn, Grand Treasurer.

BRITISH AND FOREIGN ANTI-SLAVERY SOCIETY, founded in 1839 for the "universal extinction of slavery and the slave trade; and the protection of the rights and interests of the enfranchised population in the British possessions, and of all persons captured as slaves." Patron, H. R. H., the Prince of Wales; Secretary, Travers Buxton, 55 New Broad street, London, E. C.

BRITISH ARMY. See GREAT BRITAIN.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, Burlington House, founded in York in 1831, at the suggestion of Sir D. Brewster to stimulate scientific inquiry and to promote intercourse among scientific men. There are ten sections: (a) Mathematics and Physics; (b) Chemistry; (c) Geology; (d) Zoology; (e) Geography; (f) Economic Science and Statistics; (g) Mechanics; (h) Anthropology; (i) Physiology; and (k) Botany. Each section has its president, secretaries, and committee. The Association meets annually. The last meeting, held at Bristol in September 1898, attracted 2,500 men of science under the presidency of Sir William Crookes, who showed by calculations that the amount of fixed

nitrogen is insufficient to meet the increasing demands made upon it by the production of wheat and proved that unless chemists discovered some way to fix the nitrogen of the atmosphere, a universal wheat famine would occur in the next century. The rest of his address treated of new cases—wireless telegraphy, the Röntgen rays, radiant matter spectroscopy, and psychic research. Prof. Ayrton described new researches in the physics of smell. Other interesting and valuable papers were read, among them the sensational adventures of M. de Rougemont, describing his alleged enforced exile of 28 years among cannibals in the Cambridge Gulf region of unexplored Australia. Prof. Petrie lectured on *Egypt under the First Three Dynasties in the Light of Recent Discoveries*. The Association will meet in Dover in 1899; in Bradford in 1900; and in Glasgow in 1901. President-elect, Prof. M. Foster, F. R. S.; Secretary, C. Griffith, Burlington House, London, W. See BOTANY (paragraph Botanical Societies.)

BRITISH CENTRAL AFRICA is that portion of Southern Africa which lies in the interior of the continent between Portuguese East Africa on the east and Angola on the west, having an area of about 251,000 square miles and a native population of about 650,000. British Central Africa proper has been since 1891 under the jurisdiction of the British South Africa Company, (q. v.) and is thus to be reckoned as a part of Rhodesia (q. v.). The European portion of the population is scanty, numbering between 300 and 400. A great part of the territory is uninhabited. Among the chief towns are Fife, Abercorn, Rhodesia, Niamkolo, Sumbu, and Fort Rosebery. The most populous portion of the territory is under British administration. The South Africa Company maintains a representative in this region.

BRITISH CENTRAL AFRICA PROTECTORATE is the district which lies on the southern and western shores of Lake Nyassa extending from that lake to the Zambesi. In 1891 this tract was set apart as a protectorate, while the adjoining territory, known as British Central Africa proper, passed under the jurisdiction of the British South Africa Company. The area of the Protectorate is placed at 38,000 square miles with a population in 1897 estimated at 844,995 natives and 300 Europeans. The principal town is Blantyre, which is the seat of an important mission. Other towns are Zomba, Chiromo, Port Herald, Fort Anderson, etc. Considerable progress has been made in recent years in the building of roads. Coffee planting has become an important occupation and it was estimated in 1896-7 that about 2,000 acres had been cleared and planted. Rice and wheat are also successfully cultivated and in certain parts of the country oats and barley are raised. The principal exports are ivory and coffee. To maintain order an armed force composed of about 200 Sikhs from the Indian army and a larger body of native troops is supported by the government. There are also gunboats on the rivers Zambesi and Shiré and on Lake Nyassa. By these means the efforts to protect life and property have been fairly successful. This region has been the scene of constant conflict with the slave traders. Missionary work has been actively carried on. Communication with the coast is afforded by means of the rivers but a more direct line will be opened when the railroad from Mombasa is completed. Post-offices have been established and a telegraph line is in process of construction.

BRITISH COLUMBIA. See COLUMBIA, BRITISH.

BRITISH GUIANA, a colony of Great Britain on the northeast coast of South America, comprising the settlements of Demerara, Essequibo, and Berbice. Its area, including the Venezuelan claim, is 109,000 square miles; population (1896-97), 285,315, the registered electors numbering 2,416. The capital, Georgetown, had (1891) 53,176 inhabitants. The government consists of a Court of Policy of seven official and eight elective members, a Combined Court comprising, besides the above, six elective financial representatives, and a governor (Sir Walter Joseph Sendall, K. C. M. G., being appointed in 1898 at a salary of £5,000). The Combined Court deals with matters of expenditure and methods of meeting it, and alone can levy taxes. Civil procedure is based on the Roman-Dutch Law, and the criminal on that of Great Britain. In the 209 schools there are about 28,300 pupils; these schools received (1896-97) a government grant of £20,883. Statistics of finance:

	1894-5	1895-6	1896-7
Revenue	593,285	567,749	555,774
Expenditure	566,833	596,493	590,616
Exports	2,039,901	1,769,500	1,899,457
Imports	1,668,750	1,443,553	1,341,710

The more important sources of revenue in 1896-7 were: Customs, £294,671; licenses, £108,859; rum duty, £49,780; royalty on gold, £23,902. Expenditures: Civil establishment, £156,718; judicial, £37,854; education, £31,431; public works, £23,800; ecclesiastical, £22,586. The public debt (1896-97) was £865,235. The more important

Exports (1896-97) were: Sugar, £1,098,398; gold, £466,143 (126,507 oz.); rum, £136,927; molasses, £20,926. Imports for same period: Rice, £131,458; flour, £103,956; dried fish, £53,652; oils, £29,478; pork, £26,739; lumber, £22,172; butter, £19,908. Exports to Great Britain (1896-7) amounted to £964,248, to British colonies, £55,670, to other countries, £879,538; the corresponding imports for the same period were respectively £783,697, £196,601, and £361,412. It is seen that sugar is the chief product; of the 79,278 acres under cultivation in 1891, 69,814 acres were used for that crop. The registered tonnage for 1897 was: Steam, 15 vessels of 1,171 tons; sailing, 121 vessels of 5,541 tons. Gold mining, which began in 1886, is a prosperous industry. Up to 1896 the returns aggregated £2,796,300; in 1895 there were mined 122,936 oz.; in 1896, 123,759 oz. The country has 70 post-offices, 36 of which are money order offices, and 42 telegraph offices with a total of about 546 miles of wire. There are 38¾ miles of railway and 450 miles of river navigation.

BRITISH HONDURAS, or **BALIZE**, a Crown colony of Great Britain on the Caribbean Sea east of Guatemala, has an area of 7,562 square miles and an estimated population (1896) of 33,811, of whom less than 500 are whites. Balize is the capital and chief town (pop. about 7,000). The colony is administered through a Governor (Colonel Sir David Wilson, K. C. M. G., in 1898) and an executive and a legislative council. The revenue for 1895 and 1896 was \$238,483 and \$302,686 respectively; the expenditure for the same years was \$274,767 and \$269,877. Revenue is mainly derived from customs duties, excise, etc., and expenditure is chiefly for administration. The public debt in 1896 was \$168,815. The principal products are mahogany and logwood; coffee and tropical fruits are cultivated. The exports for 1895 and 1896 amounted respectively to \$1,284,000 and \$1,378,601; the imports for the same years were valued at \$1,453,640 and \$1,462,637. In 1896 there entered 576 vessels of 178,199 tons, and cleared 562 vessels with a total tonnage of 170,867. In 1894 the United States gold dollar became the standard of value. The right of occupation by British settlers was formally acquiesced in by the Spanish authorities in 1798, but it was not until 1862 that Balize became a Crown colony. It was contended by some in discussing the Nicaragua Canal question that by establishing this colony England violated the Clayton-Bulwer treaty and that consequently this treaty is no longer binding on the United States. See **NICARAGUA CANAL**.

BRITISH MEDICAL ASSOCIATION, founded in 1832, has now over 18,000 members, 38 branches in the United Kingdom and 32 Colonial branches. The society publishes the *British Medical Journal*. Secretary, Francis Fowke; office 429 Strand, London, W. C.

BRITISH MUSEUM, Great Russell street, Bloomsbury, London, founded in 1753 opened 1759, has from time to time made so many additions that it now occupies thirteen acres. Originally it was composed of three departments: MSS., Printed Books (including coins, medals, points, and drawings), and Natural History. The Printed Book Department now contains about 2,000,000 books and receives a copy of every printed book published in the United Kingdom. The annual increase amounts to about 46,000 volumes, not including continuations, music, and newspapers. The National Library is the finest and most extensive collection of English literature in the world, and has the best library of every European language and literature outside of each individual country in Europe. In 1897 the number of visitors to the Museum (not including regular readers), was 586,437, the average daily number equalled 1,686, visitors to the reading room numbered 188,628. Some fine additions were made in 1898 to the Prints and Drawings Department. Officers for 1899, Sir Edward Maunde Thompson, K. C. B., Director and Principal Librarian; John T. Taylor; Assistant Secretary, and John C. Cleave, Accountant. Keepers: R. Garnett, printed books; E. J. L. Scott, MSS.; R. K. Douglas, Oriental MSS.; E. A. W. Budge, Egyptian and Assyrian Antiquities; A. S. Murray, Greek and Roman Antiquities; C. H. Read, British, Mediaeval and Ethnological Antiquities; Barclay V. Head, Coins and Medals; and Sidney Colvin, Prints and Drawings.

BRITISH SCHOOL AT ATHENS. See **ARCHÆOLOGY** (paragraph Greece).

BRITISH SOUTH AFRICA COMPANY, THE, received a royal charter on October 29, 1889, granting it extensive administrative powers over a wide tract of country to the north of Cape Colony. This region is now locally known as Rhodesia (q.v.) and comprises the divisions of Mashonaland, Matabeleland, British Central Africa, and the Bechuanaland Protectorate.

The Company and the Jameson Raid.—Previous to the Raid, Dr. Jameson was the administrative officer, but was dismissed from his position afterwards. The unlawful use of the Company's forces to invade a neighboring and friendly state

led to the transfer of military control to the imperial government. In January, 1896, the Company's directors asked the government to make an inquiry into the circumstances of Jameson's Raid. This request was complied with. Toward the close of the session of 1896 the House of Commons appointed a committee of inquiry, but it did not meet until the last day of the session and merely recommended the appointment of a committee on the same subject when Parliament should be convened. When the House of Commons assembled in January, 1897, Mr. Chamberlain recommended the appointment of a select committee to "inquire into the origin and circumstances of the incursion into the South African Republic by an armed force and into the administration of the British South Africa Company and to report thereon, and further to report what alterations were desirable in the government of the territories under the administration of the Company."

The Inquiry; Testimony of Mr. Rhodes.—The inquiry was opened on February 16, and Mr. Rhodes was the first witness examined. His testimony was very important. He admitted freely his responsibility for the Raid. He said that for a long time previous he had sympathized with the discontent manifested by the Uitlander element in the Transvaal—a discontent caused by a corrupt administration of the government and by the denial of civil rights "to the majority of the population possessing more than half the land, nine-tenths of the wealth and paying nineteen-twentieths of the taxes in the country." The Uitlanders had sought in vain to obtain redress for these grievances by constitutional means. Apart from a natural sympathy with their cause Mr. Rhodes said that as a citizen of the Cape Colony he felt that the unfriendly attitude of the government of the Transvaal was the great obstacle to common action among the states of South Africa. "Under these circumstances I assisted the movement in Johannesburg with my purse and influence," he said, "Further acting within my rights, in the autumn of 1895 I placed on territory under the administration of the British South Africa Company, upon the borders of the Transvaal, a body of troops under Dr. Jameson prepared to act in the Transvaal in certain eventualities. I did not communicate these views to the Board of Directors of the British South Africa Company. With reference to the Jameson Raid I may state that Dr. Jameson went in without my authority." He added that his action had been largely influenced by the feeling that the government of the South African Republic intended to call in the aid or appeal to the protection of another power, meaning of course the German Empire. Upon cross-examination, Mr. Rhodes showed perfect willingness to accept the full responsibility for the action of his subordinates.

Other Evidence.—Other important evidence taken by the committee of inquiry included Dr. Jameson's admission that in making the Raid he had acted entirely on his own judgment; and it was his expressed belief that if he had succeeded he would have been forgiven. He also denied that he had ever said to any one that the British government was behind him in what he did. Dr. Rutherford Harris testified that in a conversation with Mr. Chamberlain he had made a guarded allusion to an intended revolution in South Africa, but Mr. Chamberlain in his version of the conversation said that Dr. Harris had started to give him some confidential information but Mr. Chamberlain had refused to receive it. The charge made by Mr. Labouchère that Dr. Harris had dealt in the stock of the Company for personal gain was withdrawn, Mr. Labouchère's informants having refused to appear. Certain telegrams which were said to implicate persons in high authority were withheld by Mr. Hawksley, the solicitor of Mr. Rhodes, acting under authority from the latter and the committee did not compel their production alleging as a reason the delay which would result, since Mr. Rhodes would have to be summoned from South Africa to testify.

Report of the Parliamentary Committee.—The report of the committee was presented on July 13. The points upon which Mr. Rhodes dwelt in his testimony were first, the influence of the Uitlander grievances upon his conduct, second, the statement that Dr. Jameson invaded the Transvaal without the authority of Mr. Rhodes, third, the concealment of his actions from the Board of Directors of the South Africa Company. As to the first of these points, the committee said that the grievances in no way justified the action of Mr. Rhodes and Dr. Jameson. Secondly, the fact that Dr. Jameson acted on his own authority was admitted, and thirdly, it was the opinion of the committee that Mr. Rhodes had concealed his views from the Directors of the British South Africa Company. Notwithstanding this latter fact, however, the Board was not free from responsibility. To it the Imperial government had entrusted wide powers and it was bound to watch with care over the administration of its territory. It had given to Mr. Rhodes a full power of attorney and permitted him to act as he chose without consulting the Board. The committee therefore held that the Board as then constituted was not fitted for the duties for which it had been created, although it was declared that the High Commissioner Lord Rosemead had done everything in his power to maintain the honor of his

country. Blame was laid upon the Imperial Secretary to the High Commissioner and the Resident Commissioner in the Bechuanaland Protectorate for their failure to explain to the Board Mr. Rhodes's intentions. As to any complicity of the officers in the Colonial Office, the committee declared that there was no evidence. They did not believe that Mr. Chamberlain or any other of the officers in the Colonial Office had foreknowledge of the Raid.

Responsibility for the Raid.—The general conclusions of the committee were that Mr. Rhodes had acted without jurisdiction in promoting the Raid. He had subsidized, organized and stimulated an armed insurrection against the government of a friendly state and, although Dr. Jameson invaded that state without orders, he was acting in accord with a general plan for which the responsibility rested on Mr. Rhodes. The latter had been guilty of a great breach of duty. He had deceived the High Commissioner and had concealed his views from the Colonial Ministry, and from the Board of the British South Africa Company. Furthermore, he had led his subordinates to believe that their plans were contemplated and approved by their superiors. A share in this responsibility was attached by the committee to Mr. Alfred Beit and Mr. Maguire who had contributed large sums of money to the revolutionary movement, and to Sir Graham Bower, Imperial Secretary to the High Commissioner, and Mr. Newton, Resident Commissioner of the Bechuanaland Protectorate for having withheld from the Commissioner information on the subject of the conspiracy. The Raid itself was condemned by the committee in unqualified terms. "The result," it said, "caused for the time being grave injury to British influence in South Africa; public confidence was shaken, race feeling embittered, and serious difficulties were encountered with neighboring states."

Results of the Inquiry.—Upon the reading of the report in the House of Commons a long debate took place. Some of the members blamed the committee for its failure to recommend specific steps with regard to Mr. Rhodes, and to report immediately to the House the refusal of Mr. Hawksley to produce the telegrams. Mr. Labouchère was prominent in this criticism of the action of the committee. The government replied that it belonged to them to say what action should be taken in regard to Mr. Rhodes and that in this action regard must be paid to the services which he had rendered to the Empire. In regard to the failure to produce the telegrams, it was urged that a prompt report from the committee was most needful and no report could have been made during the current session had the committee waited to procure the telegrams. It was declared that the government had no intention of prosecuting Mr. Rhodes, who though he had committed a great fault as a statesman, was a man of high personal honor. As to a reorganization of the British South Africa Company in such a way as would remove present abuses, it was said that a plan was already under consideration and it was hoped that a new government would be established for Rhodesia which would be satisfactory in all respects. The resolution censuring the committee was voted down.

To carry out the rest of the government recommendations in this matter, namely the investigation of the affairs of the Company and its methods of administration, Sir Richard Martin was directed to investigate the recent doings of the Company's administrative officers in South Africa. He inquired into the causes of the uprisings in Matabeleland and Mashonaland and as a result held the Company largely responsible for these occurrences (see RHODESIA). He also declared that the Company had transgressed its charter in making a certain concession to a Mr. Homan to the injury of other traders; that its administration went beyond its powers in withholding licenses from other white settlers; that Dr. Jameson's withdrawal of the police gave an opportunity for the rising. The Company replied to these and other charges at some length denying some of them specifically and in general declaring that it was not responsible for the alleged grievances of the natives.

Affairs of the Company in 1898.—The above review of the question of the Company's complicity in the Jameson's Raid, though it concerns the events of previous years, is given for the reader's convenience and for a better understanding of the status of the matter in 1898. It was announced by Mr. Chamberlain in February 1898, that the Company had reimbursed the government for the costs incurred in connection with the Jameson Raid and with the native revolt in Rhodesia with the exception of some trifling amounts. Early in May one of the members of Parliament referred to the conditions prevailing in the Company's territories and drew the government's attention to the necessity of establishing a better system of government there. It was said in the course of the discussion that the Company's administration was unsatisfactory and that Mr. Rhodes ought not to have been allowed to resume his seat on the board. There was no guarantee, said Sir William Vernon Harcourt, that the government's plans for the administration of the colonies would prevent a recurrence of the former evils and he declared that the real administrator of Rhodesia would, in future, be Mr. Rhodes. Mr. Chamberlain said that the

government's plans would absolutely prevent the recurrence of the mistake made by the Company's administration. On being asked in regard to the restoration of their commissions to the officers who had taken part in the Raid it was said that eight of the thirteen officers had been discharged at the instance of the Attorney-General as having acted merely in obedience to orders and that the rest were permitted to resign their commissions. While the government admitted that most of the latter were to some extent victims of circumstance, it could not allow this in the cases of Sir John Willoughby or Cecil Rhodes. Nevertheless after Parliament was prorogued his commission was restored to Col. Rhodes.

BROAD IRRIGATION. See SEWAGE PURIFICATION.

BRODERICK, WILLIAM ST. JOHN FREMANTLE, P. C. English Parliamentary Under Secretary of State for Foreign Affairs, was born in 1856, being the eldest son of the eighth Viscount Midleton. He was educated at Balliol College, Oxford, (1879). He was Member of Parliament for West Surrey from 1880 to 1885, and has been Member for Surrey, Guilford Division, since the latter year. In 1895-98 he was Under Secretary of State for War and in October 1898 was appointed Under Secretary for Foreign Affairs, to succeed Mr. George N. Curzon, now Lord Curzon of Kedleston, the new Viceroy of India. In his official career thus far, Mr. Broderick has shown great industry, honesty and administrative power. His new position is the most responsible one outside of the cabinet.

BROOKE, JOHN R., Major-General, U. S. A. He was born at Pottsville, Pennsylvania, July 21, 1838. On November 7, 1861 he became a captain in the Fourth Pennsylvania Infantry; rose to the rank of colonel and of brevet brigadier-general for gallantry at the Wilderness and Spottsylvania; resigned from the service in February 1866: In July of that year he was appointed lieutenant-colonel of the Thirty-seventh United States Infantry, and was promoted to the colonelcy in March 1879. On April 6, 1888 he was made brigadier-general, and major-general on May 22, 1897. Upon the evacuation of Porto Rico, he was made military commander of that island, and was succeeded on December 5, 1898, by Brigadier-General Guy V. Henry. On the thirteenth of the month General Brooke was appointed civil and military governor of Cuba. See SPANISH-AMERICAN WAR (paragraph Campaign in Porto Rico).

BROOKLYN INSTITUTE OF ARTS AND SCIENCES originated in 1824 in the Brooklyn Apprentices' Library Association, which name was changed in 1843. The Brooklyn Institute was organized in 1887 and made rapid progress. The first section of the Museum Building was completed and opened in 1897. The building and its equipment cost \$335,500. During the first year, ending June 1, 1898, the attendance was 126,046. A second building in Bedford Park is used as an auxiliary to the main Museum. Admission to the museum is free, except on Mondays and Tuesdays. The hours are 9 A.M. to 6 P.M., every week-day; Thursday and Friday evenings 7:30 to 9:45, and Sundays, 2 to 6 P. M. A. A. Healy, President; Rev. R. S. Storrs, Chas. A. Schieren and Carroll H. De Silver, Vice-Presidents; G. C. Brackett, Secretary; William B. Davenport, Treasurer; membership, 5,832.

The institute has departments of instruction in which lectures are given on anthropology, archæology, architecture astronomy, botany, chemistry, domestic science, electricity, engineering, entomology, fine arts, geography, geology, law, mathematics, microscopy, mineralogy, music, painting, pedagogy, philately, philology, photography, physics, political science, psychology, sculpture and zoology. The library comprises 26,000 volumes. Connected with the institute, is the biological laboratory at Cold Spring, L. I., and the Westhampton summer school of art. In 1898 the Brooklyn Institute was granted \$20,000 by the city of New York. Annual income \$99,058. Permanent funds, \$232,153. In 1898 the membership was 5,417, and an attendance of 334,670 persons upon the various lectures.

BROTHERHOOD OF ANDREW AND PHILIP was founded in Reading, Pa., in 1888, the sole object being "the spread of Christ's kingdom among young men" by prayer and service, and had its first federal convention in New York city in 1893. It is composed of nineteen evangelical denominations: The Reformed Church in America, the Reformed Church in the United States, the Lutheran, the Church of Christ, the Progressive Brethren, Friends, United Evangelical, Baptists, Methodists, Presbyterians, etc., etc. There were at the close of 1898, 461 chapters with a membership of 14,000. *The Brotherhood Star*, the organ of the society, is published monthly in New York City. The president of the federal council is the Rev. R. W. Miller, also its founder; secretary and treasurer, Rev. C. E. Wyckoff, Irvington, N. Y. Its last meeting in 1898 was held in Baltimore, Md.

BROTHERHOOD OF ST. ANDREW, a Protestant Episcopal organization which originated in St. James's Church, Chicago, Ill., and began its work on St. Andrew's Day, 1883. It was started as a parochial organization solely, but was imitated in

various parishes in Chicago and other cities of the United States, until in three years thirty-five of these Brotherhoods of St. Andrew existed. In 1886 it was decided to organize. There are reported 1,220 chapters with a membership of about 13,000 men. *St. Andrew's Cross*, published in New York City, is the organ. Officers for 1899: President, James L. Houghtaling, Chicago, Ill.; Secretary, John W. Wood, New York; and Treasurer, John P. Faure. Brotherhoods of St. Andrew have also been organized in Canada, with 180 chapters and 2,000 men; and in Australia, with 40 chapters. Besides these, chapters have been formed in connection with the Scottish Episcopal Church and the Church of England.

The object is to "spread Christ's kingdom among men," and its rules are the rule of prayer, to pray daily; and the rule of service, to bring one man each week to church.

BROTHERHOOD OF THE KINGDOM, a religious society, founded in 1892, now consists of 100 members. Its object is "to apply the principles of the gospel to the thought and life of to-day, and thus to re-establish the idea of the kingdom of God in the thought of Christians, and to assist in its practical realization in the world." Leighton Williams, Secretary, 312 W. 54th street New York.

BROTHERS OF NAZARETH, ORDER OF, a charitable and religious order, incorporated in 1890, for industrial, educational, and preventive work among boys, and for the care of the poor and suffering. It maintains: All Saints' Pavilion for Convalescent Men and Boys, St. Paul's Training School for Boys, and St. Andrew's Cottage, Farmingdale, L. I., "a fresh air home" for poor boys. Brother Gilbert is the superior. Headquarters, Mother House, Priory Farm, Verbank, Dutchess Co., N. Y. Rt. Rev. H. C. Potter, visitor; Rev. John W. Brown, D. D., New York, President; Richard Stevens, Hoboken, N. J. treasurer; and Donald McLean, New York, secretary.

BROWN, Rev. THOMAS MCKEE, rector of the Protestant Episcopal Church of St. Mary the Virgin, New York City, died December 19, 1898. He was born in Philadelphia, Pennsylvania, in 1841; was graduated at Trinity College, Hartford, in 1864, and at the General Theological Seminary, New York, the following year. After the death of Rev. James De Koven, D. D., he was recognized as the leader of the ritualistic movement. He was the founder of the New York Catholic Club, and, with Bishop Grafton, of Fond-du-Lac, Wisconsin, of the American branch of the Confraternity of the Blessed Sacrament, and was one of the founders of the Guild of All Souls, the object of which is intercession for the repose of the souls of the dead.

BROWN UNIVERSITY, at Providence, Rhode Island, was founded in 1764. It is non-sectarian, but is closely affiliated with the Baptist denomination, and is co-educational, the Women's College being not a corporation by itself, but a department of the university. Besides the usual academic and scientific departments, there are courses leading to the degrees of C. E. and M. E. No other professional degrees, however, are conferred. In 1898 the library contained about 100,000 volumes; the officers of instruction for the year 1898-99 numbered 79; and there were 925 students, including 99 graduate students and 165 in the Women's College. The degrees conferred in 1898 besides four honorary degrees were as follows: B. A., 70; Ph. B., 50; M. E., 6; M. A., 24; Ph. D., 2. The university conducts a system of university extension. In 1898 President E. Benjamin Andrews, LL. D., resigned to become superintendent of schools in Chicago, and Professor Benjamin Franklin Clark, Sc. D., was president *ad interim*.

BRUCE, BLANCHE K., Register of the Treasury of the United States, was born a slave in Prince Edward county, Virginia, March 1, 1841, and died in Washington, D. C., March 17, 1898. Having served in various positions of political trust, including the Federal Senatorship from Mississippi, he was appointed to the office of Register of the United States Treasury under President Garfield in 1881-5, was re-appointed by President McKinley, December 2, 1897, and was holding the office at the time of his death. On March 24, 1898, the President nominated as his successor Mr. Judson Lyons of Georgia. Mr. Bruce was one of the foremost Republicans in the south, and was the first colored man elected to the United States Senate.

BRUNEL. See BORNEO.

BRUNETIERE, FERDINAND. See FRENCH LITERATURE (paragraph Criticism).

BRUNSWICK, DUCHY OF, is a State of northern Germany with a population on December 2, 1895, of 434,213, of whom the great majority belonged to the Lutheran Church, the Roman Catholics numbering only 16,419 at the census of 1890. The chief crops are oats, wheat, rye and beet-root. Mineral products, including salt, are obtained in considerable quantities. In the beginning of 1897 the public debt amounted to 27,408,738 marks (the mark in United States gold being between 23 cents and 24 cents). The budget estimate for 1897-98 was 13,750,000 marks. The constitution dates from 1832 but was modified in important particulars by the fundamental laws of 1851 and 1888. The legislative body consists of one chamber composed of repre-

sentatives and meeting every two years. Executive authority is vested in the duke, who is aided in the government by responsible ministry of state consisting of the departments of (1) State Foreign Affairs and Finance, (2) Justice and Ecclesiastical Affairs, and (3) the Interior. In 1898 the ruler was Prince Albrecht, who was chosen regent in 1885.

BRUSSELS, the capital of Belgium, is situated on a tributary of the Dyle. It has canal connection with Antwerp and the Baltic sea and railway connection with the principal towns of Europe. Its population on January 1, 1896, was estimated at 531,011 including the suburbs. It is the seat of an important university, which during the academical year 1895-96 was attended by 1,265 students. In 1895 preparations were made for widening and deepening the canal which connects the city with the Scheldt river and for constructing a commodious harbor. According to the plans discussed in 1897 it will pass through the plain of Thurn and Taxis and new docks will be built in the very heart of the city. See BELGIUM.

BUBONIC PLAGUE. See INDIA, paragraph Plague; PUBLIC HEALTH.

BUCKWHEAT. The following table published by the Department of Agriculture shows the acreage, production and value of buckwheat in the United States in 1898:

BUDDHISM. See RELIGIONS.

BUELL, General DON CARLOS, a well-known veteran of the Civil War, died at his home near Rockport, Kentucky, November 19, 1898. He was born on the site of Lowell, Ohio, March 23, 1818. Upon his graduation at the West Point Military Academy in 1841, he was assigned to the Third Infantry; served in the Florida and Mexican wars, being wounded at Cherubusco, and was brevetted captain and major. From 1848 to the breaking out of the Civil War he was an assistant adjutant general, but in 1861 he became a lieutenant-colonel, and on May 11 of that year was appointed brigadier-general. He assumed command of a division of the Army of the Potomac in August, and the following November succeeded General W. T. Sherman as commander of the department of the Ohio. In 1862 Buell was made major-general of volunteers and his troops in his campaign in Kentucky and Tennessee were known as the Army of the Cumberland. This campaign was begun early in the year, and the long marches of the men under Buell have been recognized as a remarkable military feat. He occupied Bowling Green, on February 14, 1862, Gallatin, Tenn., on February 23, and Nashville two days later. The next month he took part in the battle of Shiloh. In the following July the Confederate General, Bragg, began so vigorous a campaign against Buell that the latter fell back; charges were preferred against him and a military investigation was ordered by the Washington government. Buell's army was compelled by Bragg to abandon Lexington and Frankfort and finally to evacuate central Tennessee and retire to Louisville. Upon this General Thomas was ordered to succeed (September 30) to Buell's command, but the latter was restored on the same day, and thereupon began an advance against Bragg, whose forces he met in the battle at Perryville, October, 8. The Confederates withdrew and the apparent remissness of the Union general in not taking advantage of the situation led to his being superseded by General Rosecrans and to the appointment of a commission for the investigation of his conduct. His trial, which was begun November 24, 1862, was not ended until May 10, 1864, and the commission's report has never been made public. On June 1, 1864, General Buell resigned from the army. According to an act of Congress in 1895 he was appointed a major-general and retired as such at full pay. At one time he was interested in coal mining, but his enterprise was finally unsuccessful. He was also president of an iron works corporation. President Cleveland appointed him pension commissioner. Despite some patent military shortcomings, General Buell had many of the qualities of a great soldier. He did much toward keeping Kentucky true to the Union, he rendered most valuable aid to Grant at Shiloh, he did most excellent work in training the Army of the Cumberland. He was firm and self-controlled and had "a certain stately dignity and reticence," while his courtesy has been called that of "a gentleman of the old school."

BUILDING STONES. The value of building stones produced in the United States in 1897 was:

Granite	\$8,905,075
Marble.	3,870,584
Slate	3,524,614
Sandstone	4,065,445
Limestone	14,804,943
Bluestone (est'd).....	900,000

The 1897 report of mineral resources issued by the U. S. Geol. Survey contains much information concerning the building stones of the United States, as well as a detailed account of the Bedford, Ind., limestone so much used for building at the present day.

Vol. II, Md. Geol. Surv. in addition to a special report on the building stones of that State, contains a valuable report on the physical, chemical and economic properties of building stones.

BULGARIA was created by the treaty of Berlin in 1878 an autonomous principality tributary to the Sultan of Turkey. Its area, including Eastern Roumelia which was united with Bulgaria in 1885 and is now sometimes called Southern Bulgaria, is 37,560 square miles and its population on January 1, 1893, was 3,309,816, of whom 2,504,336 were Bulgarians, 569,728 Turks, and the remainder in the order of their numerical importance Greeks, Gypsies, Jews, Germans and Russians. Its capital is

Sofia with a population in 1893 of 47,000. The majority of the people are engaged in agriculture, the soil in some parts being very fertile. The chief crop is wheat which is largely exported. There is also an important trade in other grains and in live stock and in animal products. The state owns the minerals and works the coal mines. There are manufactures of woolens, cottons, cord, cigars and cigarettes. Bulgaria carries on a considerable trade with the other European countries; with the United States its trade is small. In 1897 there were signs of an increased interest in railway building and plans for several new routes were proposed. Foreign goods entering Bulgaria are liable to customs duties and to certain octroi taxes. Bulgaria has treaties of commerce with several foreign nations and in 1898 the government applied to other countries the rates of import duty established by the commercial conventions with Great Britain, Austria-Hungary, Italy, France and Servia. The constitution dates from 1879 and was amended in May 1893. It vests the legislative authority in a single chamber called the Sobranje, whose members are elected by universal manhood suffrage in the proportion of one to 20,000 of the population. There is also a Great Sobranje consisting of representatives elected on the basis of one to 10,000 of the inhabitants and having authority to decide upon proposed changes in the constitution, and matters of supreme national importance. The constitution vests the executive authority in the Prince and in a council of eight members nominated by him, these members being the executive heads of the ministries of foreign affairs and public worship, the interior, public instruction, finance, justice, war, commerce and agriculture, and public works. The reigning Prince is Ferdinand of Saxe-Coburg, who was elected by the national assembly in 1887, the election being confirmed by the Porte and the great Powers in 1896. The state religion is the orthodox Greek faith to which the majority of the people belong. Attention was drawn to Bulgaria in 1897 on account of its supposed design to interfere in the Græco-Turkish difficulty, but it was soon seen that the government had no intention of giving aid to the Greeks. In August, 1897, Prince Ferdinand visited the Sultan and it was supposed that a closer and more friendly relation would follow between the principality and the Porte.

Political and Economic Progress.—In August 1897, Bulgaria celebrated the tenth anniversary of the accession of Prince Ferdinand. A French writer in 1898 gives a brief review of the progress of Bulgaria during this period of ten years which may be of interest here as serving to explain the present conditions of the country. It will be remembered that a year passed before a successor to Prince Alexander of Battenberg was found, and that Ferdinand of Saxe-Coburg though chosen by the national assembly of Bulgaria, was not acceptable to Russia. Nevertheless, he ascended the throne in 1887 and applied himself to the difficult task of governing a people divided by party passions and thrown into confusion by a long period of political conflicts and foreign war. His position was embarrassing, for not only was the government of Russia opposed to him, but he could not count upon the confirmation of his election on the part of the other powers of Europe, and if he were not recognized by the latter it was questionable whether the Porte would admit his rights as Governor-General of Eastern Roumelia. These were some of the difficulties with which he had to deal in the domain of foreign affairs, and the domestic situation was equally grave. In the first place there was a party which cherished the friendship of Russia and was naturally hostile to the Prince whose election had been opposed by that power. Moreover, during the period of interregnum the high-handed policy of M. Stambouloff had greatly angered a large portion of the people and yet it was difficult for the new prince to break off with Stambouloff at once, since the latter represented what stable authority there was in the principality. During the first part of the reign Prince Ferdinand applied himself to a study of the country and of the political parties. This preparatory period may be said to have lasted until 1894, when the time came for definite action. The policy which the Prince decided upon was separation from Stambouloff and his party and reliance upon the more moderate party. By this time it appeared that the majority of the people had ranged themselves on the side of the Prince and he thought he was strong enough to overthrow the unpopular Minister. The fall of Stambouloff followed and the control of affairs was entrusted to the moderate party. The way was now open to a reconciliation with Russia, especially after the death of Alexander III, for the new Emperor had not been at all concerned in those events in the past which divided political opinions in Bulgaria. Thus one important question,—the relations of the Prince to Russia,—was answered in a manner favorable to the wishes of the latter state. Another question was that involving the status of Eastern Roumelia. When the Sultan recognized Prince Ferdinand as Prince of Bulgaria, he merely conceded his right as Governor-General of Eastern Roumelia, the latter country remaining nominally a dependency of the Porte. Nevertheless the union of Eastern Roumelia with Bulgaria was accepted by the great powers, and the slight tie between the former and the Porte was in effect broken, although the fiction of immediate dependence upon Turkey was maintained.

The third important matter was the Macedonian question. Macedonia, it will be remembered was included in the limits of Bulgaria by the treaty of San Stefano, and the Macedonians, of whom a large part are Bulgarians, have joined with the latter in their demands for religious autonomy. It was important to the Bulgarians of Macedonia that the bishops, who were the official representatives of their religion in Turkey, should be members of their own race. The Bulgarian government took the Macedonian side of this question, and in 1890 and 1894 induced the Porte to issue letters patent to Bulgarian bishops in the Macedonian dioceses.

These are some of the successful results of the reign: in fact, during the ten years from 1887 to 1897 what no one would have predicted actually came to pass. The Prince not only was accepted unanimously by the Bulgarian nation, but he was recognized by all the powers and treated as an independent sovereign. His own state, moreover, attained a far higher degree of civil harmony than it had before possessed and seemed at the end of the period to be on the high road to prosperity.

Among the signs of progress noted by the writer above mentioned was the improvement of the finances, which appears to have taken place in spite of occasional deficits. The government strictly fulfilled its financial obligations and the debt was not increased in spite of the fact that the construction of the railways exceeded the means afforded by the ordinary resources. In 1897 the railway mileage in Bulgaria was nearly doubled, and the state possessed nearly two-thirds of the entire mileage, and three times as much as it possessed in 1887. The government has also tried to promote maritime development. The postal and telegraph service greatly improved during the period, and telephone lines were constructed between Sofia and Philippopolis, and between Sofia and Rustchuk. The development of Bulgarian commerce and industries also received especial care, and in 1893 a new ministry known as the ministry of commerce and agriculture, was established. Since then a great number of laws have been passed for the encouragement of commercial and industrial enterprises, including the establishment of chambers of commerce and industries, the exemption of imposts for certain enterprises, and the advancement of industrial and agricultural education. It was reported in 1897 that the number of factories had more than doubled in the principality within the decade. Although private capital is still scanty, credit hard to obtain, and interest high, private enterprise has on the whole increased. Many new companies have been formed, including insurance companies, banks, and saving institutions. One sign of progress has been the great increase of the population of the capital, Sofia, which numbered 20,000 in 1881, and 45,000 in 1893. There has also been a considerable increase in the other important cities, especially Varna and Rustchuk.

Events of 1898.—On January 4, 1898, letters patent for the Bulgarian bishoprics at Monastir, Divra and Strummitza were granted by the Sultan. Prince Ferdinand's visits to the Czar in 1897 and 1898 were taken as a further sign of the growing friendship between the two governments, and his offer in 1898 to reinstate the twenty-one officers who had taken part in the conspiracy against his predecessor, Prince Alexander, strengthened this impression. Trouble on the Macedonian frontier disturbed Bulgaria in the spring of 1898, and the government complained to the Porte of the barbarities committed by Turkish troops in the attempts to disarm the people who had shown sympathy with the movement for Macedonian independence. On August 11th there was a meeting at Sofia of a congress of the Macedonians in Bulgaria. On the basis of the project of reform drawn up by the Central Macedonian Committee, the following changes were demanded: (1) The formation of a single province of Macedonia comprising the three vilayets of Monastir, Uskub and Salonica; (2) the appointment of a governor-general belonging to the race and religion predominant in the province; (3) the election of a provisional assembly with the power of voting the budget; (4) the creation of a provincial militia.

BUREAU OF AMERICAN ETHNOLOGY. See ANTHROPOLOGY.

BURGESS, A. M., Commissioner of Dominion lands, died at Ottawa, Ontario, February 25, 1898. He was born in Inverness-shire, Scotland, October 21, 1850. For some years he was a journalist, being connected with the *Toronto Globe* and subsequently with the *Ottawa Times*. He was made secretary of the interior department in 1882 and in 1883 its deputy head.

BURMAH, is a part of the Indian Empire stretching from the confines of Thibet on the north to China on the east and Siam on the southeast. On the south and west it is bounded by the Indian provinces of Bengal and Assam and by the ocean. It has an area variously estimated at from 171,430 square miles to 280,000 square miles, the lower estimate being the more recent, and a population in 1891 of 7,605,560. It consists of the old province of Lower Burmah and the province of Upper Burmah, which was annexed by proclamation in 1886. It is governed as a part of the Indian Empire by a lieutenant-governor appointed by the Viceroy. It has a fertile soil and abounds in mineral deposits including cop-

per, lead, iron, tin, jade, amber, ruby, marble, coal and small quantities of gold. The majority of the inhabitants are Buddhists. It is separated from Indo-China by the Shan States, the boundary between the territories of Great Britain and France being fixed by agreement in January 1896, along the Mekong river. The development of the railway system has been rapid in recent years. In 1896 Messrs. Rothschild & Sons announced the formation of the Burmah Railways Company with a capital of £2,000,000. This syndicate acquired several lines already open to traffic and set to work to build new ones. In 1897 the work on the Mandalay-Kunlou railway was carried on and it was announced that it would be complete in 1899. At the beginning of 1898 it was reported that 1,148 miles of railway were officially sanctioned, 887 miles being open for traffic. In 1897 the status of the country was raised to the rank of a local government under a lieutenant-governor, aided by a legislative council of nine members. For the year ending March 31, 1896, the revenue was Rx 5,922,279 and the expenditure Rx 4,217,712.

BURNE-JONES, SIR EDWARD COLEY, A. R. A., English artist, died suddenly in London, June 17, 1898. He was born at Birmingham, August 28, 1833; received his elementary education at King Edward's grammar school, from which he entered Exeter College, Oxford, in 1853, but did not take a degree until 1881, when he received an honorary D. C. L. from Oxford and an honorary fellowship in Exeter College. He began his art career in London in 1856; instead of going to an academy he taught himself, and soon came under the influence of Dante Gabriel Rossetti, from whom he received much help and with whom he came to constitute a part of the romantic (pre-Raphaelite) school. He received an election to the Royal Academy of Arts in 1885, and in 1887 he assisted in establishing the New Gallery of Art. In 1895 he was made a baronet. Besides his prominence in oil work, Burne-Jones was accounted a master in stained glass designs and in mosaic. The draughtmanship in some of his early paintings is not perfect, but they show a wonderful mastery in vivid coloring; in his later works the drawing is very superior, while the coloring is more subdued, greys and light purples being predominant. In almost all of his pictures there is an atmosphere of poetry, a suggestion of the unreal, of fairyland, and yet from another point of view they express true realism. His line of imagination lay along "the beautiful and mysterious borderland" of the worlds of actuality and of dreams. Burne-Jones, moreover, was both an idealist and a conscientious, persistent, painstaking worker. He had high ideals of work and duty. "Our work," he said, "must be the best of its kind, the noblest we can offer." And most of his, indeed, was noble and the best of its kind. At the time of his death it was said of him that he "has bequeathed to us in the last quarter of a century a greater heritage of beauty than any other English painter has done." Burne-Jones was not only a great craftsman, a master of technique, but he was a man of high and serious aspirations, a man of real spirituality. His large conception of an artist's work may be felt in the following words, which are his: "To be a great painter a man must also have a great spirit. He must be a dreamer, and not ashamed of his dreams; must, indeed, account them of paramount worth; he must be prepared for both indifference and hostility; he must be so continent of his faith that he will not barter the least portion of it in order to win a worthless approval; he must be so proud that he will disdain to prostitute his genius to a public use; he must be so single hearted that, like Sir Galahad, there can be for him only one Sanc Grael—beauty, and only one quest—the lifelong, insistent effort to discern and interpret in beauty, that Loveliness, that Beauty, which is at once his inspiration, his dream, his despair, and his eternal hope."

Among his principal works are: "Annunciation and Nativity," in St. Paul's, Brighton (1861); "The Merciful Knight" (water color, 1864); "The Wine of Circe" (water-color, 1867); "The Days of Creation"; "The Wheel of Fortune"; "Pygmalion and the Image"; "Aurora"; "The Mirror of Venus"; "Love among the Ruins" (water color, 1873); "Laus Veneris" (1873-5); "The Beguiling of Merlin" (1877); "Le Chant d'Amour" (1878); "The Golden Stairs" (1880); "King Cophetua" (1884); "The Depths of the Sea" (1886); "The Brazen Tower" (1888); "The Legend of the Briar Rose" (1890).

BURNS, Rev. WILLIAM, D. D., born in Kingston, Ontario, 1840; died at Galt, Ontario, January 2, 1898. He was secretary of the aged and infirm ministers' fund of the Presbyterian Church in Canada, and for some time was secretary of Knox College, Toronto.

BUTLER, CHARLES, LL. D., president of the council of New York University, died December 13, 1897. Born February 15, 1802, at Kinderhook Landing (now Stuyvesant), Columbia county, New York, he was educated at the Greenville (New York) academy, and, without receiving collegiate training, entered the law office of Martin Van Buren, and in 1824 was admitted to the bar. In 1835, the year before Van Buren's election to the presidency, Mr. Butler took up the practice of law in New York City, and in 1836 became a member of the council of New York University.

THE UNINTERPRETED DREAM.

Completed picture by Sir Edward Burne-Jones. By kind permission of the Blakeslee Galleries, New York.

He was interested in the Michigan Southern, Chicago and Northwestern, and Chicago and Rock Island railroads. Until the time of his death he was a patron of New York University. His honesty of purpose, generosity, and foresight did much to bring success to the university, and he lived to see many of his far-reaching plans realized or in process of realization. Mr. Butler did much toward organizing various philanthropic movements in and about the city. He was one of the founders of the Protestant Half Orphan Asylum and of Union Theological Seminary; to the latter institution he gave \$100,000 to found the Edward Robinson chair of Biblical theology. He gave a like amount to New York University.

BUTLER, Major-General MATTHEW CALBRAITH, was appointed by President McKinley, August 16, 1898, a member of the commission to arrange for the evacuation of Cuba by the Spaniards. He was born about sixty years ago; was a captain of Confederate cavalry in the Civil War and attained the rank of major-general. He lost a leg at Brandy Station. In 1870 he was the Union Reform candidate for governor of South Carolina. He returned to the Democratic party and by it was elected to the United States Senate for the term beginning in 1877; he was returned for the next two terms, his last term expiring in 1895.

BUTTERWORTH, BENJAMIN, United States Commissioner of Patents, was born in Warren county, Ohio, October 22, 1822, and died in Thomasville, Georgia, January 16, 1898. From the Civil War to the time of his death he was well known in politics and public affairs and was a man of great popularity. He was educated at Ohio University, Athens, and after studying law in Cincinnati was admitted to the bar in 1861. He had a creditable record for service in the Civil War. In 1870 he became United States district-attorney, and was elected to the United States Senate for 1873-74. For five terms he served as a Republican Congressman from his native State, his first two terms beginning in 1878 and the last three in 1884. In 1883 President Arthur appointed him to the office of Commissioner of Patents, to which position he was reappointed by President McKinley in the spring of 1897. He will be remembered as the author of the compulsory army retirement act.

BYRNES, THOMAS JOSEPH, Premier and formerly Attorney-General of Queensland, died September 27, 1898. He was born at Brisbane in 1860; was educated at Brisbane Grammar School, and Sydney and Melbourne Universities, becoming a barrister in Victoria in 1884. In the following year, however, he began practicing in Queensland, and in 1890 entered the legislative council as solicitor-general.

CAIRD, JOHN D. D., LL. D., Principal and Vice-Chancellor of Glasgow University and prominent Scottish minister in the established church, died July 30, 1898. He was born at Greenock, Scotland, in December 1820; was educated at Greenock Grammar school and at the University of Glasgow, at which he was graduated in 1845; the same year he was ordained minister of Newton-on-Ayr. In 1847 he became minister of Lady Yester's Parish, Edinburgh, and two years later went to the parish of Errol, Perthshire. Here he remained until called to the Park church, Glasgow, in 1857. He was appointed professor of divinity in his *alma mater* in 1862 and in 1873 became Principal and Vice-Chancellor. For some time he was one of Her Majesty's chaplains for Scotland. He was not prominent in strictly ecclesiastical matters. Among his publications are the following: *Sermons* (1858); *Unity of the Sciences* (1873-74); *Introduction to the Philosophy of Religion* (1880); *The Religions of India*; *Brahmanism and Buddhism* (1881); *Spinoza* in Blackwood's *Philosophical Classics* (1888).

Dr. Caird was accounted one of the very foremost preachers in Great Britain; his sermon entitled *The Religion of Common Life* achieved world-wide fame and, though published in 1855, has by no means drifted out of the public mind. As a preacher he was intense, magnetic, and powerful; he was a profound theologian and clear thinker, and yet, for depth and originality, he can not be classed with the first rank of theologians and speculative thinkers. Dr. Caird belonged to the progressive school of Scotch Presbyterians, and as far back as 1862, when he was called to the divinity professorship he was suspected by some of unorthodox tendencies. The task which he took upon himself, and which he accomplished, was the successful exposition of a philosophical Christianity; it was a difficult task, indeed, to make clear to the sternly "orthodox" Scottish mind a religion interpreted in terms of German philosophy, especially that of Hegel. Although German philosophy has very little in common with the rigid Calvinism of Scotland, John Caird preached with such enthusiasm and at the same time with such tact and cleverness that his hearers seldom realized that they were being taught a neo-Hegelianism. As an instructor and as principal of Glasgow, his influence was very great, though in this country he was known hardly as well as his brother, Edward Caird, LL. D., master of Balliol, Oxford, and author of *The Critical Philosophy of Immanuel Kant*. Upon the death of Dr. John Caird, the *London Spectator* said "On the one side stood the Scottish kirk with its great and rigid doctrinal system, on the other . . . literary

and human tendencies . . . rich in their appeal to the young and generous mind. It would seem to have been the primary task of John Caird to reconcile the two possibly conflicting tendencies by a philosophic interpretation of Christianity, shed of impossible dogmas and allied to reason and to the progressive forces of society. For a generation John and Edward Caird had under their hands the intellectual and theological training of the youth who were to pass into the pulpits of the Established, Free, and United Presbyterian churches of Scotland, and they imbued the minds of these nascent Scottish pastors with reasonable and philosophic Christianity which has powerfully affected Scotland, and, through Scotland, the whole English speaking world." The orthodoxy of Scotland to-day is "of a new type, consistent with freedom of criticism and with brighter hopes as to the destiny of man than those furnished by Knox and Calvin."

CAIRO, the largest city of Egypt, had according to the census of June 1897, a population of 570,062. For an account of the scheme for a railway to connect Cairo with the Cape. See the articles "CAPE TO CAIRO" RAILWAY SCHEME and AFRICA.

CALCUTTA, the capital of the province of Bengal and the metropolis of India, lies on the west bank of the river Hoogly, a branch of the Ganges about 100 miles from the sea by the river. In 1891 it had with its suburbs, exclusive of Howrah, a population of 861,764. It is the seat of an important university, which in 1896 was attended by 2,308 students. It is a great center of trade. The foreign commerce is naturally for the most part with Great Britain and her colonies. It is the great distributing point for Bengal. The cotton and jute trade is especially important. The report of the American Consul in 1898 stated that about 99 per cent. of the trade in cotton piece goods and yarn was controlled by the United Kingdom. At the same time the recent establishment of a direct line of steamships from Calcutta to New York promises to promote the trade with the United States. Some American brands of cotton goods have already been introduced and the trade shows signs of improvement. The jute industry suffered temporarily from the official announcement that the plague existed in Calcutta, and about 250,000 people are said to have left the city, thus causing a scarcity of labor, but the deaths from the plague were comparatively few and the people soon recovered from their panic. In the year 1896-7 the imports from the United States increased in value on account of the large quantities of grain shipped to India to meet the necessities arising from drought and famine. This especial stimulus to imports being removed, the total value of the imports from the United States fell off in 1897-98 but the general condition of trade between the two countries was much improved. The exports to the United States were higher than they had been for a number of years. Among the important articles imported from the United States to Calcutta may be mentioned kerosene and lubricating oils, the imports of which have greatly increased during recent years. Another item of importance is American steel rails. The chief item of the exports from Calcutta to the United States is jute and the exportation of jute manufactures has steadily advanced until in 1897-98 the figures reached the highest point on record. The next item of importance is hides and after this come raw jute, indigo, lac, saltpetre, tea, etc. The trade of Calcutta with Germany has also increased and the same is true of its trade with Austria-Hungary, Italy and Belgium, but with Russia and France the trade seems to have declined. See INDIA.

CALDERON, PHILIP HERMOGENES, R. A., Knight of the Legion of Honor, a prominent artist, died in London, England, May 1, 1898. He was born of Spanish parentage at Poitiers, France, in 1833, was educated at Leigh's School of Art, London, and the atelier of M. Picot, Paris. He was made an Associate of the Royal Academy in 1864 and an Academician three years later. From 1887 to the time of his death he was Keeper of the Royal Academy. His first exhibit at the Royal Academy was "By the Waters of Babylon," 1853. After that time he exhibited: "Broken Vows," "The Gaoler's Daughter," "Lost and Found," "The Young Heir's Birthday," "La Demande en Mariage," "After the Battle," "The British Embassy in Paris on St. Bartholomew's Day," "The Burial of John Hampden," "Her Most High and Puissant Grace," "Home After Victory," "The Orphans," "On Her Way to the Throne," "Home They Brought Her Warrior Dead," "Refurnishing," "Les Coquettes," "Arles," "On the Banks of the Clain near Poitiers," "The Olive," "The Vine," "The Flowers of the Earth," "Night," "Morning," "Summer," "Aphrodite," "Andromeda," "St. Elizabeth of Hungary," "Elizabeth Woodville Parting from her Son, the Duke of York," "Ariadne," "Spring-time;" many portraits, water colors, etc.

CALIFORNIA, an extreme western State of the United States with a land area of 155,980 sq. m. Capital, Sacramento.

Mineralogy, etc.—During 1898 operations in the petroleum region of Southern California, especially in Los Angeles county, reached the extent and excitement of a positive boom. A large amount of capital and many experienced operators from New York, Ohio, and Pennsylvania were attracted to the newly discovered fields.

The richest veins were found in the suburbs of the city of Los Angeles, particularly to the north. In 1895 there were 22 oil wells in operation in all of Southern California; in October, 1898, there were over 700, of which 443 were in the outskirts of Los Angeles City. Nearly \$1,000,000 of capital was invested in the industry there, and at that time the production was about 7,500 barrels per day. An interesting feature of the oil excitement was the fact that the Southern Pacific and the Atchison, Topeka, and Santa Fé railroad companies changed the locomotives on their Pacific divisions from coal to crude oil burners because of the greater cheapness of the oil. In February, Wells, Fargo & Co. estimated the yield of gold mines in the State during 1897 at \$18,817,876, and of silver mines at \$12,948, making the aggregate nearly \$1,000,000 more than the mint estimate. Nevada county still led in the production, with an output of about \$2,500,000, making its total since the discovery of gold \$212,000,000. A number of new finds were made during the year, especially in Shasta, Calaveras, San Bernardino, Trinity, Los Angeles, and Kern counties. In the last-named county, the discoveries of gold in 1897 led to the organization of several new mining towns, of which Randsburg and Johannesburg became the most notable during 1898. Unusual attention was given to river bed mining, which has had a more important development in California than in any other part of the world. In Shasta county there was a marked revival in copper mining. The copper belt was found to begin at Iron Mountain and to follow a northeast course in a semicircle for 25 miles. Several large companies, including New York, Berlin, and Düsseldorf syndicates, were exploiting this belt from end to end. The scarcity of sulphur for powder-making in the early part of the war with Spain led to explorations which seemed to show that under proper development the Pacific coast would yield sufficient sulphur for the government and commercial purposes to do away with the necessity for importing it from Sicily. There are deposits of immense extent in the Cocopale Country, about 60 miles south of Yuma, which have only just begun to be worked. Recent developments have shown that sulphur in paying quantity can be mined in Ventura, Colusa, and Kern counties, and that the deposits extend into Nevada and Arizona. See ASPHALTUM and PLATINUM.

Greater attention is being paid to the proper storage of water in mountain reservoirs and dams. The water flowing from the Sierra Nevada Mountains is being used, for the production of electricity. In addition to the old mining fields, work is now progressing on quartz lodes in Del Norte, Siskiyou, and Shasta counties. In the latter also, copper mines are developing, as well as in Madera and Plumas counties. River dredging is an increasing factor in the mining, especially on the upper Sacramento. The coal production during 1898 was 136,454 tons.

Agriculture.—The principal farm products and values reported for the calendar year 1898 were: corn 1,184,040 bushels, \$734,105; wheat, 12,224,405, \$8,801,570; oats, 1,943,304, \$971,652; barley, 9,164,746, \$5,957,085; potatoes, 1,939,710, \$1,066,840; rye, 360,711, \$252,498; and hay, 2,335,854 tons, \$33,285,791—total value, \$51,069,541. The growth of the prune industry is one of the marvels of the State. Against the prune orchards of 10 and 12 acres each in France and Italy, which are there considered large, there are a dozen in the Santa Clara and Sacramento Valleys that comprise more than 120 acres and 12,000 trees each. In 1880 there were less than 4,000 acres of prune orchards in the State; in 1890 there were 13,000 acres and 1,300,000 trees planted; and in 1897 there were 53,000 acres of bearing trees. About \$20,000,000 is now invested in the industry, and the annual product is over \$100,000 in value. The farm and ranch animals reported were, Dec. 31, 1898: horses, 342,265; mules, 52,915; milch cows, 318,425; oxen and other cattle, 664,704; sheep, 2,175,545; and swine, 374,141—total head, 3,927,995.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise at the ports of Humboldt, Los Angeles, San Diego, and San Francisco amounted in value to \$43,498,645, and the exports to \$41,972,054. The trade in gold and silver ore, bullion, and coin was, imports \$28,348,306, and exports \$10,733,171—making the total foreign trade of the year \$124,552,176.

Banking.—On October 31, 1898, there were 34 national banks in operation and 17 in liquidation. The active capital aggregated \$10,825,000; deposits \$30,273,077; and reserve \$12,364,116. The State banks on August 31 numbered 176, and had a capital \$31,139,301, deposits \$67,224,396, and surplus \$17,159,017; the private banks numbered 23, and had capital \$964,027, deposits \$1,517,323, and surplus \$235,681; and the stock savings banks numbered 55, and had capital \$7,941,930, depositors 176,241, deposits \$136,119,226, and surplus \$6,588,868. The exchanges at the United States clearing houses in San Francisco and Los Angeles, in the year ending September 30, 1898, aggregated \$871,119,631; increase in a year \$108,810,694.

Railroads.—A new importance was given to the railroad systems of the State by events growing out of the war with Spain, and the fact was recognized by the United States Commissioner of Railroads, who in his official report for the year ending June 30, 1898, suggested that the government construct and operate a first-class double-

track railway from Kansas City, Mo., to San Diego, Cal., by air-line route. This would open the shortest line, measured by the map, from Boston, New York, and Philadelphia to the Pacific coast, and make the most direct route from our great commercial centres to the Sandwich and Philippine Islands. The principal railroad construction of the year was for the purpose of connecting new or recently developed mining districts with the main lines of roads traversing the State. Congress, in July 1898, appointed a commission to settle the indebtedness of the Central Pacific and Western Pacific railroads to the government, growing out of the issue of bonds to aid their construction. During the year the government received \$40,253,605, the balance of the indebtedness to it of the Union Pacific railroad, and \$6,303,000 for its mortgages on the bond-aided portion of the Kansas Pacific railroad, both under legal procedure. The two last roads have an intimate connection with the transportation interests of California.

Education.—At the close of the school year 1896-7 there were 257,929 pupils enrolled in the public schools, of whom 188,849 were in daily attendance. The value of all public school property was \$17,196,996, and the expenditures of the year, including \$4,418,545 paid to 7,178 teachers for salaries, aggregated \$5,847,748. There were 86 public high schools, with 390 teachers and 10,793 pupils; 62 private secondary schools, with 293 teachers and 2,111 pupils; and 4 public and 4 private normal schools, with 71 teachers and 1,657 students. For higher education there were 12 colleges and universities, co-educational and for men only, with 317 professors and instructors and 4,558 students; 2 colleges for women only, with 52 instructors and 83 students; and 4 theological, 2 law, and 6 medical schools. The agricultural and mechanical department of the University of California at Berkeley, endowed by Congress, received from the Federal government \$22,000 in 1897 and \$23,000 in 1898. In the last year there were 684 periodicals, of which 112 were dailies, 454 weeklies and 93 monthlies.

Finances.—The total assessed valuation in 1897 was \$1,130,911,181, the lowest since 1890, and the tax rate was \$4.90 per \$1,000. The rate for 1898 was fixed at \$4.88. On March 1, 1898 the total bonded debt was \$2,282,500. There were also special bonds aggregating \$600,000 not included in the regular debt statement because payable from special receipts. The State held in trust for various educational funds \$2,277,500 in bonds of the regular debt and \$200,000 in those of the special.

Population.—As estimated by Federal officials the population on June 30, 1898, was about 1,550,000.

Events of 1898.—The fiftieth anniversary of the discovery of gold in California was celebrated at San Francisco by a week's festivities, commencing Jan. 24th. The city was gaily decorated with flags and bunting and the portrait of James Marshall, who picked up the first gold nugget in 1848, was seen everywhere. A proclamation of Governor Budd's made the day a holiday. A monster parade took place and the Golden Jubilee Mining Fair, showing the mining products of every county in the State was opened. The State suffered somewhat from drought, Tuolumne county especially suffered from lack of water. An earthquake on March 31, caused great damage in San Francisco.

The Republican State Convention reaffirmed its belief in the financial plank of the Republican National platform of 1896 and commended the efforts of the national administration to secure an international monetary agreement, and urged that the attempt should be renewed at every opportunity. The candidates for Governor were: Maguire (Fusionist), Gage (Rep.), McComas (Pro.), and Herman (Soc. L.). H. T. Gage was elected by 19,411 plurality and six of the seven Representatives sent to Congress were Republicans. McGuire's single tax theories contributed to his defeat. In the State legislature the Republicans have a majority of twelve in the Senate and thirty-six in the House. The Insurance Commissioner attempted to secure for the people, from the foreign insurance companies doing business in the State, an equitable reduction of insurance rates, payment of taxes and licenses by insurance companies, and a general abolition of conditions imposed on insurers after the fire underwriters had combined. In June the foreign companies finally accepted the commissioner's regulations for doing business in the State. The California law, passed March 13, 1897, was declared unconstitutional by the Supreme Court of that State in March 1898, on the ground of violation of the secrecy of the ballot. The law provides for an "open" primary. "As each voter approaches to vote, when it is ascertained that he is entitled to vote, it shall be noted in the register by the clerk in which box he votes by writing in the register, opposite his name, the name of the box in which he votes." As this register is public, the secrecy of the ballot is practically done away with. Of the constitutional amendments submitted to the people in 1898 only one out of seven was adopted. This related to the lieutenant-governorship. The proposal for the summoning of a constitutional convention was rejected. The President issued proclamations on March 2 and June 28 setting apart the Pine Mountain and Zaca Lake Forest Reserve and prohibiting settlement.

National Representatives and State Officers.—The Representatives for California

are: John A. Barham (Rep.), Marion De Vries (Dem.), Victor Metcalf (Rep.), Julius Kahn (Rep.), Eugene F. Loud (Rep.), Russell J. Waters (Rep.), and James C. Needham (Rep.). The Senators are: George C. Perkins (Rep.), and another Republican. The officials are: H. T. Gage, Governor; J. H. Neff Lieutenant-Governor; C. F. Curry, Secretary; T. Reeves, Treasurer; E. P. Colgan, Comptroller; J. T. Ford, Attorney-General; T. J. Kirk, Superintendent of Education; M. J. Wright, Commissioner of Public Lands. Chief-Justice Supreme Court, W. H. Beatty; Associates, T. B. McFarland, C. H. Garoutte, R. C. Harrison, W. Van Dyke, F. W. Henshaw, and Jackson Temple. In the State Legislature there are 84 Republicans, 33 Democrats, 2 Populists, and 1 Independent.

CALIFORNIA, UNIVERSITY OF, at Berkeley, California, was established in 1868; it is non-sectarian and co-educational. The university comprises: at Berkeley, the academic department and the department of mechanics, mining, and civil engineering, and a college of commerce; at Mount Hamilton, the astronomical department (Lick Observatory); at San Francisco, the colleges of art, law, medicine, dentistry, pharmacy, and veterinary science. In 1898 the officers of instruction numbered 300 and the students 2,391. Of these there were in the departments at Berkeley 107 teachers and 1665 students; at Mount Hamilton, 10 teachers and 2 students; at San Francisco, 183 teachers and 731 students. During the year 1898, up to November 1, there were conferred: Bachelor degrees, 190; higher degrees, 21; professional degrees, 142. In 1898 there were about 76,000 volumes in the library; the productive funds amounted to \$2,818,748, and the income and benefactions to \$577,451; for 1897-98 the receipts and expenditures balanced at \$216,092. In 1898 an international competition of architects, presenting plans for new buildings to be erected through the generosity of Mrs. Phebe A. Hearst, was held at Antwerp, Belgium; Miss Cora Jane Flood gave the university a mansion and 540 acres of land; many gifts of money and books were received during the year, and the college of commerce was established. This has courses in history and political science, in commercial and international law, in modern languages, including Chinese, and in technical studies, including botany, forestry, agriculture, fisheries, mining, etc. In the latter part of 1897 an expedition, provided for by the late Col. C. F. Crocker, and under the direction of Prof. W. W. Campbell, of the Lick Observatory, went to India to observe the solar eclipse of January 22, 1898. President Martin Kellogg, LL. D., resigned in 1898. See UNIVERSITIES and COLLEGES.

CAMBODIA is a province of French Indo-China, with an area of 46,000 square miles and an estimated population of 1,500,000, composed of various native tribes, together with some 250,000 Chinese and Anamites and 40,000 Malays. The country has been a French protectorate since 1863. Its soil is fertile, producing rice, betel, tobacco, indigo, sugar cane, pepper, maize, cinnamon and coffee. In 1887 it was united with Anam and Tonquin into a customs union and at present it is, together with these two provinces and Cochin-China, subject to the direction of the Superior Council of Indo-China (q. v.), though really administered by its own ruler, King Nerodom.

CAMBON, JULES MARTIN, French diplomat, was born in Paris April 5, 1845; was educated at the Lycée Louis le Grand, completing his course with the lectures at the law university, at which he was graduated in 1866, and was admitted to practice. In the Franco-Prussian war he served with distinction in the division of Seine-et-Marne, and after peace was established he was attached as a chief of bureau to the Algerian Government Department. In 1879 he was made general secretary to the prefecture of police of the Seine, and three years later when his brother, Paul Cambon, left the prefecture of the Department of the Nord to become French Resident at Tunis, Jules Cambon was appointed his successor. In 1889 he was transferred to the prefecture of the Rhone; and in April 1891, was appointed to the responsible position of governor of Algeria. He was appointed in September 1889, to succeed M. Patenotre, transferred to Madrid, as ambassador at Washington, and entered upon his duties in January 1898. Upon the outbreak of the Spanish-American war he was designated by the Spanish government to protect its interests, and he was the Spanish representative in the framing of the protocol of August 12, 1898. His work in representing Spain was worthy of praise from each of the hostile nations. M. Cambon is said to be one of the ablest French diplomats.

CAMERON, MALCOLM COLIN, born in Perth, Ontario, April 12, 1832, died at London, Ontario, September 26, 1898. He practiced law and was a successful politician, being several times elected to the Canadian Federal Parliament from South Huron and West Huron. At the time of his death he was Lieutenant-Governor of the Canadian Northwest Territories.

CAMEROON, or the **CAMEROONS**, region is a German protectorate of West Africa with a coast line of about 200 miles on the Bight of Biafra between the Campo river and the Rio del Rey; bounded on the north by the Niger Territories

and on the south and east by French Congo, with an area estimated at 191,130 square miles and a population of 3,500,000, of whom in 1897, 253 were whites. Its northernmost point is on the southern shore of Lake Tchad. The inhabitants are Bantus and Soudan negroes. The soil in the coast region is fertile along the western slopes of the mountains. The rainfall is abundant and the conditions are good for the cultivation of cocoa and coffee. Among the other products are tobacco, cloves, caoutchouc, vanilla, ginger, pepper, ivory, and palm oil, and gold and iron are said to occur. Here as in the other German colonies, a duty is levied on imports and the revenue is mainly derived from this source. The chief town is Cameroon on the coast, and in the interior are Victoria, Bibundi, Campo and other important trading stations. It was organized as a protectorate in 1884 and is administered by a German imperial governor, assisted by a local council. Its boundary toward the Niger coast Protectorate and Niger Territories was settled by agreements in April 1893, and the respective limits of the French and German spheres were settled in the following year.

CAMPBELL-BANNERMAN, SIR HENRY, G. C. B., M. A., LL. D., Liberal Member of Parliament for Stirling District since 1868, was born September 7, 1836. He was educated at Glasgow University and Trinity College, Cambridge. He was Financial Secretary to the War Office in 1871-74 and 1880-82; Secretary to the Admiralty, 1882-84; Chief Secretary for Ireland, 1884-86; Secretary of State for War, 1886 and 1892-95. He has a reputation for considerable administrative ability.

CAMPBELLITES. See DISCIPLES OF CHRIST.

CANADA, DOMINION OF, occupies the northern part of North America, with the exception of the crown colony of Newfoundland, to which Labrador belongs, and of Alaska, which belongs to the United States. The area is 3,315,647 sq. m.; gross area, including lakes, rivers, etc., 3,456,383 sq. m.; and the population in 1891 was 4,833,239 and in 1898 was estimated at about 5,250,000. According to the census of 1891, 29.4 per cent. of the people were French-speaking and 86 per cent. were natives of British North America. The capital of the Dominion is Ottawa and the chief cities are Montreal, Toronto, Quebec, Hamilton, St. John and Halifax. The provinces are Quebec, Ontario, Nova Scotia, New Brunswick, Prince Edward Island and British Columbia. Besides these, there are the territories and Arctic islands, with an area in 1896 equal to two-thirds of the whole. Parts of the territories have been divided into districts. These districts are Assinaboia, Alberta, Athabasca, Saskatchewan, Keewatin, Ungava, Franklin, Mackenzie and Yukon.

In 1897 the boundaries of Ungava, Keewatin, Franklin, Mackenzie, and Yukon were changed, and in 1898 Yukon was organized as a separate district, with an estimated water surface of 2,000 sq. miles and land surface of 196,300 sq. miles.

Agriculture.—No general statistics of the agricultural and live-stock industries are gathered by the government, excepting in census years, and Manitoba and Ontario are the only provinces that supply anything like full returns. Some idea of the condition of these industries, however, may be derived from the official report on the exportation of their principal products. In 1897 the exports of domestic agricultural and live-stock products amounted in value to \$55,533,592. This included wheat, \$9,265,326; flour, \$1,720,361; other breadstuffs, \$8,813,191; and live stock (horses, cattle and sheep), \$9,872,321. The export of dressed meats aggregated \$6,627,624; cheese, \$14,676,239; butter, \$2,089,173; and eggs, \$978,479. Of the total exportation, an aggregate of \$45,825,601 went to Great Britain, and \$7,090,647 to the United States. See also MANITOBA and ONTARIO.

Mineral Products.—In the calendar year 1897 the mineral productions had an aggregate value of \$28,789,173. The most valuable ones were coal, \$7,286,257; gold, \$6,027,016; silver, \$3,322,905; copper, \$1,501,660; nickel, \$1,399,176; lead, \$1,396,853; petroleum, \$1,011,546; natural gas, \$325,873; asbestos, \$324,700; and cement, \$275,273. The total output of coal was 3,876,201 short tons, of which 2,465,387 were mined in Nova Scotia and 988,796 in British Columbia. In gold, British Columbia had an output of \$2,724,657; the Northwest Territories, including the Yukon district, \$2,550,000; Nova Scotia, \$562,165; Ontario, \$189,294; and Quebec, \$900. Exports of the various mineral productions amounted in value to \$11,906,918.

Fisheries.—The total value of the yield of the marine and fresh water fisheries in the calendar year 1896, was \$20,407,424, Nova Scotia contributing \$6,070,895; New Brunswick, \$4,799,433; British Columbia, \$4,183,999; Quebec, \$2,025,754, and Ontario, \$1,605,674. The most valuable catches were cod, \$3,610,935; salmon (canned), \$2,988,258; herring (pickled), \$2,183,559; lobsters (canned), \$1,526,928; salmon (fresh), \$965,029; whitefish, \$773,345; trout, \$690,699; and lobsters (alive), \$678,834. The industry employed 75,237 persons, and vessels and apparatus valued at \$9,826,251, and was variously promoted by the government to the extent of \$443,587.

Commerce.—The imports of merchandise in the fiscal year ending June 30, 1897, aggregated in value \$119,218,609; exports, \$137,950,253; and the movement in gold

and silver was, imports, \$4,676,194; exports, \$3,492,550; making the total foreign trade of the year, \$265,337,606. Of the total imports \$70,766,316 was from the United States and \$31,562,855 from the British empire; and of exports, \$82,238,023 went to the British empire and \$49,373,472 to the United States. The aggregate trade with the United States was \$120,139,788, and with Great Britain alone, \$106,639,690. Duties collected on imports amounted to \$19,891,997. The figures for the six months ending Dec. 31, 1898, showed an increase in the aggregate trade of over \$14,000,000. The total was \$177,864,318, as against \$163,361,937 for the six months in 1897, and the increase was wholly due to imports, as there was a decrease of \$1,700,000 in exports. Duties in the six months increased by \$2,300,000 over 1897.

Banks.—The official bank statement for June 30, 1897, showed aggregate capital, \$61,949,536; circulation, \$32,366,174; deposits of all kinds, \$214,804,501; liabilities, \$247,766,150; assets, \$335,203,890. Exchanges at the clearing houses at Montreal, Halifax, Toronto, Hamilton, Winnipeg, and St. John, N. B., aggregated \$1,173,448,000, an increase of \$144,450,758 in a year. The government savings banks numbered 2, which had a total of 48,367 depositors and \$16,554,147 deposits; and the post-office savings banks, 779, with 135,737 depositors and \$32,380,829 deposits. Loan companies and building societies reported for 1896, capital, \$42,038,794; reserve, \$11,242,178; deposits, \$19,404,879; liabilities, \$143,296,284; assets, \$143,887,377.

Canals, Railroads, Post-offices.—The amount expended on canal works and maintenance to June 30, 1897, chargeable to capital, was \$69,297,152, and, additionally, from income, \$14,500,344—in all, \$83,797,496. Local reports showed that during 1896 a total of 25,622 vessels, of 4,677,826 tonnage, passed through the canals, carrying 3,413,674 tons of freight, and paying \$326,766 in tolls. Of the total, 4,650, of 1,228,120 tons, belonged to the United States. During the calendar year 1897, the total vessels that passed through the St. Mary's Falls canal was 17,171; tonnage, 17,619,933; freight carried, 18,982,755 tons; value, \$218,235,927; principal kinds of freight, wheat, \$48,654,143; flour, \$40,145,144; iron ore, \$31,901,145; copper, \$24,464,800. The business of this one canal, between the United States and Canada, was far in excess of that of the famous Suez canal. On June 30, 1897, there were 16,550 miles of railway in operation, and 16,687 miles of track laid. The aggregate capital was \$921,858,232; earnings, \$52,353,277; operating expenses, \$35,168,666; passengers carried, 16,171,338; freight carried, 25,300,331 tons. The Dominion government had aided the railways by grants aggregating \$155,627,346; the provincial governments by \$33,474,806; and municipalities by \$18,031,113—in all, \$207,133,265. In addition to the grants, the Dominion governments had paid a total of \$41,890,887 in subsidies to the railways. Post-offices, June 30, 1897, numbered 9,191, and handled in the year 123,830,000 letters, 26,140,000 postal cards, and 101,319,946 packages of various kinds. The revenue of the department was \$4,311,243; expenditure, \$4,897,783; deficit, \$586,540. There were 1,349 money-order offices, which issued 1,162,209 orders, for \$10,683,174 payable in Canada and \$2,304,057 payable in other countries, and paid orders issued in other countries amounting to \$2,245,467.

Education.—For a review of the educational statistics, see the titles of the provinces respectively. Public libraries number 325, with 663,125 volumes, and in all libraries, 480, with 1,874,632 volumes. In Ontario the various mechanics' institutes have been designated public libraries. In 1898 the periodicals in Canada and Newfoundland numbered 907, of which 105 were dailies, 628 weeklies, and 117 monthlies.

Finances.—The revenue of the consolidated fund, in the year ending June 30, 1897, was \$37,829,778; expenditure, \$38,349,760; excess of expenditure, \$519,982; duties of all kinds collected, \$39,458,067; subsidies to provinces, \$4,238,059, and to railways, \$416,955; expended on militia, canals, railways, public buildings, public works, and provinces, \$3,523,160. Customs yielded \$19,478,247; excise, \$9,170,379; taxes, \$28,648,626; and investments, \$1,443,004. The gross debt of the Dominion was \$332,530,131; assets, \$70,991,535; net debt, \$261,538,596; of the gross funded debt, \$218,255,503 was payable in London and \$9,188,638 in Canada. The provincial revenues were \$11,934,061; expenditures, \$12,900,776; and net debts, \$30,963,256.

Militia.—The permanent and active militia, for the year ending June 30, 1899, comprised, permanent officers, 58; sergeants, 137; rank and file, 668—total, 863; active, officers, 3,053; sergeants, 2,989; rank and file, 29,300—total, 35,342.

Population.—As officially estimated the population in 1897 was about 5,185,990. The Indian population was reported at 99,364. There were 285 schools for Indian youth, which had an enrollment of 9,628, and an average daily attendance of 5,357.

Government.—The executive authority is vested in the sovereign of Great Britain, whose representative in the Dominion is the Governor-General and a Privy Council of 15 members who are responsible to the Parliament. The latter body consists of two houses, a Senate of 81 members nominated for life and a House of Commons of 213 members, elected for five years by the people of the provinces in proportion to their population at the last census, but Quebec is always entitled to 65 members. On the basis of the last census (1891), the ratio is one for every 22,688 inhabitants.

HISTORY.

Political Parties.—The two chief political parties are, as in Great Britain, known by the names of Conservatives and Liberals. The former controlled the government, with the exception of an interval of five years, from the time of the establishment of the Dominion in 1867 to 1896, when the Liberals gained a decisive victory. The most prominent Conservative statesman was Sir John Macdonald, who was in office from 1867 to 1891, with the exception of the five years' interval during which the Liberals were in power. In the general election of 1896 the Liberal programme comprised the gradual adoption of free trade, the extension of the suffrage, the promotion of foreign trade, and non-interference in provincial affairs. Their leader was Sir Wilfred Laurier. The Conservatives supported protection and a preferential tariff with a view to directing trade so far as possible to Great Britain and the colonies. They also emphasized the need of internal improvements and favored interference on behalf of the Roman Catholics in Manitoba. Other parties in the field were the McCarthyites, who had withdrawn from the Conservative party, and the Patrons of Industry, a Labor party. In spite of the Roman Catholic vote, which was given wholly to the Conservatives, the Liberals were successful and the House of Commons was made up of 118 Liberals, 86 Conservatives and 8 Independents.

Parliamentary Session.—The third session of the eighth Dominion Parliament opened on February 3, 1898. Among the important measures discussed were the Yukon railway bill, the investigation of the Drummond railway affair, the proposed railway commission, the change in the Federal franchise and the British preferential tariff. The Yukon railway bill had for its object the confirmation of a contract for the building of a railway line which should pass wholly through Canadian territory to the Klondike region. No aid was to be given by the government beyond the grant of 25,000 acres per mile. The route selected was along the Stikine river from Glenora to Teslin lake. The contract required the deposit of security for its fulfillment and an agreement that the road should be in working order by September 1, 1898. It gave the projectors the right to build wharves and docks and protected them for five years against any rival enterprise which should undertake to build along the route of the Lynn canal. After a long debate the measure passed the House, but in the Senate it was promptly defeated. There was some discussion over an alleged deal on the part of the government with the Drummond county railway and the Conservatives appointed committees from their own party to investigate the affair. The report of these committees wholly exonerated any member of the government from the charge of dishonesty. In March a proposal came up for consideration before the House for the establishment of a board of railway commissioners in control of the railway companies of Canada, to enforce the provisions of the railway act and see that the conduct of the companies should conform to the public interests. A franchise measure was introduced looking to the substitution for the existing franchise in Federal elections of a new system, in accordance with which the provincial franchises should prevail. The opposition objected on the ground that Parliament should control the Parliamentary franchise, but the measure passed before the close of the session. It was announced by the finance minister in April that from August 1 the reciprocity clause of the tariff would terminate and the minimum tariff would apply only to the United Kingdom and certain of her colonies. It was also stated that any other British colony might enjoy the benefit of the preferential tariff if it appeared that its own tariff was as favorable to Canada as the latter's was to it.

The School Question in Manitoba.—The Manitoba school difficulty began in 1890 when the provincial government passed a law abolishing sectarian schools. A number of judicial decisions were rendered on the question and the matter was appealed to the Imperial Privy Council. The grievances of the Catholics were not redressed and the Conservative party attempted to interfere on their behalf. This was one of the features of their political programme in the campaign of 1896. The Liberals, who triumphed at that election, opposed intervention in provincial affairs and in general refrained from interfering with the educational system of Manitoba. In 1897 the Pope addressed an encyclical to the prelates of Canada, reviewing the whole question and complaining of the act of the provincial Parliament in abolishing a right which was guaranteed by the act of confederation. He emphasized the necessity of an essentially Catholic education for Catholic children and he lamented the division among Catholics upon the question, saying that all should have united without distinction of party in protesting against the law of the provincial parliament. But in the existing circumstances he urged them not to reject partial satisfaction merely because they were unable to obtain their full rights and he declared his belief that justice would be done them in the long run. In 1898 there were signs that the Roman Catholics in the province were disposed to accept such a compromise as the legal situation admitted.

The third session of the Parliament closed on June 13, 1898. The Governor-General, the Earl of Aberdeen, who had resigned his office, took his official farewell. The new Governor-General, whose appointment was announced on July 25, was the Earl of Minto.

The Anglo-American Commission.—The increasing friendliness between the United States and Great Britain which manifested itself after the outbreak of the war between the United States and Spain, brought about, or at least hastened, the formation of a commission which should adjust the long list of irritating questions involving the relations of the United States with Canada. The principal subjects which the commission was to consider were: "The Behring sealing question; reciprocal mining regulations; the Alaskan boundary and restrictive regulations for the preservation of the fisheries of the great lakes; the North Atlantic fishery question; the boundary question; the alien labor laws and reciprocity of trade." On August 23 the Commission met in conference at the Parliament building in Quebec. Lord Herschell, the representative of Great Britain, was chosen chairman. Both he and all the other representatives were men of high standing and ability in their respective countries. The United States members were Senator Charles W. Fairbanks of Indiana, Senator George Gray of Delaware, Representative Nelson Dingley of Maine, John W. Foster of Indiana, John A. Kasson of Iowa, T. Jefferson Coolidge of Massachusetts. The Canadian representatives were Sir Wilfred Laurier, Premier of Canada, Sir Louis H. Davies, Minister of Marine and Fisheries, Sir Richard Cartwright, J. Charlton, M. P., and Sir James T. Winter, Premier of Newfoundland. A special motive on the part of Canada was the desire to retain her market for fish in Cuba and Porto Rico. Her annual sale to these islands has amounted to nearly \$1,000,000 worth of fish. It is natural that she should wish to keep this trade. Besides this she has been anxious for a long time to secure admission of fish free of duty to the United States market. In return for this she has offered such concessions as the admission of fishermen of the United States to the Canadian shore fisheries within the three-mile limit, and the doing away with other vexatious restrictions. This fishery question is one of the most important of all the subjects discussed at the conference. The objection to allowing the Canadian fish entrance free of duty to the United States was that it would ruin the interests of American fishermen. It was said that the New England fishermen who went every season to the Banks could not compete on equal terms with the Canadians in the American market. An injury to this class of men which would cripple and possibly destroy their trade was a thing very much to be deplored, for though not numerous these fishermen have supplied some of the best seamen in our navy. During the last war fully five hundred seamen of the first class had been engaged in the Gloucester fisheries.

In addition to the topics above mentioned, the commission discussed the transit of merchandise of either country across the intermediate territory of the other; and the facilitation of the conveyance of offenders in the custody of the law officers of one country through the territory of the other. The commissioners received a great deal of information and advice from interested persons in both countries. The most difficult question to settle appeared to be that of reciprocity. The session at Quebec lasted until October 10, with the exception of a recess from September 2 to September 20. Early in November the Commission resumed its work in Washington, D. C., and on December 19, adjourned to January 5th. During its session it seemed to have reached no solution of the fishery question but to have shown a disposition to refer it to arbitration, and in the meanwhile to allow the present status to continue, permitting the American fishermen to obtain privileges in Canadian waters upon payment of the tonnage tax. Reciprocity was the main point discussed during the last two weeks of its session in Washington. It was hoped that a compromise upon a less liberal reciprocity than that desired by the Canadian commissioners would be effected. In regard to the demand of the Canadian Commissioners for free lumber it was reported that the American Commissioners had agreed upon a compromise by which the existing duty would be reduced from \$2 a thousand feet to \$1. Another question under discussion was the framing of an international arrangement in regard to the use of canals, the Canadian Commissioners claiming that since Americans have the use of a Canadian Canal system, the Canadians should by way of compensation enjoy the freedom of the Hudson river to New York City. No definite results of its meetings had been made public by the close of the year.

The Canadian Prohibition Plebiscite.—On coming into power in 1896 the Liberal ministry in Canada promised to give the people an opportunity to express their sentiments regarding the vexed question of the prohibition of the liquor traffic. Provincial votes had been taken in previous years on the question, the results being in each case in favor of the Prohibitionists. In 1892 Manitoba voted 19,000 for and 7,000 against prohibition; in the following year Prince Edward Island voted 10,000 for and 3,000 against; Ontario in 1895 favored prohibition by a vote of 192,000 to

110,000, and Nova Scotia by a vote of 43,000 to 12,000. These votes of course were ineffective in securing prohibition, as the provinces do not possess constitutional authority to enact such measures. No vote had been taken in Quebec before 1898. In August 1898, the ministry appointed September 29 as the day on which a vote on the prohibition question should be taken throughout the Dominion, but this vote was to have no legislative force, although it was understood that the administration would be guided by the vote cast. The Prohibitionists immediately began a vigorous campaign, holding public meetings throughout the country and enlisting the services of almost all Protestant ministers except those of the Church of England; many of these, however, were strong Prohibitionists. The opposition did not resort so much to public meetings, but relied on the vast quantities of anti-prohibition literature, which they circulated in all of the provinces. Even before the election it was feared by many of the more conservative friends of prohibition that the very probable vote of Quebec against the measure might deter the government from enacting national prohibition laws, although the other provinces might strongly favor them.

The plebiscite occurred on September 29, but since there was no election of any candidates for office, and no other question besides that of prohibition under consideration, and since the vote had no legislative force, less than one-half of the qualified voters appeared at the polls. The question to be voted upon was worded as follows: "Are you in favor of the passing of an act prohibiting the importation, manufacture, or sale of spirits, wine, ale, beer, cider, and all other alcoholic liquors for use as beverages?" Aside from the province of Quebec, the aim of the Prohibitionists was not merely to win at the polls, but to secure immense majorities so that the ministry of Sir Wilfred Laurier, in bringing about prohibition legislation, might have the support of a very strong public sentiment. Accordingly the result of the plebiscite was disappointing to the Prohibitionists, for the entire Dominion gave a majority of only about 18,000 for prohibition, while Quebec, which is probably the richest and most influential province, with its French Roman Catholic population, gave a majority of 40,000 against the measure. About half of this majority was given by Montreal, Quebec City, and Hull. The other provinces gave the following majorities in favor of prohibition: Nova Scotia, 17,679; Ontario, about 15,000; New Brunswick, 12,540; Manitoba, about 8,000; Prince Edward Island, 6,160; British Columbia, about 500; Northwest Territories, 488. Almost startling is a comparison of the majority in Ontario in 1898 with that in the provincial plebiscite of 1895, when as is above pointed out, the majority for Prohibition was about 82,000. To a remarkable extent the rural districts were in favor of, and the cities opposed to, the measure. To the latter rule, however, Halifax, St. John, and Winnipeg, were exceptions. The plebiscite placed the ministry in a difficult position. With so strong a minority in six provinces and with an overwhelming majority against prohibition in Quebec, it was manifestly not only inexpedient but unjust to enact a law which so many persons consider incompatible with personal liberty. On the other hand the Prohibitionists had a majority sufficient to cause the downfall of the ministry. But little could have been gained by such a proceeding, for it is more than unlikely that a Conservative ministry would grant the Prohibitionists more than Sir Wilfred Laurier's Liberal one has done. But many of the leading temperance people took a fair-minded view of the situation, as may be seen from the following statement of Mr. J. S. Robertson, Secretary of the Canadian Temperance League: "I do not think, in view of the smallness of the majority, that the government would be justified in legislating on the lines of prohibition..... Much as I should like to see prohibition, the vote has shown that prohibition at the present time is impossible, especially with a large majority from one of the provinces against it. I doubt whether the government, even if it attempted to make a prohibitory law, could pass it."

CANALS. Canal construction in recent years has been confined to ship canals capable of passing ocean vessels and to the construction of canals for special purposes, such as water power, drainage, etc. About the only work done on boat canals has been in the nature of enlarging the prism in isolated instances and in improving existing structures and mechanical appliances. The following paragraphs cover the most notable recent work of these several kinds.

Aqueducts.—A recent development in aqueduct construction for carrying canals across waterways or depressions in the ground is the employment of steel, instead of masonry and wood in their construction. The older canal aqueducts were generally masonry arch structures, but occasionally they consisted of wooden troughs carried by masonry piers. This latter type of construction is still maintained, but troughs of steel are substituted for those of wood. A notable example of this latest type of canal aqueduct is that which carries the new level recently built to connect the Loire and the Briare canals across the River Loire in France. It is 2,173.6ft. long and 20½ft. in clear width with a depth of water of 7.216 ft., and consists of a continuous trough-shaped steel tank carried on masonry piers. Altogether there are 14

piers and three abutments carrying 15 spans of steel trunk each 131.2 ft. long and one span 39.85 ft. long. The main supporting members of the trunk are two parallel plate girders which form its sides. These girders are 11.15 ft. deep and are spaced 23.8 ft. apart. Riveted to the girders is a bottom framing of transverse and longitudinal girders carrying the steel plate flooring, or bottom, of the trough. Brackets attached to the outside of the main plate girders carry the tow paths, and similar brackets on the inside support the footpaths and fender timbers. The total cost of the steel trunk including the guard gates at each end and miscellaneous constructions was \$248,605 and the total cost of the entire structure was \$561,342.

The steel trunk aqueducts designed for the New York State canals improvements (see following paragraph on Boat Canals), but never built, consisted of an I-beam bottom and side framing, carrying a bottom and side plating of convex buckle plates of steel. The bottom buckle plates were filled with a binder of asphalt to protect them and to prevent leakage. The troughs had a clear width of 56 ft. 5½ ins. and a depth of 9 ft.

Boat Canals.—Since the great extension of railways the building of canals for transportation has been confined to ship canals capable of passing ocean vessels and to reconstructing existing boat canals. The most notable work of the last named character which has been undertaken recently is the deepening of the New York State Canals, comprising the Erie canal, 350.5 miles long, the Oswego Canal, 38 miles long, and the Champlain Canal, 65 miles long. This work was begun in 1896 and as planned consisted in deepening the prisms of these canals 2 ft., making the Erie 9 ft. deep, and the Oswego and Champlain each 7 ft. deep. In some respects the history of this improvement is one of the most important developments of recent years in American canal works.

By the New York State constitution all appropriations in excess of \$1,000,000 have to be approved by popular vote. Hence in 1895-6, after several years agitation to that end by the canal interests of the State, the State legislature passed a bill requiring the people to vote upon the granting of an appropriation of \$9,000,000 to be expended in canal improvements. This appropriation was voted upon on November 5, 1895, and the majority of votes in affirmative was very large. Surveys were begun on January 13, 1896. The letting of contracts followed the completion of the surveys and in the winter of 1896-7—the season of closed navigation—work was begun deepening the prism, and was continued until the opening of navigation again in May 1897. Work was resumed upon the closing of navigation in the following autumn and additional work was contracted for. In December 1897, the State engineer sent out the statement that the \$9,000,000 appropriation would fall some \$5,000,000 short of the sum necessary to complete the work as planned. Vigorous charges of extravagance and misappropriation of the canal funds were made by the daily papers against the canal officials and the conflict was carried into the State Legislature, which finally passed a resolution ordering the Governor to appoint a commission to investigate and report upon the work in the light of the charges which had been made. Meanwhile in April 1898, construction was discontinued, the \$9,000,000 having been expended.

The Governor's investigating commission submitted its report on July 30, 1898, which showed the condition of the improvement at the time work was discontinued to be as follows:

	Completed miles.	Incompleted miles.	Not contracted miles.
Erie canal.....	53.19	214.	83.497
Champlain canal.....	5.886	24.03	36.11
Oswego canal.....	6.63	6.73	24.11
Total.....	65.706	244.76	141.017

Of the total \$7,937,903 expended for work done on contracts, the commission reported that \$1,000,000 in round figures had been improperly expended. Numerous specific instances of this wastefulness were given. As a result of the report the Governor assigned Judge Edwin Countryman to make a special study of the testimony taken by the Commission and to report whether civil or criminal proceedings should be instituted against any person or public officers by reason of acts in connection with the canal work. Meanwhile on September 12, 1898, the State engineer and the Superintendent of Public Works of the State submitted an answer to the report of the investigating commission, which was substantially a denial, both general and specific, of the charges contained in the report. Judge Countryman submitted his report in December, 1898. This was very voluminous, but its general conclusion was that, while corrupt collusion with the contractors was not shown on their part, yet both the State Engineer and the Superintendent of Public Works

were guilty of various infractions of the law; and it advised that the evidence against both these officials be submitted to the grand jury. Immediately after the report was made public the Governor ordered the Attorney-General to institute criminal proceedings against the two officials.

Later a new set of State officials having meanwhile come into power as the result of the November elections, the State Senate called for estimates for completing the work contracted for and partly completed when construction was discontinued in April 1898. This estimate showed that in addition to the \$9,000,000 already spent the sum of \$3,780,816 would be required. Meanwhile numerous claims for damages had been filed with the court of claims on account of the canal contracts. As estimated by the investigating commission the total cost of completing the improvement as planned would aggregate over \$21,000,000. Continuation of the work requires a vote of further appropriations by the people, and this cannot be had before November 1900.

The physical problems connected with the New York State canals improvements were generally of no great difficulty. As already stated the work consisted in deepening the canal prisms 2 ft. This was done either by excavation or by raising the banks and sometimes by combining both methods. The methods of work in either case were simple, as was also the work of deepening the locks by raising the side walls. Lowering the lock floors, however, was more difficult as the old side walls had to be shored up and underpinned with new material. See paragraphs on Aqueducts and Lift Locks.

The only new boat canal actually being built in the United States is the Illinois and Mississippi canal designed as a short route from the upper Mississippi River to Lake Michigan in connection with the existing water routes of Illinois. It extends from Hennepin, Ill., to Rock Island, Ill., 77 miles, of which 50 miles are canal and 27 miles are slack water navigation down the Rock River. The canal proper and the summit level feeder will be 7 ft. deep and 80 ft. wide at water level. The feeder will be 34.75 miles long. There will be 37 concrete locks, 35x70 ft., with lifts of from 3 ft. to 10 ft. Construction was begun in July, 1892, and on January 1, 1899, about 18 miles of canal and 28 of the locks had been completed. The canal is being built by the United States government.

Drainage Canals.—The construction of large canals for sanitary and drainage purposes has called for some of the most important canal engineering of recent years. Prominent systems of this character have been put under way at New Orleans, La., Chicago, Ill., and at the City of Mexico, Mexico.

The City of New Orleans lies between the Mississippi river and Lake Pontchartrain and is highest along the river bank from which the land gradually slopes for about 9,000 ft., dropping in this distance some 13 ft., and then runs nearly level to the lake. The proposed drainage system applies principally to the removal of rain-water from the city area, which cannot drain into the river and which is very large in amount owing to the heavy precipitation here, and, secondarily, it applies to the removal of a portion of the groundwater, which at present saturates the soil and creates unsanitary conditions or makes property in certain sections useless. This total territory was divided into five drainage districts to each of which ran branch canals, with constantly decreasing capacity, separating into main drains, branch drains, and surface gutters extending to the limits of the district. These branch canals empty into a main canal seven miles long emptying into Lake Borgue. This canal is 70 ft. wide at the water-surface with a depth of 15 ft. and a capacity of 3,000 cu. ft. per second. The scheme includes besides the system of canals and drains, several pumping plants for raising the water from one level to a higher one at various points. The total estimated cost of the system is about \$8,000,000, and the work of construction is now in progress. It will be noticed that the dimensions of the main canal are greater than those of many boat canals.

The Chicago Main Drainage channel now approaching completion is, however, the largest canal ever constructed for sanitary purposes. It extends from the Chicago River in Chicago, Ill., to the Desplaines River at Lockport, Ill., 28 miles. Its section in rock is rectangular 160 ft. wide and 22 ft. deep; in earth trapezoidal 202 ft. wide on the bottom and 22 ft. deep, with side slopes of 1 on 2. These sections will pass 600,000 cu. ft. of water per minute, with a velocity of current of 1.26 miles per hour in earth and 1.92 miles per hour in rock. As only one-half this volume of flow is required at first the soft earth sections of the canal, which can be dredged larger after the water is turned in, have been made only 110 ft. wide on the bottom. The total amount of excavation is about 40,000,000 cu. yds., about 12,000,000 cu. yds. being solid rock. Total estimated cost \$28,411,000. This cost includes subsidiary works, comprising the diversion of the Desplaines River, which crossed the canal route several times, and its widening below Lockport to receive the canal waters; the enlarging of the Chicago River to admit 300,000 cu. ft. of water per minute to the canal; the construction of regulating works to control the outflow at Lockport;

and minor works of bridges for railway and highway crossings, etc. The regulating works comprise 15 vertical sliding sluice gates each 30 ft. wide and a bear trap dam 160 ft. long. The canal will take its water from Lake Michigan through the Chicago River, reversing the current of that stream into which the sewage of Chicago flows, and will discharge into the Desplaines River, whose waters empty into the Illinois River and thence into the Mississippi. This will keep all sewage out of Lake Michigan from which Chicago gets its water supply, which is the object of the canal.

Construction was begun in September 1892, and will be completed during 1899-1900. Wet excavation in earth, about 4,500,000 cu. yds., was done with dipper dredges in hard material and hydraulic suction dredges in soft material. For dry earth excavation steam shovels were used, loading into cars hauled to the spoil banks by locomotives, by teams and by stationary engines up cable inclines. Rock was broken by blasting and loaded by hand into buckets and cars, which were hauled to the spoil banks by cable inclines, teams, derricks, cranes, cableways, etc. The cost of earth excavation was 28.94 cts. per cu. yd. and of rock excavation 76.31 cts. per cu. yd. At the busiest times 8,000 men were employed on the work. The work was carried out by the sanitary district of Chicago through a board of trustees of nine members, who organized five executive departments, (1) department of construction; (2) department of law; (3) clerical department; (4) treasury department, and (5) police department, to execute their orders.

The City of Mexico drainage canal is one of the most notable examples of drainage engineering in the world. This city lies in an elliptical shaped valley 37 miles wide and 50 miles long enclosed by a wall of mountains. This valley has no natural outlet for its drainage, which however is collected by several lakes from 3 ft. to 15 ft. above the city level. The highest of these lakes, Zumpango, formerly emptied into Lake Texcoco, but an effort was made in 1607 to divert it into the Moctezuma River flowing into the Gulf of Mexico. For this purpose a great channel 21,650 ft. long, from 30 ft. to 150 ft. deep and in some places 300 ft. wide was begun in 1607 and completed in 1789, after nearly 200 years of intermittent work. This channel only partly served its purpose as it simply draws off the excess of Lake Zumpango and thus relieves the pressure on Lake Texcoco. The Mexican Central railway now enters the Valley of Mexico through this picturesque portal. Various later schemes for draining the valley were brought forward, but it was not until the partial inundation of the city in 1865 that the problem was actively undertaken. Mr. Francisco Garay, the well known civil engineer, then proposed an open channel from the city 165,243 ft. long to a tunnel through the mountains 29,421 ft. long. Work was begun several times, but was interrupted, and it was not until 1885 that President Diaz appointed a commission to carry it through. The present project consists of a canal from the gate of San Lorenzo, 29½ miles long, following the eastern side of the Guadalupe range between those hills and Lake Texcoco, changing its route before reaching mile 12 to a northeasterly direction so as to cross Lake San Cristobal diagonally, also a part of Lake Xaltocan and Lake Zumpango and then to the mouth of the tunnel near the town of Zumpango. The tunnel, a modification of the Garay project, has a length of about 32,870 ft. and was completed in December 1894. At its beginning the canal cut has a depth of 18.04 ft., which is increased in the last few miles to 82 ft. The side slopes are at an angle of 45 degrees. The bottom width is 18 ft. for the first 12½ miles and 21.3 ft. for the remainder of its length. The capacity of flow is 636 cu. ft. per second. The total amount of excavation was about 14,928,000 cu. yds. The rough excavation of the canal was completed in 1895 and the water was turned into it, but the work finishing the side sloping is yet in progress. The total cost of the canal was \$3,500,000. This drainage canal and tunnel take the sewage of the City of Mexico as well as the drainage of the valley.

Lift Locks.—Vertical lift locks for canals although employed long previously have come into recent prominence through the proposition to use at least one and perhaps two to overcome the two greatest lifts on the Erie canal at Lockport and Cohoes, N. Y. Simply described a lift lock is a trough or tank holding water into which vessels are floated and which is raised and lowered bodily between the two canal levels by means of hydraulic or other power aided sometimes by counterweights or flotation tanks. Such lift locks have been built at Anderton, England, in 1875; at Fontinettes, France, in 1885; at Louvière, Belgium, in 1888, and at Heinrichenberg, Germany, in 1895. This last lock had a tank 229.6 x 28.2 x 8.2 ft. with a lift of 62.48 ft. This tank is carried on six flotation cylinders working up and down in suitable circular wells, and is guided by four vertical framework guides placed at the corners. Vertical screws at these guides operated by electric motors supply the excess power over flotation to raise and lower the tank.

In the Erie canal work three comparative plans were completed for a lift lock at Lockport, with a trough approximately 225 x 191-6 x 9 ft. and a lift of 54.43 ft. Two of these plans provided for suspending the troughs by cables and operating them by

two distinct hydraulic methods. The other plan provided for the use of compressed air for operating the trough, and was the plan finally adopted. The work never advanced much beyond the completion of the plans owing to the lack of funds which finally stopped work on the canal improvements. See paragraph on Boat Canals.

Ship Canals.—The outlook for a ship canal joining the Atlantic and Pacific oceans across the American isthmus is more favorable than it has been for many years, and both the Nicaragua and Panama schemes have been prominently agitated during 1898. The Panama canal across the Isthmus of Panama, 46.2 miles long, was begun in 1881 and abandoned in 1889, after an expenditure of \$156,400,000 and the completion of about two-fifths of the work. It was begun as a sea level canal but was afterwards changed to have four locks. Great scandals involving the disgrace of many prominent men, including the engineer, Ferdinand de Lesseps, signaled the liquidation of the canal company's affairs. They were finally placed in the hands of a receiver, who maintained control until 1894, when the concession and assets were turned over to a new company which had been organized. This company began a thorough study of the engineering and financial problems through its own engineers and afterwards through an international commission of engineers numbering 14 members, of whom Brig.-Gen. Henry L. Abbott, U. S. Engineering corps, and Mr. A. Fteley, N. Am. Soc. C. E., were Members from the United States. This commission made its report in December 1898, and the following description is based upon this report.

The canal extends from Colon on the Atlantic to Panama on the Pacific coast, 46.2 miles including 3.35 miles dredged in the Pacific to deep water. The profile of the canal presents in the central part a high summit—the Cordilleras—from which the ground slopes gradually although irregularly towards the low grounds adjacent to the sea coasts. Starting from Colon the canal is now navigable for about 11.8 miles, the depth varying from 16.4 ft. to 29.5 ft. From mile 11.8 to mile 26.7 excavation is proceeding the entire distance with cuts at Bohio, 131.2 ft. deep and at San Pablo and Matachin, 82 ft. and 98.5 ft. deep respectively. From the 28th mile rises the central mass of the Cordillera making the great Culebra cut, which has already been excavated to a depth of 164 ft. The slope towards the Pacific is now reached, with a cut of from 49 ft. or 65 ft. to 196.5 ft. diminishing at the 40th mile to 6.5 ft. to 16.4 ft. From this point to the Pacific the canal has been excavated to the depth of from 6.5 to 26.2 ft. From mile 42.8 to the great depths at Naos at mile 49.5, the canal is completed so as to be navigable to a depth of from 16.5 ft. to 29.5 ft., which was recently excavated by the new company to an average depth of 27.8 ft. In brief the work already done constitutes fully two-fifths of the entire council work.

The commission established the summit level of the canal in the Culebra cut at 68.08 ft. above the sea and gave it a bottom width 118.11 ft. and a length of 318.35 ft. The next level east from Obispo to Bohio was given a bottom width of 164 ft. and a length of 13.37 miles. The final Atlantic level was given a bottom width of from 98.4 ft. to 111.5 ft. and a length of 14.84 miles. The first level west of the summit level was made 7.963 ft. and the two following were made 7.930 ft. and 4.69 miles long, respectively, not including the dredged channel 3.36 miles long. Between the different levels are double locks, the working length of both being 738.22 ft., and the width of one 82.02 ft. and of the other 59.05 ft., with an intermediate gate. The depth of water in the locks is to be generally 29.5 ft. and is not to exceed 32.8 ft. It is designed that the slopes of the canal especially in the deep central cut are to be protected by a stone rivetment. Of the 46 miles of the canal 26.75 are straight and 15 miles have radii equal to or not exceeding 9,850 ft., except in one case where the radius of curvature is 8,200 ft.

For a considerable part of its length the route of the canal is in the valley of the Chagres river, a torrential stream which although inconsiderable in dry times is subject to sudden and sometimes enormous freshets. It was necessary therefore to divert or regulate this stream in such a manner as to protect the canal from damage. The means adopted to regulate the flow is to erect two large dams. One of these dams will be located at Bohio and will be of earth with a depth of water against it of 65.62 ft., making a reservoir 21.5 square miles in area and of a capacity of between 196,200,000 and 261,600,000 cu. yds. of water. The other dam will be located on the Upper Chagres about $9\frac{1}{2}$ miles from the canal. This will be built of concrete masonry 134.5 ft. high and 936.75 ft. long on top and a height of 164 ft. above the canal. The reservoir formed will have a capacity of from 130,800,000 cu. yds. to 170,000,000 cu. yds., and one of its functions will be to supply the summit level with water through a feeder canal $9\frac{1}{2}$ miles long and 6,605 gallons per second capacity starting at an elevation of 190.25 ft. above sea level. The reservoir will also furnish hydraulic power for generating electricity, for operating the locks and lighting and power purposes generally. Both dams can consequently accumulate at least 60,000,000,000 gallons, which, with proper adjustable weirs are more than sufficient to control the largest freshet. See CENTRAL AMERICA (Map).

The estimated cost of completing the canal is given by the commission as \$102,400,000. The concession for the Panama canal was granted May 28, 1878, extended Dec. 26, 1890, and Aug. 4, 1893. The time for the completion of the canal is thereby fixed at October 1904, but in December 1898 the Columbian government granted an additional extension of six years subject to the formality of ratification of Congress when it reconvenes. This is an exclusive concession. The commission states that for four years there have been continuously employed from 3,000 to 4,000 workmen on the canal works besides a large force of engineers and at the end of 1898 that number was at work.

The Nicaragua Canal is in some respects the more notable of the two inter-oceanic canal schemes. This canal as projected extends from Greytown on the Atlantic to Brito on the Pacific coast, a distance of 170 miles of which 29 miles are canal proper and 141 miles are river and lake navigation. The first concession was granted in 1849, abrogated for non-fulfillment of conditions in 1856, and renewed in 1857. In 1889 the Maritime Canal Co., was incorporated by the Congress of the United States, and preliminary work on construction begun. By October 1890, about \$2,000,000 had been expended mostly in surveys and harbor and terminal work at Greytown. Work was, however, discontinued in 1893 as money to continue it could not be obtained from private investors. Since 1893 bills disposing of the concession to the United States have been introduced at nearly every session of Congress and have failed of passage. In 1895, however, Congress authorized a commission to investigate the canal company's plans and estimates which placed the cost of the canal at \$87,000,000. This commission made a preliminary estimate of \$133,472,000 as the cost of the canal and recommended that further surveys and studies be made to secure data for final estimates. In 1897 another commission was appointed to make the suggested further investigations and this commission has not yet presented its report. In the fall of 1898 the Nicaraguan government announced that the Maritime Canal Co.'s concession expired in October 1899, and about the same time it granted a concession to Mr. Edward Eyre and Mr. Edward F. Cragin of New York to take effect when the older concession expired. A syndicate headed by Mr. William R. Grace of New York has been organized to build the canal on the Eyre-Cragin concession employing private capital. See CENTRAL AMERICA (Map).

The general scheme of the various bills which have been introduced into Congress by the Maritime Canal Co. has been to have the U. S. government guarantee the bonds of the company to the amount of \$100,000,000—this amount has gradually become smaller as the years passed—and receive the company's stock in payment. In the Congress of 1897-8 the bill proposed to give the canal company's stock and bondholders and creditors \$4,500,000 in bonds and \$7,000,000 in stock in exchange for their holdings. The bill presented to the Congress of 1898-9 proposed to give the canal company \$5,000,000 in bonds and to pay its debts. The old company was in fact to disappear and the new company under the same name was to be practically a department of the United States government, all its directors being appointed by the President. The Senate passed this bill after making several radical amendments which provided, that: The payment made to the Maritime Canal Co. should be only such an amount as the "rights, privileges, franchises and property of the company are actually worth in cash," this amount to be determined by three commissioners to be appointed by the President; that no payment should be made unless the President "shall decide to construct a canal under the concessions granted to the canal company;" and, finally, that should the President fail to receive the necessary extensions of concessions he should take steps to negotiate for some other route for a maritime canal. The House of Representatives "amended" the Senate bill by striking out every thing but the first clause and substituting an entirely new bill, which provided that the President should purchase from the governments of Nicaragua and Costa Rica the necessary territory on which to construct a ship canal and appropriated \$115,000,000 for building the canal through this territory. This bill failed to pass the House. The House Bill was then attached as an amendment to the River and Harbor Bill in the Senate and to the Civil Service Bill in the House.

Water Power Canals.—Another class of canals which has recently assumed importance is that employed in developing water power. The two most important canals of this class are the Massina Canal in New York and the Sault Ste. Marie Canal in Michigan. The Massina Canal is designed to divert a portion of the waters of the St. Lawrence River and carry them 16,200 ft. over a comparatively level plateau to the gorge of the Grasse River where a fall of 42 ft. can be secured. The prism of this canal is 187.5 ft. wide on the bottom, with a depth of water of 25 ft. and side slopes of 1 on 1½, which made the width at water level 262½ ft., and is the largest canal prism ever excavated. Altogether the excavation will amount to about 8,000,000 cu. yds. The Sault Ste. Marie canal is designed to divert a portion of the water of the St. Marys river above the rapids which has a fall of some 19 ft. in 3,500 ft. and carry it to a power house in sufficient volume to develop 40,000 horse-

power. The canal in rock has a rectangular section of 200x22 ft., and in earth a trapezoidal section of 174 ft.x22 ft.x218 ft. In the earth section the bottom and sides of the prism are rivetted with timber to prevent scour by the current.

CANARIES, or **CANARY ISLANDS**, a group of islands in the Atlantic ocean belonging to Spain, and lying off the northwest coast of Africa. They cover an area of 2,808 square miles. The population (1887) was 291,625. For administrative purposes they are regarded as a part of Spain. The principal islands are Teneriffe, Grand Canary, Palma, Gomera, Lanzarote, Fuerteventura, and Hierro, or Ferro. The chief products are cereals, tomatoes, bananas, and potatoes.

CAPE COLONY proper is that district of southwestern Africa which is bounded on the north by the Orange river and the Kei, but in recent years the outlying districts to the north have been successively annexed. The following table taken from the *Statesman's Year-Book* of 1898 shows the area and population of the Colony and these annexed territories according to the census of 1891:

POPULATION IN 1891.

	Area. sq. m.	European or White.	Colored.	Total.	sq. m.
Cape Colony proper.....	191,416	336,938	619,547	956,485	5.00
Griqualand West.....	15,197	29,670	53,705	83,375	5.49
East Griqualand.....	7,594	4,150	148,468	152,618	20.10
Tembuland	4,122	5,179	175,236	180,415	43.77
Transkei	2,552	1,019	152,544	153,563	60.16
Walfisch Bay	430	31	737	768	1.79
Total.	221,311	376,987	1,150,237	1,527,224	6.90

Only about one-third of the population are whites and of these the Dutch are the more numerous. Besides those districts mentioned in the table Pondoland was annexed in 1894 having an estimated area of 4,040 and a population of 166,080, and British Bechuanaland, formerly a crown colony was annexed in 1895, having an area of 51,574 and a population of 72,736. The chief towns are Cape Town with a population of 83,718 (including its suburbs), Kimberley, Port Elizabeth, Graham's Town, and Beaconsfield.

Production and Commerce.—The mineral wealth of the colony is extensive. Gold and diamonds are the most important mineral products and they are exported in large quantities. Kimberley has for some years been the centre of diamond mining and owes to this a very rapid growth. Other minerals found are copper, coal, manganese, lead ore, iron ore and zinc blende. Manufactures have been developed in recent years. The leading exports are gold and diamonds which in 1897 amounted respectively to £11,991,926 and £4,450,376. Both in respect to exports and in respect to imports Great Britain and her colonies control by far the greatest portion of the trade. The coal which is found in the colony is wholly inadequate for the needs of the inhabitants and almost all of the coal used is brought from Cardiff, South Wales. American trade has not developed as rapidly in the Cape as that of some other countries, especially Germany. The American manufacturer is dependent upon competitors for the shipment of his goods and the collection of his drafts. The United States Consuls in South Africa suggest many ways in which the American merchant may extend his trade connections, and point to the example set by the German and English manufacturers in adapting themselves to the needs of their customers. Among other suggestions it has been proposed that the United States should open an exposition showing samples of American produce. The wages of labor are on the whole very high, but it must be remembered that the cost of living is higher than in the United States. Among the rates of wages quoted by the American Consul-General at Cape Town on April 1, 1898, are the following: brick layers \$19.50 per week, boiler makers \$16.50 per week, bakers \$16.50 per week, blacksmiths \$15.00, carpenters \$18.00, curriers \$20.00, cabinet makers \$20.00, engineers \$15.00, harness makers \$15.00, gas-fitters \$15.00, masons \$15.00, tailors \$20.00. Cape Colony produces large quantities of tobacco, wheat, oats, mealies, corn, rye and hay; besides pastoral products including wool, mohair, butter, ostrich feathers, etc. There are very extensive sheep farms and the number of sheep raised is large. Figures quoted by the United States Consul in 1898 show a steady increase of the square miles devoted to sheep farming since 1856. Between 1891 and 1895, however,

there was a falling off in the number of sheep and in the amount of wool obtained. As to the commerce in 1898, it appeared from the Consul-General's report that in the imports there was a considerable falling off during the first three months of 1898 as compared with the first three months of 1897, while the exports showed an increase during the same period. Important changes were proposed to Parliament in regard to the tariff in 1898, these changes showing on the whole a considerable increase over the existing rates.

Government.—The constitution in its present form dates from the year 1872. It provides for a responsible government the executive being vested in a governor with a ministry of five members, and the legislative authority in two elective chambers. The upper house or Legislative Council consists of 23 members chosen for 7 years and the lower house or House of Assembly of 25 members chosen for five years. The Governor in 1898 was Sir Alfred Milner K. C. B.

Political Situation.—In 1898 occurred the first of the elections for the Legislative Assembly since the Jameson Raid, and it is interesting to note the influence of the Raid on the present condition of the political parties. It must be remembered in studying Cape politics that the government is not a party government, and that it may continue in office when it has not a majority of adherents. No great principle divides the political parties, and the main motive which retains a government in power is the mere instinct of self-preservation. One of the chief political factors is the so-called *Africander Bond*, which has for its objects the promotion of the *Africander* interests, and the stimulation of national *Africander* feeling. It is strongest among the farmers and in the small rural towns. It cannot be called a political party, but is rather a nationalist organization, with a definite racial programme. The party groups down to the time of the Raid were thus divided: In the first place there was the Rhodes group, which was held in power by the *Africander Bond* until the time of the Raid and from motives of self-interest maintained friendly relations with that organization. Secondly, there was the *Africander Bond* itself, very conservative in tendency and with the race question always in mind. Thirdly, there was the Progressive group, which was the party of the opposition, disliking the conservative policy of the Bond, and opposing Rhodes on account of his friendliness toward the latter. The effect of the Jameson Raid was merely to divorce the Rhodes group and the *Africander Bond*. As a result of this, a good many of the Progressives were won over to the side of the Rhodes party, from which they had hitherto been kept on account of the alliance between it and the Bond. But the Bond group received recruits at the expense of the Progressives, for there were many of the latter who placed nationalist interests before a liberal internal policy.

The Rhodes group as is well known stood for the principle of imperialism or colonial expansion. Rhodes had shown himself something of an opportunist, ready to employ somewhat devious means in the attainment of his ends. Just as he allied himself to the Bond down to the time of the Raid, he now made overtures to the Progressive party to lift himself into power. Putting aside for the moment the nationalist and imperialist questions, it appeared that the respective party groups maintained the following attitudes toward matters of internal policy. In the first place as to the question of taxation: in Cape Colony taxes rest upon the necessities of life, such as bread-stuffs, meat, butter, cheese, etc., while luxuries including diamonds, native wines and spirits etc., are untaxed. Large incomes escape taxation, and one-fifth of the revenue raised by taxation is derived from taxes on necessities. The result is clearly to enhance the cost of living. Now the attitude of the Bond toward this question was controlled by the fact that its constituency was largely agricultural. It objected to the abolition of duties on food. The attitude of the Rhodes party was somewhat undecided. While desiring to protect the agriculturalists, Mr. Rhodes had expressed himself in favor of a compromise, seemingly admitting the iniquity of high taxes on necessities, and the exemption of luxuries. The Progressives, of course, favored thorough reform in this matter of tax policy. Many of them urged the taxation of those who were deriving wealth from the mineral resources of South Africa, instead of unjustly taxing the necessities of the poor. Some of the Progressives had tried to lay an increase of legacy and succession taxes. On the whole, however, none of the party groups had a definite programme in regard to taxation.

Another important question of domestic policy was the native question. The British treatment of the natives in the past had been on the whole fair. It will be remembered that abolition of slavery was one of the main causes which led to the exodus of the Boers, but of late years there has been a tendency to abuse the natives, or at least to regard them merely as a source of profit to the whites. A prominent Progressive of Cape Colony, writing in the *Westminster Review* of August 1898, pointed out the injustice of the government's treatment of the Langberg rebels. A revolt having broken out in a part of Bechuanaland, Cape Colony sent a force there to suppress it, and punish the insurgents. The campaign was successful, and the

punishment of the natives consisted in the wholesale deportation of the population to Cape Town, where they were bound out as apprentices to farmers, for a period of five years. It thus seemed, as this writer urges, that the government adopted a wholly different policy in dealing with the natives from that which it followed in dealing with the whites. The Progressives condemned this, and cited it as an instance of moral deterioration in the treatment of the natives. The other parties either upheld this policy or were divided on the subject. The Bond was not in favor of reform, for cheap labor was naturally to the interest of the farmers. The Rhodes party apparently had no definite views on the subject. The Progressives favored a more humane policy toward the natives, and obliteration, as far as possible of the foolish color prejudice, which is carried so far at the Cape, that, as the writer above quoted puts it, "If Prince Ranjitsinhji came to South Africa, he would not be allowed, according to the rules of the Cape Cricket Club to play in a first class match."

The third question of importance is the educational policy of the government. The attendance at schools is low. The payment of teachers is insufficient, and the instruction is poor. The Progressive party were united in favor of compulsory education, and condemned the apathy of the government in the past, although they admitted that considerable progress had been made during the last five years. Many in the other party groups were in favor of educational reform. Mr. Rhodes subscribed to what is known as permissive compulsion, that is to say, each district to decide whether it was willing to have compulsory education, but even if it rejected the measure it was to be called upon to contribute its share to the expenses of education throughout the country.

The fourth question concerned the sale of intoxicating liquors to the natives. For a long time the Progressives had labored to secure this reform, as well as to introduce an excise. As to the prohibition of the sale of liquor to the natives a bill had been brought in by the Hon. Rose Innes, the head of the Progressive party, which received support from many in the other party groups. The Bond generally had been opposed to an excise. Mr. Rhodes had declared in favor of the prohibition of the sale of liquor to the natives.

Such were the main party issues, during the first half of the year 1898. The most interesting feature of Cape politics was the programme of the Rhodes group. Mr. Rhodes had previously appeared to the Progressives as a champion of retrogressive measures. He was opposed to an excise, frequently declared himself in favor of duties on the necessities of life, and at one time advocated the increase of duties on breadstuffs. As a matter of fact his aims and ambitions had had little to do with matters of internal policy. He had treated these matters apparently from a merely opportunist point of view, trying to gain a sufficient following by party alliances, to realize his schemes of colonial expansion. After the rupture of his party with the Bond, he gradually veered toward the Progressive ideas, and in 1898 put forward a platform comprising the abolition of duties on meat, compulsory education permissive by districts, restriction of the sale of liquors to natives and other measures of a more or less liberal and progressive nature. His opponents did not neglect this chance to ridicule him for these changes of purpose. He himself, perhaps, furnished an explanation of this change of attitude by his contemptuous use of the phrase "parish-pump politics."

It was the object of the Progressives to turn public attention toward the matter of domestic reform, and away from the racial question, which had been the most disturbing factor in political life. The feeling of race antagonism between the Boers and the English had always been bitter, and hostilities frequently threatened to break out between the Transvaal and Cape Colony. To an outsider it would seem that this question would settle itself in the natural course of events, for sooner or later immigration must give so decided an advantage to the English element that the state will be constructed according to their own wishes. This, for instance is the view of Mr. Bryce who recommends to the English of South Africa, and to the British government "an attitude of patience and strict adherence to legal rights." The Boers are not prolific and their numbers are not being augmented from without. It is therefore inevitable that they will be swamped by their more numerous and enterprising fellow inhabitants.

The Elections.—The September elections in Cape Colony were disappointing to the sanguine hopes of Mr. Cecil Rhodes and the Progressive party. The vote resulted in the election to the lower house of forty members representing the Africander Bond and thirty-seven Progressives; Mr. Rhodes himself, however, was elected for two districts, Namaqua and Barkly West, of which he chose to represent the latter. He was bitter in his accusations that, in order to win the election, the Bond used money from the Transvaal; and he said that Africander victory would only afford President Kruger better opportunity of gaining control over South Africa. Mr. Rhodes had hoped not only that he would receive an election,

but that the Progressive party would attain a majority in the legislature, by the aid of which he expected greatly to advance his schemes of colonial expansion. The victory of the Bond carried with it no threat or new and definitely outlined policy. Many of the Dutch, though of course a minority, did not vote with it. The result of the election may be regarded as a rebuke to Mr. Rhodes himself. In England while popular sentiment was with the Progressives, the victory of the Bond was looked upon by many as a blessing in disguise, for though it was quite certain that the Africanders would maintain the onerous duties on food stuffs, it was thought that this evil would be counterbalanced by the closer and more friendly relations which would arise between the Cape and the Transvaal. The influence and power of Mr. Schreiner and Mr. Hofmeyr at Cape Town, together with their close and friendly relations with Mr. Reitz, the Secretary of State at Pretoria, would be sufficient, it was thought, to keep the two states at peace. The result of the election, moreover, was not so disastrous to Mr. Rhodes, as it first seemed. For he could now give more time to the development of Rhodesia and even to the extension of British authority far to the northward; for it is clearly his design that British authority extend straight through the continent of Africa from Cape Colony to Egypt. (See "CAPE TO CAIRO" RAILWAY SCHEME and AFRICA.) It is believed that he has long been in coöperation with the British Foreign Office and with British officials in Egypt. In September, shortly after Sir Herbert Kitchener's victory at Omdurman, gunboats sailed up the White Nile to meet Major MacDonald coming northward with a force from Uganda. It was said at the time that there "is little doubt that Mr. Rhodes is behind this movement, and that his schemes for British control in Africa will not be materially affected by the result in Cape Colony."

"CAPE TO CAIRO" RAILWAY SCHEME, a project for opening a line of communication under British control from one end of the African continent to the other. As set forth by Mr. Rhodes the plan seemed feasible. At the close of the year 1898 about 600 miles of railway had already been constructed extending from Vryburg in Bechuanaland to Buluwayo. The new line would begin at that point and extend northeast for about 100 miles and then due north following for the most part the 31st degree of longitude and crossing the Zambesi river at a distance of about 500 miles from its mouth. In general the course would lie between 500 and 800 miles from the coast. The total length of line when completed was estimated at about 1,750 miles. Among the great advantages which would result from it the following are mentioned: In passing from Buluwayo to the Zambesi it would traverse the gold country and open communication with the mines, tap a valuable coal district and open up a very fertile and thickly populated region to trade. On the northern side of the Zambesi river it was estimated that the railway would rise gradually to a height of about 6,000 feet but the grading would not be difficult. Here too productive and populous regions would be opened up to trade. It was also urged that the railway would equalize the rates of labor, which vary greatly at the different mining centres. Steamship service would afford communication between the southern and northern ends of Lake Tanganyika and from the northern end of that lake the project contemplates the continuance of the railway to a point in Uganda (q.v.), probably connecting there with the Uganda railway. As to the cost, it was estimated that to carry the line as far as the southern end of Lake Tanganyika would cost about £5,000,000.

CAPE VERDE ISLANDS are a group containing fourteen islands belonging to Portugal, and lying about 320 miles west of the cape from which they take their name. They have an area of from 1,480 to 1,650 square miles with a population estimated at 114,130, although some estimates place it as high as 120,000. The inhabitants are a mixed race who have descended from the Portuguese settlers and the negroes brought in from Africa. The negro element predominates, but the language spoken is a corrupted form of Portuguese. The chief products are sugar, cotton, coffee, tobacco, indigo, millet and medicinal products. The revenue for 1896-97 was estimated at 267,500 milreis and the expenditure at 277,080 milreis, the milreis being valued in United States gold at \$1.08. The islands are under a governor whose residence is at Praia, the capital.

CAPRON, ALLYN, captain of "Capron's battery," First United States Artillery, which took part in the battle of El Caney before Santiago, July 1, 1898, died near Fort Myer, Virginia, September 18, 1898, of typhoid fever contracted in Cuba. He was born in Florida. Captain Capron's father was killed at Churubusco, and his son, Captain Allyn K., in the fight at Las Guasimas, June 24, 1898.

CARBON DI-OXIDE. Dr. A. Fisher has described the methods by which carbon di-oxide can be collected from air and can be liquefied and put on the market in a practical manner. He computes that as many as 100,000,000 pounds of liquid carbon di-oxide, produced in the manufacture of beer, is going to waste each year.

The gas obtained from this source has the agreeable ethereal odors of the various fruit ethers which can be removed by washing.

CARBORUNDUM. During the past year the output of carborundum has increased markedly, and the compound is rapidly displacing all other abrasives in this country and in Europe. Carborundum is manufactured out of a compound of coke, white sand, salt and sawdust, measured and mixed in proper proportions. This material is subjected to an enormous voltage of electricity after being packed in furnaces. Rough, oblong boxes of brick, constructed without any mortar or cement, constitute the furnaces, each one measuring about fifteen feet in length by seven feet in width and seven feet in height. In the centre of each furnace is a large bronze plate which is connected by means of four large copper cables to massive copper bars extending under the floor at either end of the furnace. Connecting with the inner surface of the bronze plates are 120 carbon rods, 60 to each plate. These rods are 3 inches in diameter and a little over two feet in length, and are so placed as to pass through the end walls of the brick furnace, projecting into the interior and toward each other, constituting the terminals. About ten tons of the mixture described constitute a charge for each furnace, and is heaped smoothly about a core of granules of crushed coke about 21 inches in diameter and 9 feet long, extending through the mass so as to connect the ends of the carbon rods, thus completing an electrical connection through the furnace from bronze plate to bronze plate. Into this granular core or cylinder 1,000 horse power of electric current is turned, and kept flowing for twenty-four hours consecutively. About two hours after turning on the current, gases begin to escape through the crevices of the walls of the furnace, which ignite and burn with a blue flame. In twelve hours the entire mass of the compound becomes red hot. At the end of twenty-four hours the current is stopped. Upon removal of an end wall of the furnace the granular core is found to consist of pure carbon, all its impurities having been volatilized at an expense of one-quarter of its weight. Grains of graphite are found disseminated through its mass, from which it is inferred that its temperature has reached 7,000° during the passage of the current, the point of graphite formation. Surrounding the core is found a purplish crystalline formation, the crystals being constructed on lines radiating from its centre. As the distance from the core increases, the crystals decrease in size, until, at about fifteen inches from the core all crystallization ceases, and the material appears amorphous. This amorphous material is of a pale gray color for about two inches, then suddenly the color changes to black, this being the mass of the original mixture, cemented together by fusion of the salt. The crystalline and amorphous material is carbide of silicon, or carborundum, as it was named by its inventor, E. G. Acheson. About two tons of carborundum are produced in each furnace run, from ten tons of the mixture. After being taken out of the furnace it is crushed between iron rollers, to separate the crystals, and then freed of all solubles by being treated with an acid and water bath. It is then dried and sifted, to separate the various sized grains. The only factory for the production of carborundum is at Niagara Falls, N. Y., whither the industry was removed from Monongahela, Pa., in 1895. The electric current is supplied to the carborundum company by the Niagara Falls Power Company. Carborundum is used for dental and manufacturing jewelers' fine tool grinding, pearl grinding, polishing wheels, springs and other parts of watches, glass grinding and finishing, car-wheel grinding and general machine shop finishing. In the form of discs, hones, lathe wheels, engine wheels and cloth finishing it competes easily with emery, garnet and flint cloth. Its inventor, Mr. Acheson, has perfected a process for making electric light carbons out of 1 part of carborundum and 9 parts of pure carbon, reduced to a powder and combined with tar, moulded and baked. An ordinary cored carbon point may be used, and the core filled with carborundum either alone or mixed with a binding agent. For the filaments of incandescent lamps the carborundum in a very fine powder is mixed with and suspended in the oil used in the oil bath for the treatment of the building of the carbons. In the process of deposition, fine particles of carborundum become fixed to the filament simultaneously with the deposit of carbon. As carborundum is formed at a temperature approximately that of the electric arc, it is free from all volatile matters and acts unchanged as the light-giving body. It resists oxidation to a greater extent than any other known material even when heated highly and exposed to a stream of oxygen. It produces a greater quantity of light for the electrical energy consumed than any illuminating body heretofore used.

CARDINAL, the dignitary of the Roman Catholic Church ranking next to the Pope. The body of Cardinals constitute the sacred college and are the Pope's council and electors. There are three orders: Cardinal Bishops; Cardinal Priests; and Cardinal Deacons. From their list the new Pope is always chosen. The Cardinals at the end of 1898 were with their dates of creation:

Cardinal Bishops: C. Mazzella (1886); Mario Mocenni (1893); L. M. Parocchi

(1882); L. O. S. Stefano (1873); S. Vannutelli (1887); and Isidore Yerg (1884). Cardinal Priests: A. Agliardi (1896); A. Bausa (1887); A. Capecelatro (1885); A. M. Casajares (1895); S. Cassanas (1895); P. G. M. Celesia (1884); L. Conille (1897); S. Cretoni (1896); L. Di Canossa (1877); Angelo Di Pietro (1893); A. A. Ferrari (1894); D. Firrata (1896); A. Ferreira (1879); S. Galeati (1890); James Gibbons (1886); P. L. Goosens (1889); G. M. Gotti (1895); J. Haller (1895); I. Herrera (1897); D. M. Jacobini (1896); Philip Krementz (1893); George Kopp (1893); E. Laboure (1897); B. M. Langenieux (1886); V. Lecot (1893); M. Ledochowski (1872); Michael Logue (1893); A. Manara (1895); P. F. Moran (1885); J. S. Neto (1884); M. Rampolla (1887); F. M. Richard (1889); C. M. Sancha (1894); Joseph Sarto (1893); Francis Satolli (1895); L. Schlauch (1893); F. de Paul Schonborn (1889); P. Sourrieu (1897); D. Svampa (1894); V. Vannutelli (1890); Herbert Vaughan (1893); and Claudius Vaszary (1893). Cardinal Deacons: L. Macchi (1889); T. Mertel (1858); R. Pierotti (1896); G. Prisco (1896); F. Segna (1894); and A. Steinhuber (1895).

CABEY ACT. See IRRIGATION.

CARLINGFORD, First Baron (1874), **CHICHESTER SAMUEL PARKINSON FORESCUE**, P. C., K. P., was born at Glyde Farm, County Louth, Ireland, January 18, 1823, and died January 30, 1898. He was educated under private tutors and at Christ Church, Oxford. From 1847 to 1874 he was Member of Parliament for County Louth. He was Lord of the Treasury (1854-55); Under Secretary of State for the Colonies (1857-58 and 1859-65); Chief Secretary for Ireland (1865-66 and 1868-71), having a seat in the cabinet; President of the Board of Trade (1871-74); Lord Privy Seal (1881-85); Lord President of Council (1883-85); Lord Lieutenant Essex (1873-92). Up to 1886 Lord Carlingford was a Liberal, but after that date a Liberal Unionist.

CARNEGIE MUSEUM. See ANTHROPOLOGY.

CAROLINE ISLANDS, are a widely scattered archipelago in the Pacific Ocean north of New Guinea and east of the Philippines. They have an area of about 500 square miles with a population estimated at 36,000 and consist of 36 minor groups of islands, the principal ones being the Pelews or Palaos, Yap, Uluthi, Uleai, Namonuito, Ruk or Hugoleu, the Mortlocks, Ponapé or Bonabe, and Kusaie, sometimes known as Ulan or Strong's Island. They belong to Spain, being in that general island system which is called Spanish Micronesia. The war between United States and Spain in 1898 drew public attention to these islands along with the other colonial possessions of Spain and the United States Consular Report for September 1898 publishes an interesting account of the various groups by Mr. F. W. Christian, a well-known explorer in the Central Pacific.

In the Pelew group there are some 200 islands of which the chief one is Bab-el-Thaob, whose area is equal to that of all the others put together. The population of this group, estimated at some 3,000, speaks a Malayan dialect. The chief products are turtle shell, copra and *bêche de mer*. Fruits, especially yams, bread fruit, and cocoanuts, are grown in large quantities and there is excellent pasturage for horses and cattle. A curious form of money has existed in the islands, consisting of enormous discs of quartz which was quarried in one of the smaller islands. Yap, which gives its name to another group of islands, lies about 300 miles to the northeast of the Pelew group. It is surrounded by a coral reef. Inland there are wide stretches of swamp land, but few streams. Signs of an ancient civilization are present here, including terraces, stone-paved roads, and the walls of fish ponds in the lagoons. The natives who number some 8,000 are generally regarded as a peaceable and industrious folk. They speak a language similar to that spoken in the Pelews. The soil produces sweet potatoes, yams, pawpaws, taro, pineapples, sugar cane, bananas, and other fruits. Copra is an important article of export, the trade being chiefly in the hands of the Germans. There is a European settlement at Tomil Harbor which is the seat of the Spanish Governor for the Western Carolines. A small Spanish garrison is maintained on the islands and political prisoners taken in the course of the war in the Philippines were there held in custody.

The Uluthi or Mackenzie group, lies a short distance to the north of Yap. Its chief port and trading place is Arrowroot or Mokomok. The natives pay tribute to Yap and are in general of an industrious and law-abiding character. The Uleai group is not extensive, having a population of about 800. Its trading depot is Raur. The language is Malayan and the people are in part descendants from the ancient inhabitants of the Mariannes who fled from their homes when those islands were taken by Spain in the sixteenth century. The Hall group or Namonuito and the group of small islands to the south have a bad name on account of the acts of violence committed by the natives. Piracy has been practiced and has for the most part gone unpunished. Ruk or T'Ruk, so called from the name of the highest island in the group, lies to the eastward and consists of about seventy islands. Here,

too, copra is one of the chief products and turtle shell, *bêche de mer* and pearl shell are obtained in large quantities. An extensive trade is carried on with the Japanese and the Germans. Of late the natives have shown a turbulent temper and civil war has raged. The local government of the islands is in the hands of small chieftains or rajahs. The Mortlocks are inhabited by a race which shows a larger Polynesian admixture than in most of the islands. The inhabitants, like those of Ruk have the custom of cutting the lobe of the ear and forcing it to grow downward until it forms a long flap, giving them an extraordinary appearance. In some parts of this group piracy and acts of violence have been frequent of late. The products are for the most part the same as in the other islands and the trade is largely in the hands of the Germans.

One of the most important islands of the eastern groups is Ponapé with an area of 170,324 square miles. The natives are ruled by petty chieftains under the general direction of the Spanish governor. They are divided into several tribes. There is a small Spanish colony at Santiago on Asuncion bay. Near the island of Tomun there is a long artificial breakwater enclosing about fifty walled islands separated from each other by narrow canals. Interesting relics have been found on some of these islands showing the condition of civilization in the past particularly on the walled island of Nan-Tauch, which is regarded by the natives with superstitious reverence. The chief products of Ponapé are copra, turtle shell and ivory nuts. Of the trees found on the island may be mentioned the och, a variety of palm, the ais whose fruit is used in the making of varnish, and besides these there are in the interior forests fairly rich in timber and in wood for cabinet work. Pigs and a tailless variety of dog much esteemed by the natives as food, are found on the islands. A great variety of fruits are grown, the bread fruit being especially abundant. Mokil contains three low islands and a population of about 200. They speak the Ponapéan dialect. The Christian religion has been introduced and there is a strict prohibition of the use of intoxicating liquors and tobacco. Pingelap, lying some sixty miles to the south of the Mokil group consists also of three low coral islands lying close together, and has a population of about 1,000.

When the members of the Paris Commission had agreed upon the terms of peace between the United States and Spain, the representatives of the former power tried to induce Spain to cede one of the islands to the United States and to grant religious freedom to the entire group. These requests were refused.

CARTHAGE. See ARCHÆOLOGY (paragraph France).

CARTWRIGHT, Sir RICHARD, G. C. M. G., Canadian minister of trade and commerce, and member of the Anglo-American Joint High Commission, created in May 1898, by the British and American governments, was born at Kingston, Ontario, December 4, 1835. He was educated at Trinity College, Dublin, entered the banking business and became president of the Commercial Bank of Canada. In 1863-67 he was member of the Canadian Parliament for Lennox and Addington and, in 1867-68, after the confederation of the provinces, was member for Lennox. He then represented Centre Huron and subsequently South Huron, and since 1887 has been returned for South Oxford. At one time he was an independent supporter of Sir John A. MacDonald; but, after the "Pacific scandal," he came over to the Reform party. From 1873 to 1878 he was Minister of Finance in the Mackenzie cabinet; after the Conservatives came again into power, he was recognized as leader of his party in questions of finance. In 1897 he became a K. C. M. G., and in 1897, at the time of the Queen's Jubilee, was advanced to G. C. M. G. In 1896 he became Minister of Trade and Commerce in the Laurier cabinet.

CASIMIR-PERIER, JEAN PAUL PIERRE, former President of the French Republic (1894-5), born in Paris in 1847. He was a witness in the Zola case. (See FRANCE, paragraphs on History.) Many stories were told in regard to his sudden resignation of the presidency in 1895, connecting that resignation with the Dreyfus affair. According to one of these stories, he resigned on receiving a letter from Emperor William, of Germany, declaring the writer's belief in the innocence of Dreyfus, and naming the real culprit. According to another, the German ambassador, Count von Munster, sent a detailed report of the Dreyfus case to the German count in December, 1894, and that report was intercepted and photographed by the French authorities before it reached its destination. Count von Munster complained of this indignity, and demanded his passports. The President, in great distress, smoothed the matter over, but the same thing happened a second time. On this occasion the danger to the friendship of the two countries seemed so serious that the President found the only way of preventing disaster was his resignation. What basis these stories may have cannot be ascertained, but they are significant as showing the excited state of public opinion, and the sensational rumors that were set afloat. Casimir-Perier's appearance in the Zola trial was encouraging to the defence, for he seemed willing to offer his testimony, but the court ruled out most of the questions asked by the defence.

CATHODE RAYS. See BOTANY (paragraph Plant Physiology); and PHYSICS (paragraph Roentgen Rays).

CATHOLIC BENEVOLENT LEAGUE, a denominational fraternal insurance order, religious, social, and benevolent, founded in 1881. It consists of seven State councils; 667 subordinate councils; and 48,000 members. Since its organization \$9,045,542 benefits have been distributed, and during the last fiscal year \$1,081,407 was disbursed. Total membership 48,000. Officers, Rt. Rev. Charles E. McDonnell, Spiritual Advisor; John C. McGuire, Brooklyn, President; Alfred V. Harding, New Brunswick, N. J., Vice-President; John D. Carroll, Brooklyn, Secretary; and John D. Kieley, New York, Treasurer.

CATHOLIC KNIGHTS OF AMERICA, founded in 1877. It has one supreme council, 581 subordinate councils, 24,000 members. Rt. Rev. John M. Farley, New York, Spiritual Director; Edward Feeney, Brooklyn, Supreme President; C. S. Ott, Galveston, Texas, Supreme Vice-President; Joseph C. Carroll, Norfolk, Va., Supreme Secretary; and Gerard Rieter, Vincennes, Ind., Supreme Treasurer. Since its organization \$8,329,383 benefits have been disbursed and, \$710,208 in the last fiscal year.

CATHOLIC MUTUAL BENEFIT ASSOCIATION, founded in 1876, has a supreme council, six grand councils, 600 branches, and 43,000 members. Benefits disbursed since its organization amounted to \$7,000,000, during the last fiscal year, \$750,000. President, Michael Brennan, Detroit, Mich.; Vice-President, John M. Molamphy, Pittsburgh, Pa.; Recorder, C. J. Hickey, Brooklyn; and Treasurer, James M. Welsh, Hornellsville, N. Y.

CATTELL, REV. WILLIAM C., D. D., ex-president of Lafayette College, Easton, Pennsylvania, died in Philadelphia, February 11, 1898. He was born at Salem, New Jersey, 1827; graduated at Princeton, for five years was professor of Latin and Greek at Lafayette, and for three years was pastor of the Pine Street Presbyterian church in Harrisburg, Pennsylvania. He was President of Lafayette from 1863 to 1883; and it is said that through his exertions more than a million dollars was obtained for this college. After his retirement from the presidency he was chiefly engaged in work for the societies of the Presbyterian church, especially for the Board of Relief for disabled ministers, of which he was corresponding secretary.

CAUCASUS is the name of the mountain range between the Black Sea and the Caspian which now forms the boundary line between Europe and Asia. It is also the name of a Russian lieutenancy, lying on both sides of the mountain range, and having an area of 180,843 and a population in 1893 of 9,723,953. The census of 1897 showed that in Caucasus, as in most frontier communities, there was a larger proportion of males than of females, the ratio being 89.5 women for every 100 men. As to the ethnic composition of the population, it exhibits a very remarkable variety, including as the largest elements numerically the Russians (1,915,614), the Tartars (1,027,828) and the Armenians (803,696). But besides these there are Turks, Northern Tartars, Turcomans, Ossets, Persians, Georgians, Imeretes and a variety of other tribes. A large part of the mountain population lead a half savage life subsisting mainly by the chase. Education has made some progress among them in recent years, but according to the figures for the years 1891-94 a small number of children were in the schools in proportion to the total population, although the primary schools numbered 4,236 with an attendance of 143,786.

CAVAIGNAC, JACQUES MARIE EUGENE GODEFROY, former Minister of War in the Brisson cabinet, and prominent in 1898 in connection with the Dreyfus case (see FRANCE, paragraphs on History), was born in Paris May 21, 1853; served as a volunteer in the Franco-German War; was Minister of Marine in the Loubet cabinet in 1892, Minister of War in the Bourgeois cabinet in 1895-6; and Minister of War in the Brisson cabinet in 1898. He was a strong advocate of revision under the Méline ministry, but after a continued study of the case came to the conclusion that Dreyfus was guilty. It was his speech in the Chamber of Deputies in regard to the three documents which he considered conclusive proof of the guilt of Dreyfus, that created such a sensation, and by the government's order was placarded in all the communes of France. When he found that the main ground of his belief was destroyed by Lieutenant Colonel Henry's confession and death, he handed in his resignation, for he still maintained that Dreyfus was guilty. He said he had other proof of guilt than that which he had advanced. It will be remembered that the supplementary proof which he urged in his speech, viz., the alleged confession to Lebrun-Renaud, was seriously impaired by rebutting testimony. The governor of the prison in which Dreyfus was confined had denied the existence of this alleged confession, and it rested at best on very slender evidence. Nevertheless, Cavaignac said of it that "either human testimony has no longer any value" or Dreyfus had admitted his guilt.

CAVALLOTTI, FELICE CARLO EMANUELE, Italian poet and publicist, was killed in a duel with swords with Signor Macola at Rome, May 6, 1898. He was born at

Milan, November 6, 1842. At an early age he published poems revealing a hatred of Austria and took part in the struggle for independence. In 1871 he published the patriotic drama *I Pezzanti*, which was the first of a number of plays written by him. He wrote *Anticoglio*, a volume of poems political and lyric. Subsequently his writings were collected and published as "*Oeuvres Complètes*." He was a Radical, was repeatedly a member of the Italian parliament, and always an opponent of Signor Crispi. The duel resulted from a newspaper controversy between him and Signor Macola, he being editor of the Milan *Seculo* and Macola of the *Gazzetta Di Venezia*.

CELEBES is a large island in the Eastern Archipelago of the Pacific Ocean lying east of Borneo and having an area of 71,470 square miles, with an estimated population at the end of 1895 of 1,997,860. For administrative purposes it is divided into two residencies in accordance with the Dutch system for the administration of the colonies. The whole of the island is practically under the control of the Dutch, but only a small portion of it is under their direct administration, many of the petty princes being permitted to manage local affairs. The part directly under Dutch administration contains the towns of Menado, Port Rotterdam, and Vlaardingen or Macassar.

CELL (VEGETABLEQ. See BOTANY (paragraphs Cytology, Histology and Morphology, and Plant Physiology).

CEMENT. *Portland Cement.*—The production in 1897 amounted to 2,677,775 barrels, valued at \$4,315,891, which was an increase of nearly 74 per cent. over 1896. This was supplied by twelve States, but most of it came from the Lehigh Valley region in Pennsylvania. There are now 29 factories in the United States, but their output in 1896 supplied only 34.7 per cent. of our entire consumption, whereas in 1897 it furnished 56.8 per cent. The imports in 1897 were only 2,090,924 barrels, a decrease of 900,000, and these came chiefly from Great Britain, Germany, Belgium and France. The prejudice which once existed against the American product has practically disappeared, and much of it shows decidedly higher tests than the imported article.

Rock Cement.—The output of this material in 1897 was 8,311,688 barrels, valued at \$3,862,392, and was the largest production known, notwithstanding the fact that rock cement has been superseded to a large extent by Portland cement.

CENSUS OF THE UNITED STATES. On December 27, 1898, an important report relating to the scope and method of the Twelfth Census was presented to the American Economic Association at its eleventh annual meeting in New Haven, by a committee of the association consisting of Prof. R. Mayo Smith of Columbia University, Prof. W. F. Wilcox of Cornell University, Prof. R. P. Falkner of the University of Pennsylvania, Prof. D. R. Dewey of the Mass. Institute of Technology and Hon. C. D. Wright, U. S. Commissioner of Labor. The report contained a number of recommendations for the work of future censuses, and these were quite fully discussed by various members of the association. Naturally the report contained criticisms of certain features of the eleventh census, relating not so much to the accuracy of the census returns as to the methods of treating the data. It called attention to the fact that insufficient time was allowed by law for preparing plans and schedules, and work was required of the census authorities which should have been transferred to established departments or bureaus which were familiar with the subject matter and possessed a trained force for conducting investigations. By multiplying the lines of inquiry to be pursued in the census the work was seriously impeded. Among the defects pointed out by the committee were: (1) The irregularity in the system resulting in the grouping of occupations under different heads from census to census, making comparison difficult or impossible. (2) "Lack of co-ordination," resulting in different methods of presenting the subject, so that certain classes of facts investigated in some cases were omitted in others. (3) "Faults of method." As instances of these were cited the attempts to "obtain the annual rates of crimes, births, and deaths by direct enumeration at a given time without recourse to registration or other continuous records," the asking of questions that are not likely to be correctly answered, such as the degree of intermixture of white and negro blood; defective tabulations of material; defective classification, etc.

In the discussion that followed it was asked if it were possible to obtain statistics of capital and industry. It was pointed out that the weakest portion of the census returns related to statistics of manufactures, a matter which is involved in the greatest difficulty owing to the inadequate and defective nature of the statistics and their liability to be misunderstood. "Such is their construction," said the author of a paper on this subject, "that in a series of problems which increasingly occupy public attention—those which have to do with either the relations of labor and capital or the contention of individualism versus collectivism—either side can

prove from them, or thinks it can prove, practically any proposition it chooses to advance." He added, however, that the prospect of improving this class of statistics was not altogether hopeless, saying "that two things may encourage us in spite of this outlook; one is the fact that defective as they are, our manufacturing statistics are the best produced in any country; the other that since 1860 they have steadily improved from decade to decade." One of the great difficulties of course in the returns obtained in this line of investigation has been the lack of a unit of measurement on account of the fluctuation in the value of the medium of exchange. The writer just quoted pointed out that "there have been no two censuses at which the dollar represented the same quantity of goods or in the matter of wages the same purchasing power." Further difficulties are that of determining what constitutes manufacturing and that of deciding upon methods and phraseology which shall be uniform throughout investigations.

CENTRAL AMERICA. The territory of Central America nearly equals that of France, while the population is less than that of Belgium, but the agricultural conditions are so promising that it is said that the area which now supports about three million people could readily accommodate ten times that number. The country seems to enjoy the advantages not only of a most excellent geographical position, rich soil, extensive coast lines, and great mineral wealth, but a climate that is both agreeable and healthful. The fact that the land rises from the sea to points 11,000 feet above the sea level, explains how products of the tropical, sub-tropical, and temperate zones can all be raised with advantage. Those who are interested in Central America maintain that a brilliant future awaits her, and this will probably prove to be true unless the industrial conditions are spoiled by the political characteristics of the people, who thus far, it must be said, have shown no great success in maintaining a stable democratic government.

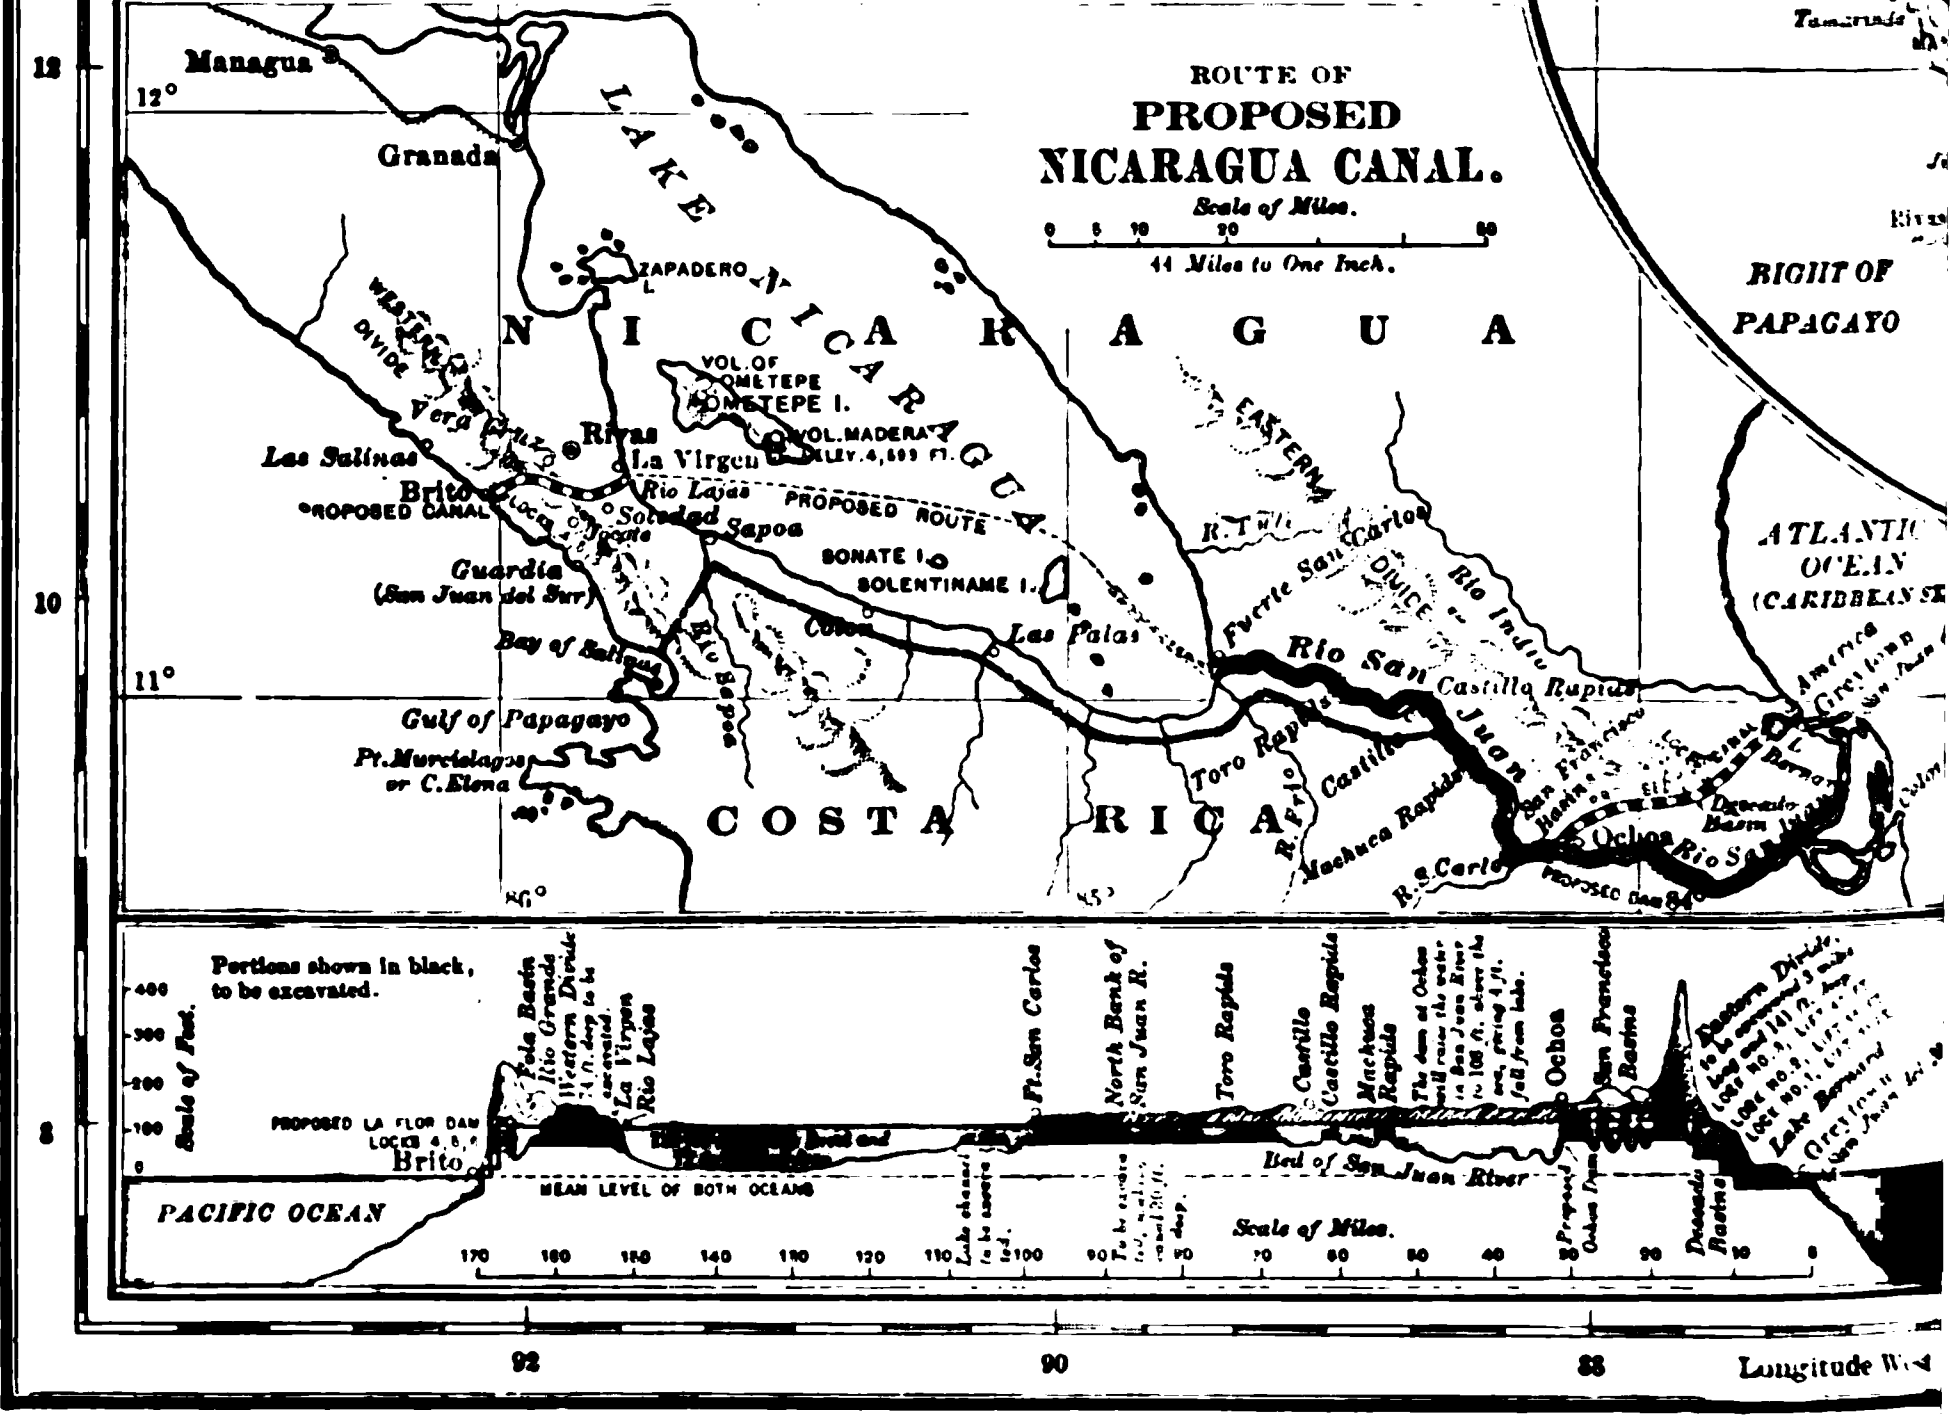

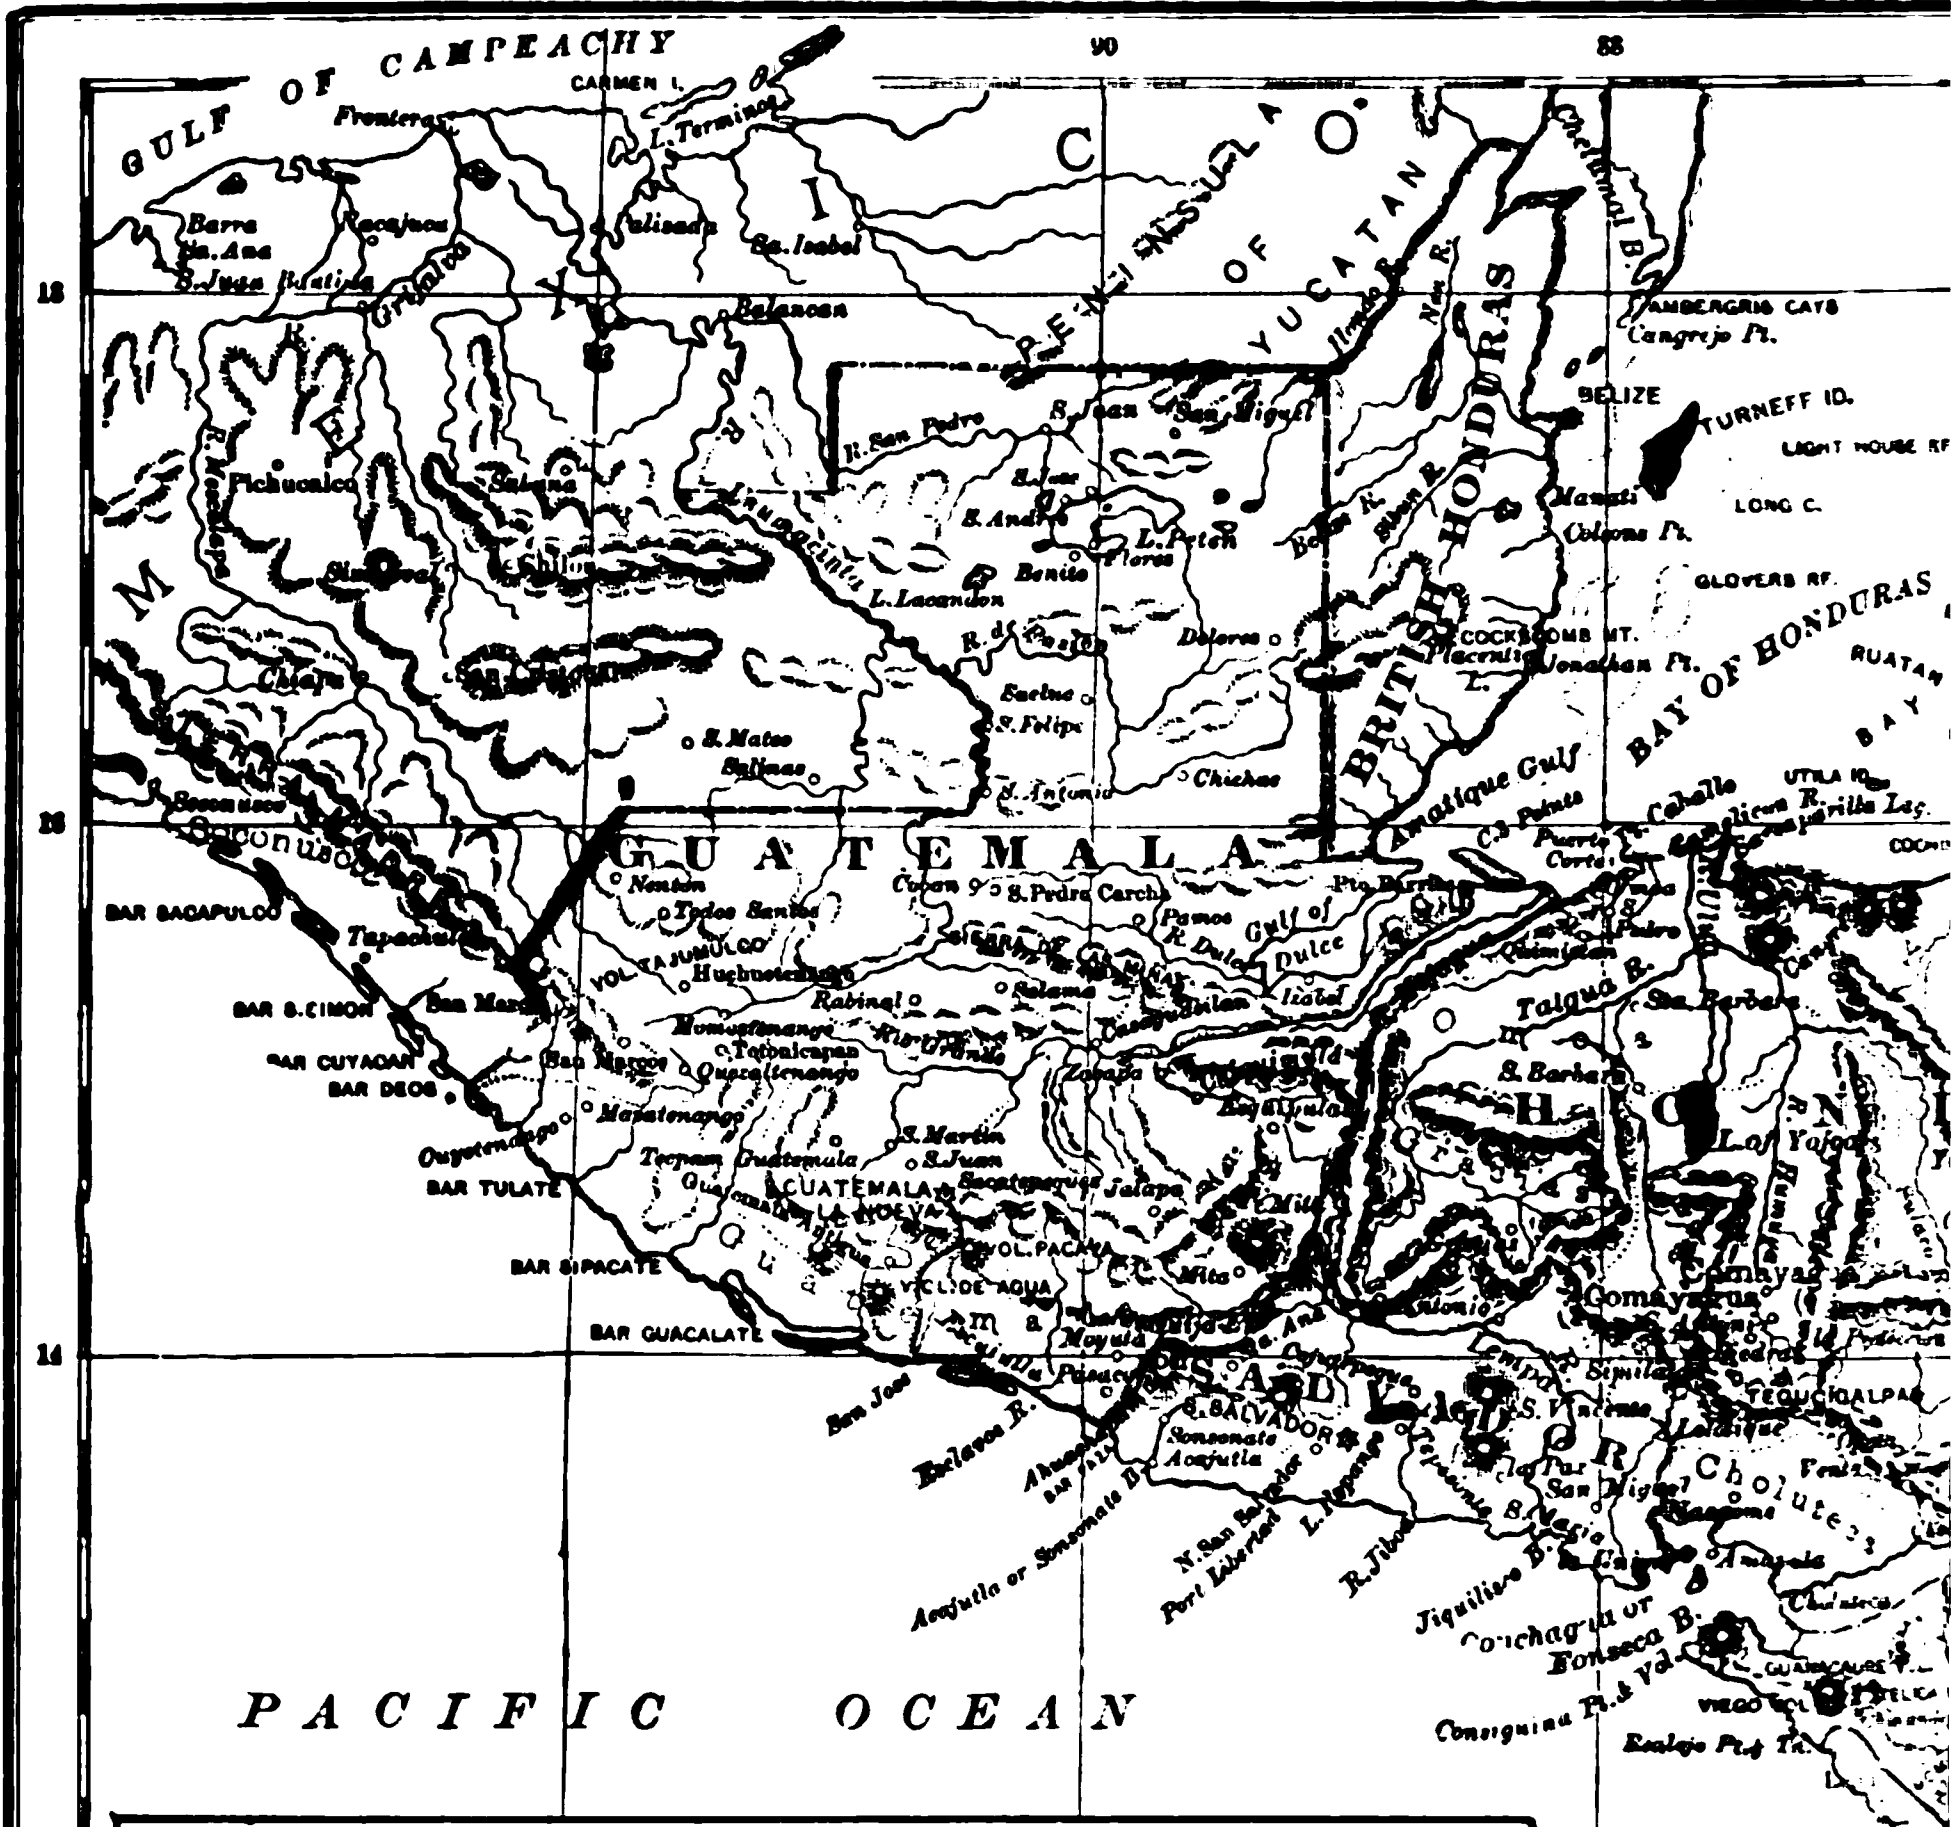

Railway Development.—The commercial importance of the country has been increased by the construction of railroads and will be further improved when those now building are completed. The principal railroads in Central America in 1898 were as follows: In Guatemala—the Southern Railroad, seventy-five miles in length, traversing Escuintla, connects the Pacific port of San José with the capital, Guatemala City; the Western Railroad, forty-one miles in length connects the port of Champerico with San Felipe; there is a branch of the Southern Railroad from Escuintla to Patulul and a road from Iztapa to Naranjo, and a section of 125 miles of the Northern Railroad between Puerto Barrios to Rancho de San Agustín. In Honduras there is a road between Puerto Cortés and San Pedro Sula. In Salvador a road connects the port of Acajutla with Santa Ana; Armenia has railway communication with Ceiba, and Santa Tecla with San Salvador, the capital. Nicaragua has what is said to be an excellent railroad, divided into two sections. The first, fifty-eight miles in length, connects Corinto with Momotombo on Lake Managua; the second section covers a distance of thirty-three miles, connecting Granada to Managua, the capital. Small steamers connect this place with Momotombo. In Costa Rica there were in 1898 two railroads in operation; the one, 117 miles in length, extends from Port Limón through the capital San José to Alajuela; the other, fourteen and one-half miles long, unites Esparta with the Pacific port Puntarenas. The more important lines in process of construction in 1898 were as follows: In Guatemala the Northern Railway, between Guatemala City and Puerto Barrios on the Atlantic was almost completed. The assassination of President Barrios delayed work on this road, but in April 135 miles had been finished and put in operation, sixty miles remaining unbuilt. Early in the year in Salvador a road 124 miles long connecting the port of Unión with the capital was almost completed, while work had been begun on a section between Ceiba and Santa Tecla. In Nicaragua the road between Masaya and Jinotepe was finished and opened for traffic in the latter part of the year. In Costa Rica work was begun on a line connecting the Caribbean with the Pacific coast. It is expected that these roads and others which will probably be constructed, connecting the rich interior districts of the several republics, will stimulate agriculture and commerce and will be a large factor in bringing about the permanent prosperity of the country.

Production and trade.—The same kinds of produce are raised in each of the Central American Republics, but some excel others in the cultivation of particular products. The principal products are coffee, all tropical fruits, but especially the banana, and sugar, cacao, indigo, corn, tobacco, hides, lumber, dyewoods, and rubber. Though coffee is the chief product throughout the country it is especially important in Guatemala and Costa Rica. In 1892 the yield in Guatemala was 36,999,464 pounds, and in Costa Rica the annual exports of coffee aggregate nearly 40,000,000 pounds. In Honduras the coffee produced is excellent but of limited quantity. The yield for 1898 in Nicaragua was estimated at 4,000,000 pounds. The industry is growing in this republic, American companies and individuals having invested as early as 1897

a total of \$560,000 (gold) in coffee culture. The coffee exported to the United States in 1897 was valued in gold as follows: from Guatemala \$1,862,589, from Honduras \$847,230, from Salvador \$1,112,534, from Nicaragua \$1,262,701, from Costa Rica \$3,439,374. Excellent cacao is produced in all the republics, especially in Guatemala, but little is exported. Cattle raising, especially in Honduras, is an important industry; it should be said, however, that both the cattle and the horses of Central America are undersized, as a result, it is believed, of "in-breeding." The country is well known for its tobacco and its immense exports of bananas. This fruit, which is easily cultivated yields large returns, and it is said that there are steamship lines which do little else but transport the Central American banana crop to the United States. As yet there are few extensive mining enterprises in the country, but it is known that all the states are rich in minerals, coal and ores of gold, silver, quick-silver, copper, lead, and iron being very common. Recently much more attention has been paid to mining, and Honduras seems to be the richest in mineral wealth. Formerly Central American trade was almost entirely with Europe, but is now being directed more and more to the United States. American imports into Central America during the fiscal year 1896-97 were as follows: to Guatemala \$2,992,118; to Honduras \$669,682; to Salvador \$1,596,861; to Nicaragua \$1,038,664; to Costa Rica \$1,292,709.

The Federation Movement.—It will be remembered that in 1895 the republics of Honduras, Salvador and Nicaragua combined to form the "Greater Republic of Central America" for the purpose of facilitating foreign relations, preventing disputes among the sister republics and providing for the common defense. The treaty establishing this union provided that if the republics of Guatemala and Costa Rica should accept the agreement all should constitute a new federal State. On June 15th, 1897, these two States formed a treaty with the Greater Republic of Central America for the establishment of a federal union of all the States of Central America under the name of the Republic of Central America, each signatory retaining its autonomy in internal administration. No government was formed under the terms of this treaty, and the nearest approach to federal union was still represented by the Greater Republic of Central America. The Constitution of this body provided for the establishment of a diet composed of members elected by the legislatures of the republics. It was stated in the Constitution that the attributes of this diet should have for their principal object the maintenance of harmony with other nations. In general, the Constitution provided merely for a union in respect to foreign affairs. It did not constitute a true national union, and it was not regarded by the State Department of the United States as creating a separate government with attributes of sovereignty. It was therefore proposed to adopt a genuine Constitution, and on the recommendation of the diet a general assembly was held for this purpose on June 20, 1898. By August 27th the Constitution of the new republic was ready. By this Constitution, the three States, Nicaragua, Salvador, and Honduras, became the component parts of a federal republic, under the name of the "United States of Central America." The Constitution of the United States was evidently taken as a model. The chief executive authority was vested in a president elected by popular vote for a term of four years. His functions were to correspond in general to those of the president of the United States. The first inauguration under the Constitution was appointed for March 15, 1899. The Constitution was to go into effect on November 1, 1898, and in the interval between that date and the following March the executive power was to be vested in a commission chosen by the general assembly, consisting of three members, one from each of the States of the union. The presidential election was appointed for the first Sunday in December. The legislative power was entrusted to a Congress made up of two houses, like the Congress of the United States, and a federal judiciary was also modeled upon that of the United States. The relation of the chief executive of each of the three States was to be analogous to that between a State Governor in the United States and the government at Washington, and each State was to have a legislature and exercise control over its own local affairs.

This action on the part of the three States caused much comment in the United States, where it was viewed as a hopeful indication that peaceful relations between the States of Central America would prevail in the future. But the new republic was short-lived. It came into existence on November 1st when the president of the diet of the Greater Republic formally surrendered the powers of that body to the commission in which executive authority was vested until the first presidential inauguration. The federal district formed by the cession of a small portion of their property by the three States was to comprise the coast of the gulf of Fonseca, and the capital was to be Amapala. The latter place seemed to be inaccessible, and the capital was removed to a part of the district which had been Nicaraguan territory. Salvador was dissatisfied with this change and for a number of other reasons, including the fact that she would have to bear a large proportion of the expense of the administration, had been lukewarm in her support of the new republic. About the middle of November an electoral campaign in Salvador was going on and, as usual, took the

form of a revolution. As a result of it the revolutionists seized the government. The executive commission of the Federal republic called upon Honduras and Nicaragua to put down the revolt in Salvador. A slight and wholly ineffective military campaign followed and the effort to coerce Salvador was soon given up. On December 1, the Federal commissioners met and decided to dissolve the union. The government of Salvador, while declaring that the Federal republic had been opposed to the vital interests of the Salvadoreans, said it would maintain to the best of its power the friendly relations with the other Central American states, and was ready to combine in a new union as soon as it should be sanctioned by the people.

CENTRAL ASIA. The publication in 1898 of the accounts of explorations in Central Asia by Dr. Sven Hedin and Mr. A. H. Savage Landor drew public attention to the progress of discovery in that region in recent years. This part of the world was, until a short time ago, almost unknown to western peoples. Now the main geographical features of the country have been mapped out through the energy of a large number of explorers, mainly Russian and British. There are still parts of the region, however, which offer fields for further research. The exact character of the mountain ranges in eastern and northeastern Thibet and of the river region running northward from the Indo-Chinese peninsula are little known. In recent years attempts have been made to supply these deficiencies. One of the most remarkable of recent expeditions was that undertaken by the Hon. W. W. Rockhill, the present United States Minister in Greece, who travelled over a vast distance in Eastern Thibet and penetrated to a point not far from the mysterious city of Lhasa, the center of Lamaism, and made a careful study of Thibetan customs and religion. At nearly the same time the country was crossed from north to south by Prince Henry of Orleans and M. Boubalot; and soon afterwards a British officer, Captain Bower, travelled across the Thibetan plateau from west to east. Mr. Little-dale and his wife still more recently travelled through Thibet and came within a short distance of Lhasa, and later still an exploration was made by two British officers, Captain Welby and Lieutenant Malcolm, who traversed the central plateau from west to east by a northerly route.

More interesting, if not more important, than these expeditions was that of the young Swede, Dr. Sven Hedin, who after careful scientific training and a close study of geography both in Sweden and in Germany, made a preliminary expedition to Kashgar in 1889-90. Returning to Sweden and securing financial aid from the king and some private individuals, he again set out for the east in October 1893. He applied himself to the study of that little known region of lofty mountains called the Pamirs, and to the tracing of the tributaries of the Oxus. He made a daring attempt to reach the summit of the highest mountain of the Pamirs, Mustag-ata, which rises 25,000 feet from the plateau. Undeterred by the warning of the Kirghiz, the natives of the district, who had many superstitious notions in regard to the mountain, he started on the ascent in company with a few volunteers. He made three attempts, on the first reaching an altitude of 16,000 feet, and on the second and third 20,000 feet, but the extreme difficulty of breathing in the rarified air and the inability of his companions to climb further led him to give up the undertaking.

After a winter at Kashgar he explored the country between the Kashgar and Yarkand rivers, adding much to the geographical knowledge of those regions. In the spring of 1896 he entered the Takla-Makan desert lying between the Yarkand and Khotan rivers, accompanied by four men. The party suffered the severest hardships, having exhausted their water supply and being obliged to grope their way over an absolutely bare and sandy desert. Water was discovered just in time to save his life and he made his way with two survivors to the town of Khotan. He afterwards crossed the desert again from south to north coming out at the river Tarim, whence he went on to the lake region of Lob-Nor, from which he returned to Khotan. In his journeys across the desert he found many interesting and valuable relics pointing to the existence at one time of flourishing cities and fertile fields in this now barren land. From Khotan he passed through a country which had been for the most part unexplored to the Kuen-Lun mountains, through Tsaidam and Koko-Nor to the Hoang-Ho river, whence he passed on to Peking and journeyed home through Siberia.

The records of his journey are remarkably interesting as well as scientifically valuable. He brought back a great number of photographs and sketches and an abundance of data of geographical and ethnological importance. From geographical societies as well as from the government, he received the highest honors.

The expedition of Mr. A. H. Savage Landor resulted in even more exciting adventures. Mr. Landor is the grandson of Walter Savage Landor the great writer. He has spent a large part of his time in Italy where he owns an estate near Florence. Though slight in build and of delicate appearance, his endurance of hardship was remarkable, long years of training having fitted him for the exhausting work of

an explorer. His first venture was a journey among the "hairy Ainos" of Japan, about whom he afterwards wrote a book. The means for his travels in Thibet were supplied by Mr. Alfred Harmsworth the proprietor of an important London newspaper. Mr. Landor started from England in the spring of 1897. He entered Thibet from northwest India eluding the vigilance of the authorities who guarded the frontier. His object was to reach the forbidden city of Lhasa. Taking his course along a stream which appeared from its general direction to flow toward the Brahmaputra, he made rapid progress at first, but he suddenly found himself in the hands of enemies, and deserted by his friends. He was roughly used and carried toward Lhasa. When within a short distance of the city he was tortured by his captors who racked his limbs and nearly destroyed his eyesight by a red hot iron. This, he said, was by the direction of the high Lama and preparations were made for completing the work by decapitation, but for some reason or other his tormentors changed their minds, and binding him in a spiked saddle astride a pony, started him toward the frontier where he was met by a friendly party. Even in the midst of his extreme sufferings, it is said that Mr. Landor kept constantly in mind the object of his expedition, noting the features of the country and preserving through all his hardships his maps and photographs. The account of his adventures seemed so improbable that in some quarters they were received with incredulity, but geographers of high authority have accepted his statements.

CENTROSOME. See BOTANY (paragraphs Centrosomes and Blepharoplasts, Spermatozoids in Gymnosperms, Cytology).

CERVERA Y TOPETE, PASCUAL DE, Conde de Jerez, Marquis de Santa Ana, the Spanish admiral defeated at Santiago de Cuba, July 3, 1898, was born about sixty-six years ago in the province of Jerez, Spain. His father was a man of great wealth, and his mother, Marie Topete, belonged to a branch of the royal family. Cervera's advancement is said to have been due to these facts, although he is recognized as a man of no mean ability. He was graduated from the naval academy at San Fernando, Spain, in 1851; his first campaign occurred in 1859 when he accompanied the Spanish expedition to Morocco, and rose to the rank of first lieutenant. In 1862 he went with an expedition to Cochin-China; promoted to a captaincy, he commanded a vessel off the Peruvian coast in 1868-70, and was then transferred to blockade duty in Cuban waters, the Ten Years' War having broken out some two years previously. Being later recalled from Cuba, he became Minister of Marine in the Spanish cabinet, and subsequently was put in command of the battleship *Pelayo*, the construction of which had been carried on under his direction. He has been adjutant to the Queen Regent, and several years ago was chairman of the Spanish naval commission sent to London to confer upon naval matters with similar commissions from other powers. Cervera has been recognized as the foremost naval commander of Spain. After the battle of Santiago he was taken to Annapolis, Maryland, and then to Portsmouth, New Hampshire, where most of the Spanish prisoners had been sent. On September 12, 1898, with over 1,700 other Spaniards, he sailed for Spain. On account of his courteous and dignified bearing while in the United States, together with the fact of his terrible defeat, public feeling for Cervera became almost kindly. Whether or not he was compelled by governmental order to leave Santiago harbor it still an open question. For further facts concerning Cervera in 1898, see SPANISH-AMERICAN WAR, (paragraphs Beginning of the War and Destruction of Cervera's Fleet).

CEYLON is a large island and British colony in the Indian ocean to the southeast of the peninsula of Hindoostan, with which it is almost joined by the chain of reefs known as Adam's Bridge. The waters lying between it and Hindoostan are known as the Gulf of Manaar and Palk's Strait. It has an area of 25,365 square miles with a population in 1891 of 3,008,466 of whom 6,068 were English, 21,231 Eurasians, that is descendants of Europeans, while the most numerous element of the natives were the Singhalese numbering over 2,000,000. Other tribes are the Tamil immigrants and settlers numbering 723,853, the Moormen numbering 216,156, and Malays, Veddahs and other races. A considerable part of the land is under cultivation and produces rice and other grains, coffee, tea, cocoanuts, cinnamon, tobacco, cinchona, etc. Among minerals plumbago is important. Pearl-diving was formerly a very productive industry yielding in 1891, 960,000 rupees, but since that date it has been of no importance. The chief exports are coffee, tea, plumbago, cocoanut products, areca nuts, and cinchona. In 1896 the revenue was 21,974,573 rupees and the expenditure 21,237,860 rupees. The chief items of revenue are the customs, licenses, sale of government timber and salt, stamps, receipts from the government railway, etc. The government is administered by a governor and an executive council of five members, and the legislative power is vested in a legislative council of seventeen members. In 1895 the Right Hon. Sir Joseph West Ridgeway was appointed governor. The majority of the inhabitants are Buddhists, which is the faith of the Singhalese. The Hindoos are next to them in point of numbers and then come

Christians and Mohammedans. Plans have been in progress for adjoining the mainland with the railway system of the island and the subject was discussed in 1897. The new line would be constructed on Adams' Bridge.

CHAGOS ISLANDS. See MAURITIUS.

CHALMERS, GENERAL JAMES RONALDS, politician and Confederate veteran, died at Memphis, Tennessee, April 9, 1898. He was born in Halifax county, Virginia, January 11, 1831; was graduated with the class of '51 at the College of South Carolina and in 1853 was admitted to the bar. The year previous he was a delegate to the Democratic national convention which nominated Franklin Pierce for President. In April 1861 he was elected colonel of the Ninth Mississippi Regiment and early in 1862 became a brigadier-general. He was engaged in almost every battle of the Army of the Tennessee, made six assaults at Shiloh, and was severely wounded at Murfreesboro. It has been alleged that he and General N. B. Forrest were responsible for the massacre of Union troops at Fort Pillow, March 26, 1864. He was a member of the Mississippi Senate in 1876-77. General Chalmers was a Democratic member of the XLIVth and XLVth Congresses, was deprived of his seat in the XLVIIth, and of his certificate of election to the XLVIIIth.

CHANOINE, GENERAL, the successor of General Zurlinden in the Brisson cabinet. One of the first acts of his administration was the transfer of Col. Picquart's trial from the civil to the military authorities. A sensational story characteristic of the times, was circulated, to the effect that he had unwittingly signed the papers in this case, which had surreptitiously been placed upon his desk by Gen. Zurlinden's orders when the latter gave up the office. See FRANCE (paragraphs on History).

CHAPLEAU, SIR JOSEPH ADOLPHE, K. C. M. G., Q. C., LL. D., prominent Canadian politician, died in Montreal, Quebec, June 13, 1898. He was born in Ste. Thérèse de Blainville, Terrebonne county, Quebec, November 9, 1840; was educated at Terrebonne and at St. Hyacinthe College; in 1861 he was admitted to the bar and practiced in Montreal. He represented Terrebonne in the Quebec legislature in 1867, and in February 1873, became Solicitor-General in the Ouimet administration. It was also in this year that he was made a Q. C. by Lord Dufferin. He was provincial secretary under M. de Boucherville from January 1876, to March 1878, at which time, the ministry being dismissed by Lieut-Gov. Letellier de St. Just, Sir Joseph was chosen leader of the Conservative opposition in the Quebec assembly. He retained this position until October 1879, when he was appointed Provincial Premier. In 1882 he entered the Dominion House of Commons; in 1891-92 he was in the Abbot ministry first as Secretary of State and subsequently, for a short time, as Minister of Customs. He became by appointment Lieutenant-Governor of Quebec in December, 1892, and remained in that position until his retirement in February 1898. He was succeeded by Hon. Judge Jetté.

CHARCOAL (in the purification of spirits). From a series of experiments made by M. Glasenapp it has been shown that charcoal does not absorb fusel oil, but acts chemically by reason of the oxygen condensed in its pores. The fusel oil is oxidized to ketones and aldehydes, and the latter partially to acids, which then to some extent, act on the alcohols, forming compound ethereal salts (compound ethers). These various mixed products cause the characteristic odor and taste. Charcoal absorbs these products to a large extent; in fact filtered spirits often show less aldehydes than the unfiltered sample. The author advises treating the regenerated charcoal in a current of dry air so as to thoroughly impregnate it with oxygen.

CHARITIES. *Municipal and County Charities in the United States.*—The material is lacking for a complete account of the nature and comparative efficiency of the public institutions of charity in the cities and counties of the United States but the National Conference of Charities and Correction has covered a part of the field in a report which appeared in May 1898. This report deals with the municipal and county charities in the seventy-three cities of the United States which had a population of more than 40,000 in 1890. Some of the general conclusions of the committee which made the investigation are of interest. The National Conference had previously investigated municipal charities and published a report on the subject in 1888. This report pointed out the inferiority of the municipal charities to those of the State and gave as the reasons for this inferiority the less adequate appropriations, the inferior classification, the government by committees of boards of supervisors instead of independent boards of trustees and the greater liability to interference by partisan politicians. As to the inferiority of the municipal charities, the conclusion of the committee in 1898 was the same as that advanced in the earlier report. Nevertheless the municipal charity work showed an improvement in common with the other departments of municipal activity under the influence of the new progressive ideas.

A comparative study of the municipal charitable institutions of the United States reveals at once the different system in operation in the New England States from that

which prevails in the Central and Western States. In the New England States the municipal government administers poor relief. In the Central and Western States where the county system has prevailed the cities have remained merely administrative parts of the counties in respect to all matters of poor relief. Thus in Chicago there are no municipal charities. The almshouse, and hospital and insane asylum are managed by Cook county, which also distributes outdoor relief in the city. In this latter respect, however, Chicago differs from most of the cities of the Central and Western States since outdoor relief is with them a municipal function. Of the first ten cities in point of population (according to the census of 1890) eight manage their own charities, while the remaining two, Chicago and Buffalo, are merely parts of counties. In the cities which manage their own charities there has been established a department of charities which takes its place by the side of the other municipal departments, but while the tendency has been toward an independent municipal management of poor relief, there has also been a tendency for the State to assume control of two special classes of dependents, namely, the children and the insane.

As to the efficiency of the municipal administration of poor relief, it may be said that the department of charities has been administered with about the same degree of ability as the other municipal departments. Where these other departments have been managed in a corrupt and inefficient manner, the department of charities has been no exception to the rule. It has suffered as much from partisan administration as any of the other public departments.

Under the impulse of municipal reform, improvements have been introduced here as in the other branches of the cities' administration. Conspicuous instances are the reorganization of the charities of New York City and Boston and the improvement secured for the charities of Baltimore in the provisions of the new charter which will take effect January 1, 1900. One sign of the more rational ideas which are gaining ground in charity administration is the tendency to differentiate the classes of the dependents. It seems to be recognized that the placing of two or more of these classes, which of course require entirely different kinds of administration, under the control of a single head is a bad plan. There is therefore a tendency to place the destitute, the insane and the criminal classes each under separate administrative control. In New York City this division has been recognized. The insane have been turned over to the control of the State, and the department of Charities and Correction has been divided into two departments, one of Charities and the other of Correction. In Boston there are five separate departments, namely: for adult paupers, for destitute children, for the insane, for criminals, and a department for investigation, registration, etc. On the other hand, an illustration of the failure to apply this principle is afforded by Chicago where the county gives to the same board of commissioners the control over the almshouse, insane asylum, county hospital, the building of roads and several other important matters.

Another point discussed in the report of the committee was the relative efficiency of an administration by means of a board of unpaid trustees and an administration conducted on the same principle as the other municipal departments, that is by means of one or more salaried commissioners. The former method is employed in Philadelphia, Boston, Baltimore and San Francisco, and the latter in New York, St. Louis, and Cleveland. The point urged on behalf of the unpaid board is that there is less chance for the entrance of partisan politics into appointments. And it is also presumed that the men appointed to these positions will have a wider knowledge and show a more disinterested spirit in the administration. These considerations, however, are mainly theoretical. Experience has not proved that the unpaid board is free from partisan influences. Moreover the volunteer officer is often apt to shirk duties for which he receives no payment, and there is frequently a bad result from the division of responsibility. The concentration of charity administration and the payment of officers seemed to the committee more in line with municipal development in the United States and in spite of the danger from the spoils principle, to have the advantage in respect to the promptness of service and the chance for executive ability to make itself felt. This concentration of authority of course lays the responsibility clearly on the executive and the public knows exactly on whom to place the blame for shortcomings.

The main emphasis was laid by the committee not on the matter of organization, but on the attitude of the people toward charitable work. The improvement in this work during the past ten years was, in their opinion, due to the greater interest of the people in the subject. The work of municipal charities has been brought powerfully to the attention of the people and a public sentiment in their favor has been aroused. There is, furthermore, a more watchful spirit among the people than before.

The limits of this article will not admit of a description of all the cities included in the committee's report. Some idea of the subject, however, may be had from an account of the charitable activities of the first ten cities in order of size:

New York.—The public charities of New York City are administered by three salaried commissioners, each having exclusive administrative control in different divisions of the city, namely: one in the Boroughs of Manhattan and the Bronx, one in the Boroughs of Brooklyn and Queens, and one in the Borough of Richmond. They are appointed by the Mayor for six years and are subject to removal without assignment of cause for the first six months of that time, after which they can be removed only for cause. The appointment and removal of subordinate officers in the district of which he has charge is wholly in the hands of each commissioner. The committee gives the following list of institutions in New York City showing the number of inmates toward the close of the year 1897:—

In the Boroughs of Manhattan and the Bronx.	
Bellevue Hospital.....	709
Gouverneur Hospital.....	40
Harlem Hospital.....	42
Fordham Hospital	26
City Hospital.....	695
Metropolitan Hospital.....	440
Almshouse	2,285
Infants Hospital	422
Children's Hospitals and Schools on Randall's Island.....	856-5,515
In the Boroughs of Brooklyn and Queens.	
Almshouse	1,337
Hospital	459-1,796
In the Borough of Richmond.	
Almshouse	113- 113
<hr/>	
Total in New York City.....	7,424

The total appropriations for these institutions for 1898 were \$1,671,213.

According to the new charter the commissioners are forbidden to dispense any kind of outdoor relief except to the adult blind and for transportation of non-residents. In respect to destitute and neglected and wayward children, it is the city's custom to place them in institutions under private control and allow \$2.00 a week for their support. In 1898, according to the committee's report, there were twenty-five of these institutions in the Borough of Manhattan and the Bronx. And the average number of inmates was 15,000, the support of whom costs the city about \$1,600,000 a year. Children over two years of age are for the most part committed to these institutions by magistrates. In Brooklyn a similar plan is followed. In the Borough of Richmond (Staten Island) it has been the custom to board destitute children in private families subject to supervision by members of the State Charities Aid Association.

Since 1896 the city has maintained a municipal lodging house on First avenue near 23d street, where each lodger is subjected to a medical examination and obtains a bath and a clean bed.

The Department of Correction, with one salaried commissioner at its head whose term is also for six years, controls the correctional institutions in New York City, including the "Tombs" prison, five district prisons, the New York County Penitentiary, the Kings County Penitentiary, and the New York City workhouse. The care of the dependent insane is in the hands of the State which controls twelve hospitals for this purpose. The inmates numbered 20,843 on October 1, 1897. The administration is by means of unpaid boards of managers appointed by the Governor under the control of the State Commissioner of Lunacy, which has three paid members also appointed by the Governor. In New York City the dependent insane are confined for the most part in the Manhattan and the Long Island State Hospitals.

Chicago, Ill.—Here, as has been said, the administration of charity is in the hands of the county, which includes a somewhat wider district than the city. The County Board, which consists of fifteen salaried commissioners, manages the institutions through officers appointed by its president. These officers are three in number and comprise the Superintendent of the County Infirmary and Insane Asylum, the Warden of the Cook County Hospital and the County Agent for Outdoor Relief. The inmates in the county institutions on January 1, 1898, numbered 3,822 of whom 1,482 were in the Infirmary (Almshouse), 1,445 in the Asylum, and 895 in the Hospital. The cost of managing these institutions for the year 1897 was \$718,872. The county also spent \$44,000 in contributions to industrial schools. The city of Chicago contributes little to charitable work and it gives no outdoor relief. The county distributed \$136,200 in outdoor relief in 1897. The Cook County Commissioners administer both the charitable and correctional institutions of the city. The care of the

insane is a charge on both the city and the county, the State allowing each county to send a certain number of the insane to the State institutions, but requiring them to retain or take back cases when the accommodation in the State hospitals becomes inadequate. The police department dispose of the destitute children, sending them to the St. Vincent Orphan Asylum; the Foundling's Home, the Visitation and Aid Society, the Humane Society and the Home of the Friendless. The number of children placed in these institutions in 1897, together with a few for whom homes were found in private families, was 231.

Philadelphia, Pa.—In Philadelphia proper the relief of the poor is in the charge of a Department of Charities and Correction consisting of five unpaid directors appointed by the Mayor for five years and divided into a Bureau of Charities and a Bureau of Correction, each composed of the president of the department and two directors. The number of inmates in the city institutions on January 1, 1898, and the expenses of management during the previous year were as follows:—

Philadelphia Almshouse and Hospital.....	4,068	\$503,127.01
House of Correction (semi-penal).....	1,611	229,563.60
Municipal Hospital for Contagious Diseases.....	173	75,134.69
	<hr/>	<hr/>
	5,852	\$807,825.30

A considerable sum, amounting in 1897 to \$142,675, is contributed by the city to private institutions. The only form of outdoor relief given by the city is free medical treatment. The city maintains no free lodging house but has made an arrangement with the Charity Organization Society whereby tickets are given to homeless persons entitling them to two meals, lodging and bath at the Wayfarers' Lodges. A work test is imposed in connection with the granting of this privilege. In 1897 only \$1,000 was contributed by the city for this purpose. As in Illinois, the care of the insane is a charge on both the county and the State, each sharing the expense about equally. The report gives the number of insane persons in the Philadelphia Almshouse and Hospital as 1,243 on January 1, 1898, while 1,733 from Philadelphia were in State asylums. The majority of the destitute children cared for by the city are supported in private institutions, which on January 1, 1898, contained 349. Temporary care of destitute children is afforded at the Almshouse, and foundlings and sick children are taken at the Philadelphia Hospital. In both these institutions on January 1, 1898, there were 114. A few children have been placed in private families. In the outlying districts of Germantown, Holmesburg, Roxborough, Byberry and Bristol there is an independent administration of poor relief.

St. Louis, Mo.—Here the general supervision of charitable institutions is in the hands of an unpaid board of commissioners of five members appointed by the Mayor, but the direct control of institutions of charity and correction is divided between the departments. The Health Commissioner controls the four public institutions, namely, the City Hospital, the Female Hospital, the Insane Asylum, and the Poorhouse, the number of whose inmates on January 1, 1898, was 2,906, of whom 1,529 were in the Poorhouse. The Board of Public Improvements controls the Workhouse, and a Board of Managers appointed by the Mayor controls the House of Refuge and Correction for Children. The superintendents of charitable institutions are appointed by the Mayor. \$474,236.46 were expended for the four charitable institutions during the year ending April 1, 1897. The city makes no contributions for private charities except in the case of foundlings, for the care of whom it contributed in the year ending April 1, 1897, \$16,199.99. Little outdoor relief is granted and the city maintains no lodging house. Such provision as is made for homeless persons is afforded through the police department. The city takes charge of the insane, of whom at the beginning of 1898 there were 1,332. The House of Refuge and Correction for Children contained 354 inmates on January 1, 1898. The city's foundlings are cared for in private institutions which receive contributions from the city government. The report states that in 1897, 352 foundlings under three years of age were maintained in these institutions and that of these 157 died. This is a very extraordinary death rate as will appear by a comparison with tables of infantile mortality which show that for Great Britain the death rate of children under one year of age was 14.5 per 100 and for Bavaria, where the death rate was highest, 30.6.

Boston, Mass.—Three boards, each composed of seven members, have the care of the poor and the insane in the institutions of Boston, and the overseers of the poor, twelve in number, have charge of outdoor relief. The three boards are the Pauper Institution Trustees, the Insane Hospital Trustees, and Trustees for Children. The term of office for the members is three years and all are appointed by the Mayor. The report gives the following table showing the charitable institutions owned and controlled by the city with their census on January 1, 1898, and the cost of their maintenance for the year ending February 1, 1898.

Institutions.	No. of Inmates.	Cost for Year.
Boston Insane Hospital, Austin Farm.....	338	\$69,582.44
Boston Insane Hospital, Pierce Farm.....	178	47,621.21
Boston Almshouse, Charlestown Almshouse.....	137	14,165.06
Boston Almshouse, Long Island Almshouse.....	828	84,097.74
Marcella Street Home (children).....	461	44,879.97
City Hospital.....	672	192,481.32
Parental School (correctional).....	165	22,997.88
House of Reformation (correctional).....	158	27,265.36
Temporary Home (women).....	26	5,744.46
Wayfarers' Lodge (men).....	41	8,427.06
Small-pox Hospital.....	0	
Galloupe's Island (quarantine)	1	

In 1897 the sum of \$116,722.19 was contributed for outdoor relief. Private charities received no contributions from the city. The city supports two lodging houses. Its correctional institutions are under a separate department. The city takes care of its insane, who on January 1, 1898, were distributed as follows:—

Danvers Lunatic Hospital.....	70	
Taunton Lunatic Hospital.....	91	
Worcester Lunatic Hospital.....	96	
Worcester Insane Hospital.....	153	
Westborough Insane Hospital.....	143	
Northampton Lunatic Hospital.....	1	
Tewksbury Insane Asylum.....	75	
Bridgewater Insane Asylum.....	29	
Medfield Insane Asylum.....	218	
Boston Insane Hospital (not all being city charges).....	516	
Insane Boarders.....	34	
Insane in Almshouse.....	23	
		<hr/> 1,449

In addition to the above there are in

Hospital Cottages (epileptics).....	12	
Hospital for Inebriates (dipsomaniacs).....	67	
School for Feeble-minded	88	167
		<hr/> 1,616

Institutions for children are maintained by the city which also places a considerable number in private families. On January 1, 1898, the Marcella Street Home was caring for 461 children of whom the majority had been placed out at board. During the previous year but two deaths occurred among the children. The State cares for foundlings and abandoned children.

Baltimore, Md.—Important changes were made in the administration of charities by the new charter which is to go into effect on January 1, 1900. The principle adopted is that of management by an unpaid board, the supervisors of city charities, who are appointed by the Mayor for six years. These are to take the place of the present Trustees of the Poor, seven in number and serving for two years. The City Almshouse is the only charitable institution owned and maintained by the city. The cost of its maintenance during 1897 was \$105,000 and on January 1, 1898, the number of inmates was 1,342. A considerable sum is contributed by the city for the maintenance of private charitable institutions and societies, amounting in 1897 to \$106,775. Besides the money spent in these ways there were appropriations for reformatories, for insane hospitals and for the deaf and dumb. The city maintains no lodging house, but temporary lodgings are afforded by the Almshouse or by the Friendly Inn, which is a private institution to which the city contributes \$1,000 each year. Separate authorities have charge of the charitable and correctional institutions. The care of the insane is divided between the city and the State, but there is a tendency to place it wholly with the latter. The destitute children are supported by the city in private institutions.

San Francisco, Cal.—Here, too, there is an unpaid body in charge of poor relief. It is the Board of Health appointed by the Governor for four years. The city charitable institutions contained 1,523 inmates January 1, 1898, and the cost of running the institutions during the previous year was \$161,003.45. Besides this the city contributed \$20,639.50 to private institutions. No outdoor relief is given by the city and there is no lodging house, homeless persons receiving temporary lodgings at the city prisons

and the City Receiving Hospital. The charitable and correctional institutions are administratively distinct. The State has charge of the insane. The State also bears the chief expense of maintaining dependent children, the city having no institution for this purpose under its immediate control.

Cincinnati, O.—The relief of the poor is here in charge of the Superintendent of the Infirmary and six Overseers of the Poor; the latter are a paid body appointed by the Board of Affairs, and not more than three of them can be from any one political party. The city charitable institutions are the House of Refuge, the Hospital, and the Infirmary, which had on January 1, 1898, 1,761 inmates and the cost of maintenance during the year previous was \$275,445.85. The city contributes nothing to private institutions. In outdoor relief it spent during 1897, \$11,946.92. It has no lodging house and homeless persons find shelter in the police stations. The correctional institutions of this city are under separate administration. The care of the insane is divided between the State and the county. Dependent and delinquent children are maintained by the city in the Cincinnati House of Refuge and none are supported by the city in private institutions. A few are placed in family homes.

Cleveland, O.—The Director of Charities and Correction has charge of the relief of the poor. He is a salaried officer appointed by the Mayor. The charitable institutions are the City Infirmary and the City Hospital, which contained on January 1, 1898, 791 inmates and cost the city during the previous year \$93,136.93. The city contributes nothing to private charities. In outdoor relief it expended in 1897, \$39,853.06. There is no lodging house maintained at the public charge and homeless persons are provided for in a private institution. The city does not take care of destitute children. These are provided for by the Cleveland Humane Society.

Buffalo, N. Y.—Here the control of charities is in the hands of the county, the officials in charge being the County Superintendent of the Poor and the Keeper of the Almshouse, who are elected for three years. There is a County Board of Supervisors which exercises general control over the administration of the charities. The city has no institutions for the relief of the poor, but gives outdoor relief through the Overseer of the Poor, an officer elected for a term of four years. The county has one charitable institution, the Erie County Almshouse, with 747 inmates on January 1, 1898, and costing for maintenance during 1897, \$125,245.46. The city contributes to the hospitals alone. The county contributes per capita to the hospitals and the children's homes. For the year ending July 1, 1897, the city contributed \$109,626.98 in outdoor relief. There is no free lodging house and homeless persons are referred to the Charities Organization Society. The State has charge of the insane. The county supports destitute children in private institutions and also places out some in private families through agents employed by the County Board of Supervisors.

State Charity in the United States.—In the United States there is in general no expressed recognition in the constitutions of the several States of the obligation to care for dependent members of the community. The constitution of North Carolina, however, is an exception to this rule. It is there provided in article II, section 7, that "Beneficent provision for the poor, the unfortunate, and orphan, being one of the first duties of a civilized and Christian State, the General Assembly shall at its first session appoint and define the duties of a Board of Public Charities, to whom shall be entrusted the supervision of all charitable and penal institutions, and who shall annually report to the Governor upon their conditions with suggestions of their improvement." In no other State is this so explicitly stated in the constitution. In New York, however, the revised constitution adopted in 1894 declared it to be the duty of the State to supervise the defective, destitute, insane and criminal, and it directed the legislature to provide for State boards or commissions of charity, lunacy and prisons which should visit and inspect all institutions for dependents or delinquents in the State. It was later provided by law that the State Board of Charities should have supervision over all county, municipal and private charities. And the constitution of Nebraska, South Dakota, and Wyoming, each implies the existence of such an obligation on the part of the State by reference to certain administrative bodies which shall control the charitable, reformatory and penal institutions.

The present theory of poor relief both in United States and in England is that the government is under no obligation to do for men what they are able to do for themselves and in the case of able-bodied dependents the attempt is made to make the conditions under which they obtain public relief so unpleasant that they will be unwilling to accept it. This principle is of course in marked contrast to that idea of public charity which obtained in England during the reign of George III when it was the current belief that the government was in duty bound to give either employment or outdoor relief to every idle person. Though charity administration in the United States has made great advances in recent years, it is still far from satisfactory. The presence in the field of the various philanthropic bodies both private and public has led to confusion and in some cases to mistaken charity. A more complete cooperation between philanthropic workers is one of the needs of the time.

While only the States above named have in their constitutions expressed or implied statements of the obligations to provide poor relief, the other commonwealths practically apply this principle in their administration. Recently the State Governments have undertaken the care and treatment of epileptics. Ohio was the first State to do this, having opened an asylum in 1893, and Massachusetts, California and New Jersey have adopted a similar plan. In New York State in 1894 a colony known as the Craig Colony was established for epileptics. It was named after the late Oscar Craig of Rochester, formerly president of the New York State Board of Charities and it is the first institution of the kind established in the United States. See EPILEPTICS.

These five States have acknowledged in their fundamental law the principle that the State has duties to perform to the dependent, defective, and delinquent members of the community. Sixteen other States have practically acknowledged this principle by the establishment of supervisory boards with control over such matters, but in twenty-four States there is no official State control over the care of dependents. In the amount of charitable work done no State equals the State of New York. The supervision of charities is there entrusted to the State Board of Charities, consisting of twelve members appointed by the Governor with the advice and consent of the Senate. This State Board has the power and duty to visit, inspect, and supervise "all institutions, societies, or associations which are of a charitable, eleemosynary, correctional or reformatory character, whether State or municipal, incorporated or not incorporated, which are made subject to its supervision by its constitution or by law." It is empowered to inspect all institutions whether public or private and to enforce a proper administration of them. The following list taken from an article by Mr. Robert W. Heberd, Secretary of the State Board of Charities, published in November 1898, shows the vast amount of real and personal property possessed by charitable institutions in the State of New York:

State Institutions.....	\$5,450,953.60
County Almshouses	2,993,930.00
City and Town Almshouses.....	6,842,000.00
Charity Organization Societies.....	346,082.01
Day Nurseries.....	271,416.46
Dispensaries	1,613,983.17
Fleemosynary-Educational Institutions.....	850,569.07
Employment Societies.....	171,217.76
Fresh Air Charities.....	479,035.96
General Out Door Relief Societies.....	2,274,544.49
Homes for the Aged.....	17,845,107.17
Homes for the Blind.....	244,400.00
Homes for Children.....	25,581,350.33
Homes for Discharged Prisoners.....	161,997.75
Homes—Temporary for Men and Boys.....	124,340.01
Homes—Temporary for Women and Children.....	223,314.45
Homes—Temporary for Women and Girls.....	177,252.00
Homes and Hospitals for Consumptives.....	583,000.00
Homes and Hospitals for Convalescents.....	52,700.00
Homes and Hospitals for Epileptics.....	120,000.00
Homes and Hospitals for Incurables.....	1,611,855.60
Homes and Hospitals for Inebriates.....	488,307.70
Homes and Missions for Immigrants.....	2,441,600.00
Hospitals	29,068,051.55
Humane Societies.....	6,600.00
Legal Aid Societies.....	19,715.00
Reformatories for Children.....	165,578.13
Reformatories for Women and Girls.....	1,618,172.24
Relief for Sick Poor, Societies for.....	335,508.00
Schools for Deaf.....	1,224,691.65
Total	\$103,364,554.21

This by no means shows the extent of the funds appropriated to charitable objects since it does not include the amounts expended through minor church organizations and through various associations such as the King's Daughters and Ladies Aid Societies or by purely personal charities. On October 1, 1897, the same writer gives the number of inmates in the institutions subject to the supervision of the State Board of Charities as 74,674 and this does not include the large number of people who are temporary beneficiaries in the institutions, especially in the hospitals. When these latter are added in, the number of persons cared for by the State in all classes

of institutions was 269,147; and besides this it is said that over a million and a half were treated practically free of charge in the dispensaries of the State, most of them being in Greater New York.

CHARITY ORGANIZATION SOCIETY, organized in 1882, to promote the welfare of the poor. Central Offices, United Charities Building 105 E. 22nd st., New York. Officers of Central Council—Robert W. DeForest, president; Charles S. Fairchild, 1st vice-president; C. D. Kellogg, 2d vice-president; J. Pierpont Morgan, treasurer; Edward T. Devine, general secretary. The Mayor of New York, President Police Department, President Health Department, President Department of Charities, Commissioner of Correction, U. S. Commissioner of Immigration John A. McKim, representing State Charities Aid Association; Professor R. Mayo Smith, representing Columbia University, are ex-officio members. For year ending June 30, 1898, 21,365 applications were received; receipts \$46,959, expenditures \$48,341. 531 societies and churches coöperate. The society maintains the Penny Provident fund; the Wayfarers' Lodge and Woodyard, which gave in 1897-98, 19,745 meals and 6,231 lodgings, and workrooms for unskilled women in Brooklyn. *The Charities* and *The Charities Directory* are published by this society.

CHARLTON, JOHN, Liberal member of the Dominion parliament for North Norfolk, Ontario, was appointed a member of the Anglo-American Joint High Commission (See CANADA) created in May, 1898. He was born near Caledonia, New York, February 3, 1829. In 1849 he accompanied his parents to Canada; engaged in trade in 1853 at Ayr, Ontario, and in 1859 became manager of a lumber business in Tonawanda, New York. Two years later he entered upon the same kind of business for himself and is still engaged in it. Mr. Charlton is well known for his advocacy of trade reciprocity between the United States and Canada.

CHAUTAUQUA ASSEMBLY, organized in 1874 by Lewis Miller and John H. Vincent, with courses of instruction in art, science, language, literature, music, etc. Its annual sessions are held in Chautauqua, N. Y. President, Lewis Miller, Akron, Ohio; secretary, W. A. Duncan, Syracuse, N. Y. The Chautauqua Literary and Scientific Circle was organized in Chautauqua in 1878 to spread the influence of the Assembly throughout the country. The course extends four years, but each year is complete in itself. The membership exceeds 250,000. General superintendent, J. L. Hurlbert, New York; secretary, Kate F. Kimball, Buffalo, N. Y. The Chautauqua School of the English Bible was organized in 1888. In 1882 a charter for Chautauqua University was granted and in 1884, the Chautauqua School of Theology received its charter. In 1898 the Collegiate Department numbered 52 instructors. The branches were: I. English language and literature; II. School of modern languages; III. School of classical languages; IV. School of mathematics and science; V. School of social science; VI. Schools of sacred literature; VII. School of pedagogy; VIII. School of music; IX. School of fine arts; X. School of expression; XI. School of physical education; and XII. School of practical arts. In addition to these there are many lectures, concerts, and entertainments, special nature study work under the auspices of the agricultural department of Cornell University, embracing entomology, ornithology and invertebrate zoology.

CHEMICAL PRECIPITATION. See SEWAGE PURIFICATION.

CHEMICAL SOCIETY, AMERICAN, was organized in 1876 "for the advancement of chemistry and the promotion of chemical research." It comprises the following local sections: Rhode Island, Cincinnati, New York, Washington, Lehigh Valley, Nebraska, Chicago, North Carolina, Columbus, and the Northeastern section. The meetings of the local sections are held weekly at various dates. President, Edward W. Morley, Adelbert College, Cleveland, Ohio; vice-presidents, the presiding officers of the local sections; secretary, Albert C. Hale, 551 Putnam avenue, Brooklyn, N. Y.

CHESS. The most important event of 1898 was the International Chess Tournament at Vienna from May 31 to July 25, at which H. M. Pillsbury tied with Dr. Tarrasch for first place, their scores being 28½. Dr. Tarrasch won in play-off of the tie by 2½ to Pillsbury's 1½. At another International Tournament, held at Cologne in August, Amos Burn won the first prize. The United States championship was won by Pillsbury on April 1 in Brooklyn against Showalter, the stakes being \$2,000. In the third international cable match between Great Britain and the United States for the Newnes Trophy, the British players won by a score of 5½ to 4½. In the inter-collegiate tournament in which Harvard, Yale, Princeton, and Columbia took part, Harvard was successful, this being the fifth successive victory won by the Harvard players.

CHICAGO ARCHITECTURAL CLUB. See SCULPTURE (paragraph Exhibitions).

CHICAGO DRAINAGE CHANNEL. See CANALS (paragraph Drainage Canals).

CHICAGO, UNIVERSITY OF, situated between Washington and Jackson parks, Chicago, Illinois, was founded in 1889 by Mr. John D. Rockefeller; instruction began in October, 1892. The institution is coeducational and denominationally is Baptist. Though less than a decade has passed since its organization the university is well equipped both in the undergraduate and in the graduate departments. There is a divinity school, and schools of law, medicine, engineering, technology, fine arts, and music will be established as soon as the funds of the university permit. Connected with the astronomical department is the Yerkes Observatory near Geneva lake, Wisconsin, about seventy-five miles from Chicago. In 1898 the library comprised about 341,740 volumes. According to the *Annual Register* for the year ending July 1898, the officers of instruction numbered 209; the number of students was: In the graduate schools, 1,113; in the colleges, 1,293; in the divinity school, 371; total, deducting repetitions, 2,307. The degrees conferred during this period were: A. B., 61; S. B., 16; Ph. B., 60; D. B., 32; Theol. B., 1; A. M., 10; S. M., 5; Ph. M., 3; Ph. D., 37. The president since the foundation of the university has been William Rainey Harper, Ph. D., D. D., LL. D. See UNIVERSITIES AND COLLEGES.

CHILDRENS' AID SOCIETY, organized in 1853, for the education of poor children and for procuring homes for them in moral districts. In 1898 it assisted 33,486 persons. It has 20 industrial schools, kindergartens, and owns property to the value of \$600,000, including the following lodging houses for boys and girls. The Brace Memorial for boys, 9 Duane street; the Elizabeth Home for Girls, 307 E. 12th st.; East Side for boys, 287 E. Broadway; West Side for boys, 201 W. 32nd st.; Forty-fourth street for boys; Tompkins Square for boys; and the Fogg for girls, 552 W. 53rd st. The income in 1898 was \$297,943; expenditures \$311,100. President, D. Willis James; secretary, Clarence L. Brace. Headquarters, United Charities building, 105 E. 22nd st., New York.

CHILE, a republic on the Pacific coast of southern South America, comprises 23 provinces and 6 territories, whose aggregate area is 293,790 square miles. This area includes the province of Antofagasta which was ceded to Chile by Bolivia in 1884, and those of Tacna and Tarapacá, ceded the same year by Peru. The cession of Tacna, including Arica, was provisional. (See concluding paragraph and the article PERU.) According to the census of 1895 the population was 2,712,145; it is likely, however, that the actual population, including 50,000 Indians, is in excess of this and in 1898 it was thought to be about 3,300,000, of whom 1,500,000 are engaged in agricultural pursuits. According to the census of 1895 there were 1,263,645 males and 1,263,675 females. The foreign inhabitants numbered 87,077, of whom about 35,000 were Peruvians. The territory Magallanes is the largest district (75,292 square miles) and has the fewest inhabitants (5,170 in 1895); the smallest province is Valparaiso (1,637), the population of which in 1895 was placed at 220,756; the most populous province is Santiago, which in the same year numbered 415,636. Santiago is the capital (pop. 256,403); other important cities are Valparaiso (122,447), Concepcion (39,839), Talca (33,232), Iquique (33,031), Chillan (28,738), Serena (15,712), Antofagasta (13,530), and Curicó (12,669).

Government.—According to the constitution, which was adopted in 1833, the chief executive authority is vested in a President, who is chosen for a term of five years by an electoral college, and who is assisted by a Council of State and a ministry consisting of the following departments: The Interior, Finance, Foreign Affairs, War and Marine, Justice and Public Instruction, Worship and Colonization, Industry and Public Works. The Council of State is composed of five members appointed by the President and six members selected by the Congress. The President has the power of veto, but, as in the United States, a two-thirds vote passes a bill over such veto; a President is not eligible for re-election. The President in 1898 was Don Federico Errázuriz, who was elected June 25, 1896. The legislative authority devolves upon a Congress of two houses, a Senate and a Chamber of Deputies, Senators being chosen for six years and deputies for three by direct vote from the provinces and departments. The proportion is one Deputy for every 30,000 inhabitants, or a fraction not less than 15,000, and one Senator for every three Deputies. Eligibility for the lower house requires an annual income of about \$500, and for the upper house an income of about \$2,000. The provinces are administered by *intendentes*, and the subdivisions, or departments, by *gobernadores*, both nominated by the President. In the departmental capitals are the courts of first instance and throughout the country there are subordinate courts; besides these there are six courts of appeal, and in Santiago the High Court of Justice.

Finance.—The revenues and expenditures of Chile in pesos, as officially stated, were as follows up to 1894; for the years succeeding the estimates are given:

	1890.	1892.	1893.
Revenue.....	59,255,783	62,400,000	73,443,000
Expenditure.....	75,063,376	60,900,000	62,692,500
	1894.	1895.	1896.
Revenue.....	83,436,000	77,354,000	91,010,000
Expenditure.....	78,482,00		86,989,658
		1897.	1898.
Revenue.....		79,200,000	76,250,000
Expenditure.....		79,155,971	76,205,164

These revenues are derived chiefly from export and import duties and from the railroads; the chief expenditures are for the national debt and for public works and salaries. The public debt in pesos, June 1897, was: External, 247,893,664, including interest amounting to 12,675,733; internal including municipal, 30,169,042.

Currency.—In 1895 the Chilean government passed a resumption act establishing the gold basis. The effect of this was to raise the value of the Chilean peso to a little over thirty-five cents in gold and to enable merchants to make their contracts with some degree of certainty and accuracy. For a time it established confidence and kept down prices, "because the merchants did not have to add to the value of his merchandise an estimate for the unknown depreciation of the money of liquidation"; yet the law did not bring about the permanent condition desired. The Hon. Henry L. Wilson, United States Minister to Chile, in his report to the State Department on August 18, 1898, expresses the belief that this act would have been entirely successful had it been fully carried out. Credits, he said, were easy because of the faith in the stability of the currency and the law at first improved substantially the condition of the industrial and commercial classes. The necessity of large expenditure on account of the increase of the military establishment caused a heavy strain on the treasury and a departure from the policy indicated by the law. In midsummer, 1898, it was reported that a financial panic had set in in Chile. In July, the Congress suspended for thirty days payment of action at law for debts, and the banks, after the passage of this act, paid to depositors only such sums as were necessary to relieve their actual wants. Then came a message from the President to Congress on July 13, recommending the issue of 50,000,000 pesos in paper for the payment of all obligations in which the government had not made a special gold contract, and a law was passed to this effect on July 30, 1898. It authorized the issue of 50,000,000 paper pesos, the peso being equivalent at that time to 36.5 cents of American money. Opposition to this policy, according to Minister Wilson's report, came generally from small tradesmen, artisans, and people of the working classes who seemed to be heartily in favor of the gold standard. Support on the other hand was given to it by the landholders for the reason, as Mr. Wilson thinks, that the act enabled them to pay their mortgages in depreciated currency. The effect of the new law was to cause the disappearance of gold from circulation, although before its passage there had been some 45,000,000 in gold in currency. Gold as a commodity went to a premium of 40 per cent. Mr. Wilson believes that the chief burden of this depreciation fell upon the small tradesmen and wage-earners, for the former could not change their business methods readily and were obliged to sell at the old prices, and the latter were paid in currency that had depreciated 30 per cent. without being compensated by a proportionate rise in wages. Debtors including of course the government benefited from the change.

Banking.—There is no state bank in Chile, but in 1897 there were 20 joint-stock banks of issue with a total capital of 50,318,829 pesos and a registered issue of 13,448,261 pesos. The government obliged the banks to guarantee this note issue by satisfactory deposits in the Treasury. There are also a number of land banks.

Army and Navy.—The peace footing, which must not exceed 9,000 men, consists of 9 regiments of infantry, 8 of cavalry, 5 of artillery, and a corps of engineers. In 1896 the national guard was reorganized and all male citizens from twenty to forty years of age are obliged to serve. About 25,000 men are trained each year, and the total force numbers about 432,000. The Chilean navy is very considerable for a South American country. It is reported to consist of: 1 first-class battleship; 1 port-defense armor-clad; 1 first-class cruiser and 1 building; 1 armored cruiser; 4 second-class cruisers; 11 third-class cruisers and 2 building; 5 first-class and 8 third-class torpedo boats; 4 torpedo destroyers building. The complement is given as 1,860 officers and men. Among these vessels are the well known small battleship *Capitan Prat*, the first-class cruiser *Esmeralda*, and the armored cruiser *O'Higgins*.

Industries.—Chile has been recognized as one of the most progressive and prosperous countries of South America. Though the country is essentially agricultural,

one and a half millions of the population being engaged in agricultural pursuits, much attention is given to the exploitation of its mineral wealth, and manufacturing interests, though not extensive, are increasing. Farm labor is directed chiefly to the cultivation of cereals and the raising of cattle, sheep, and goats, but large quantities of fruits and vegetables are also produced. The annual production of wheat is about 28,500,000 bushels of wheat and about 8,500,000 bushels of other grains, while each year there are raised 500,000 head of cattle and 2,000,000 sheep, goats, etc. The annual mineral output is reported as follows: Gold, 500 kilogrammes (1 kilogr. equals 2.2046 lbs.); silver, 160,000 kilogrammes; copper, 400,000 metric quintals (1 quintal equals 220.46 lbs.); coal, 10,000,000 metric tons (1 metric ton equals 2,204.6 lbs.); manganese and iodine are also produced. The chief mineral export is nitrate and in this Chile has practically a monopoly in the world's trade. The fields are estimated to extend over an area of about 220,350 acres, and to contain 2,316,000,000 metric quintals of nitrate. The following figures have been given for the yearly output in tons: 1884, 550,000; 1885, 420,000; 1886, 443,000; 1887, 702,000; 1888, 773,000; 1889, 903,000; 1890, 1,009,000; 1891, 877,000; 1892, 804,842; 1893, 938,871; 1894, 1,082,285; 1895, 1,220,000; 1896, 1,092,000. According to a report in the *Bulletin of the Bureau of American Republics* for September 1898, the exportation of nitrate, together with that used in Chile for 1897, was 2,344,161 metric tons. The same report states that the output continued to increase in 1898, the amount for the first quarter being 693,485 metric tons, while during the corresponding period of 1897 there was a production of only 388,532 metric tons. In this year there were but 30 nitrate factories and in 1898 there were 44. Notwithstanding the development of the industry, the financial return was not commensurate, for the prices have continued to fall since 1895. To a considerable extent this industry is controlled by English capital. About 39 per cent. of the nitrate is sent to Germany, 17.3 to France, 11.2 to Great Britain, and 10.9 to Belgium. In the department of Valparaiso, having a population of some 220,000, there were in 1895, 417 industrial establishments which during the year used raw material to the value of 20,057,573 pesos and employed 12,616 operatives, with 162 steam engines whose total horse-power was 1,766. This of course cannot be taken as indicative of the general industrial condition, for the great majority of manufactured goods consumed are imported. Among the more important factories are sugar refineries, breweries, mineral water factories, gas works, and wagon works.

Commerce.—The principal exports of Chile with the values in pesos, were in 1895: Nitrate, 45,528,000; silver, 4,918,000; copper, 4,881,000; cereals, 3,599,000; coal, 1,561,000; iodine, 1,443,000; leather, 1,022,000; gold, 248,000. The chief imports are foods, textiles, raw materials, and machinery. The following figures show the value of imports and exports, including bullion and specie, in pesos valued at about \$0.7711 United States gold:

	1893.	1894.
Imports.....	68,235,874	54,483,616
Exports.....	72,245,114	72,040,420

	1895.	1896.	1897.
Imports.....	69,206,552	74,082,805	65,502,805
Exports.....	72,919,882	74,359,414	64,754,133

It will be seen that the total value of the imports and exports for 1896 was greater than that of the following year by 18,185,281 pesos.

Shipping and Communications.—On January 1, 1896, the merchant marine consisted of 42 steamers and 146 sailing vessels, having a total tonnage of 105,642; the steam tonnage amounted to 29,931 tons net. In 1895 there entered from foreign ports 2,021 vessels of 2,732,000 tons, and cleared 1,919 vessels of 2,969,000 tons; entering vessels in the coasting trade represented a total tonnage of 6,232,000. There are English, French and German steamship lines between the Chilean ports and Europe by way of the straits of Magellan, and English and Chilean lines to Peru and Panama. The total length of railways in 1896 was 2,504 miles, of which the State owned and operated 1,057 miles, and the remainder, constituting fifteen different lines, was owned and operated by private companies. "The leading line is the Grand Central, belonging to the State, which is composed of three divisions—from Valparaiso to Santiago and thence to Melipilla, from Santiago to Talca, from San Fernando to Alcones, and from Pelequen to Peumo; from Talca to Talcahuano, San Rosendo to Traiguén, Santa Fé to Los Angeles, and Roblería to Victoria,"—a total, for the three divisions, of 766 miles. It was thought in 1898 that the 46 miles remaining unbuilt in the Transandine Railway would be speedily finished by the government. This road connecting Santa Rosa and Mendoza, 152 miles apart, will effect direct communication between Valparaiso and Buenos Ayres, 622 miles dis-

tant. The cost of the State lines at the close of 1893 was 64,459,179 pesos; the cost including 600 miles that will ultimately revert to the State was 77,540,011 pesos. At the beginning of 1896 the State telegraph lines aggregated 6,965 miles with 8,330 miles of wire and 205 offices; besides these there are over 2,600 miles of railway and private lines. In 1895 there were 617 post-offices; the postal revenue was 1,749,021 pesos, and expenditures 1,930,935 pesos.

Religion and Education.—The State religion is Roman Catholic, but all others are tolerated and respected. In 1896 subsidies amounting to 701,728 pesos were granted to the clergy for various church purposes. Civil marriage alone is recognized by law. Education is free. It is classified as "superior or professional, medium or secondary, and primary or elementary." In 1895 there were 1,248 public primary schools having 114,565 pupils; the average attendance was reported as 71,901 pupils and 2,145 teachers. For professional and secondary education there are the University and the National Institute at Santiago and various lyceums and colleges in the more important towns. In these institutions may be found departments of science, medicine, law, and fine arts, and the number of students in these departments in 1894 was 1,190; in the following year the total number of students in the National Institute and provincial colleges was 8,710. Besides normal, agricultural, and other special schools, there are in Santiago two government lyceums for girls, and ecclesiastical seminaries at the seats of the bishops. In 1895 there were 411 private schools with 18,052 pupils. There is a national library consisting of more than 88,000 volumes and 24,000 manuscripts. Besides public museums there are the National Conservatory of Music, the National Observatory, the Pedagogic Institute, the School of Arts and Trades, and the Institute for Deaf Mutes.

Events of 1898.—In April 1898, Chile and Peru came to an understanding over the long protracted dispute in regard to the provinces of Tacna and Arica. A treaty signed on October 20, 1883, had transferred these provinces from Peru to Chile for ten years, at the end of which time the people were to decide to which country they should belong. No agreement was reached as to the method of ascertaining the popular wish in 1893 nor in the five years that followed. In the latter part of April 1898 such an agreement was at length attained by the signing at that date of a treaty which determined the methods of taking the popular vote and left all disputes in regard to these and other details to the arbitration of the Queen Regent of Spain. (See PERU). On June 1, the President announced at the opening of congress that the appointment of arbitrators for the delimitation of the boundary had been agreed upon with the Argentine Republic. (For an account of the nature of this dispute and its outcome before the close of the year see the article ARGENTINA.) A new cabinet was formed early in April. An important subject of discussion in the summer was the question of the conversion of paper currency and the party opposed to conversion gained the upper hand. It was decided that \$50,000,000 of paper should be issued to be partly guaranteed by a charge on the custom houses and to be redeemed in three years and a half. The effect of this measure upon trade is described in a preceding paragraph. Gold at once went to a high premium. The confusion in the finances seriously hampered the government in its preparations for a possible war. On October 19, a ministerial crisis began and lasted until December 20, when a new cabinet was formed.

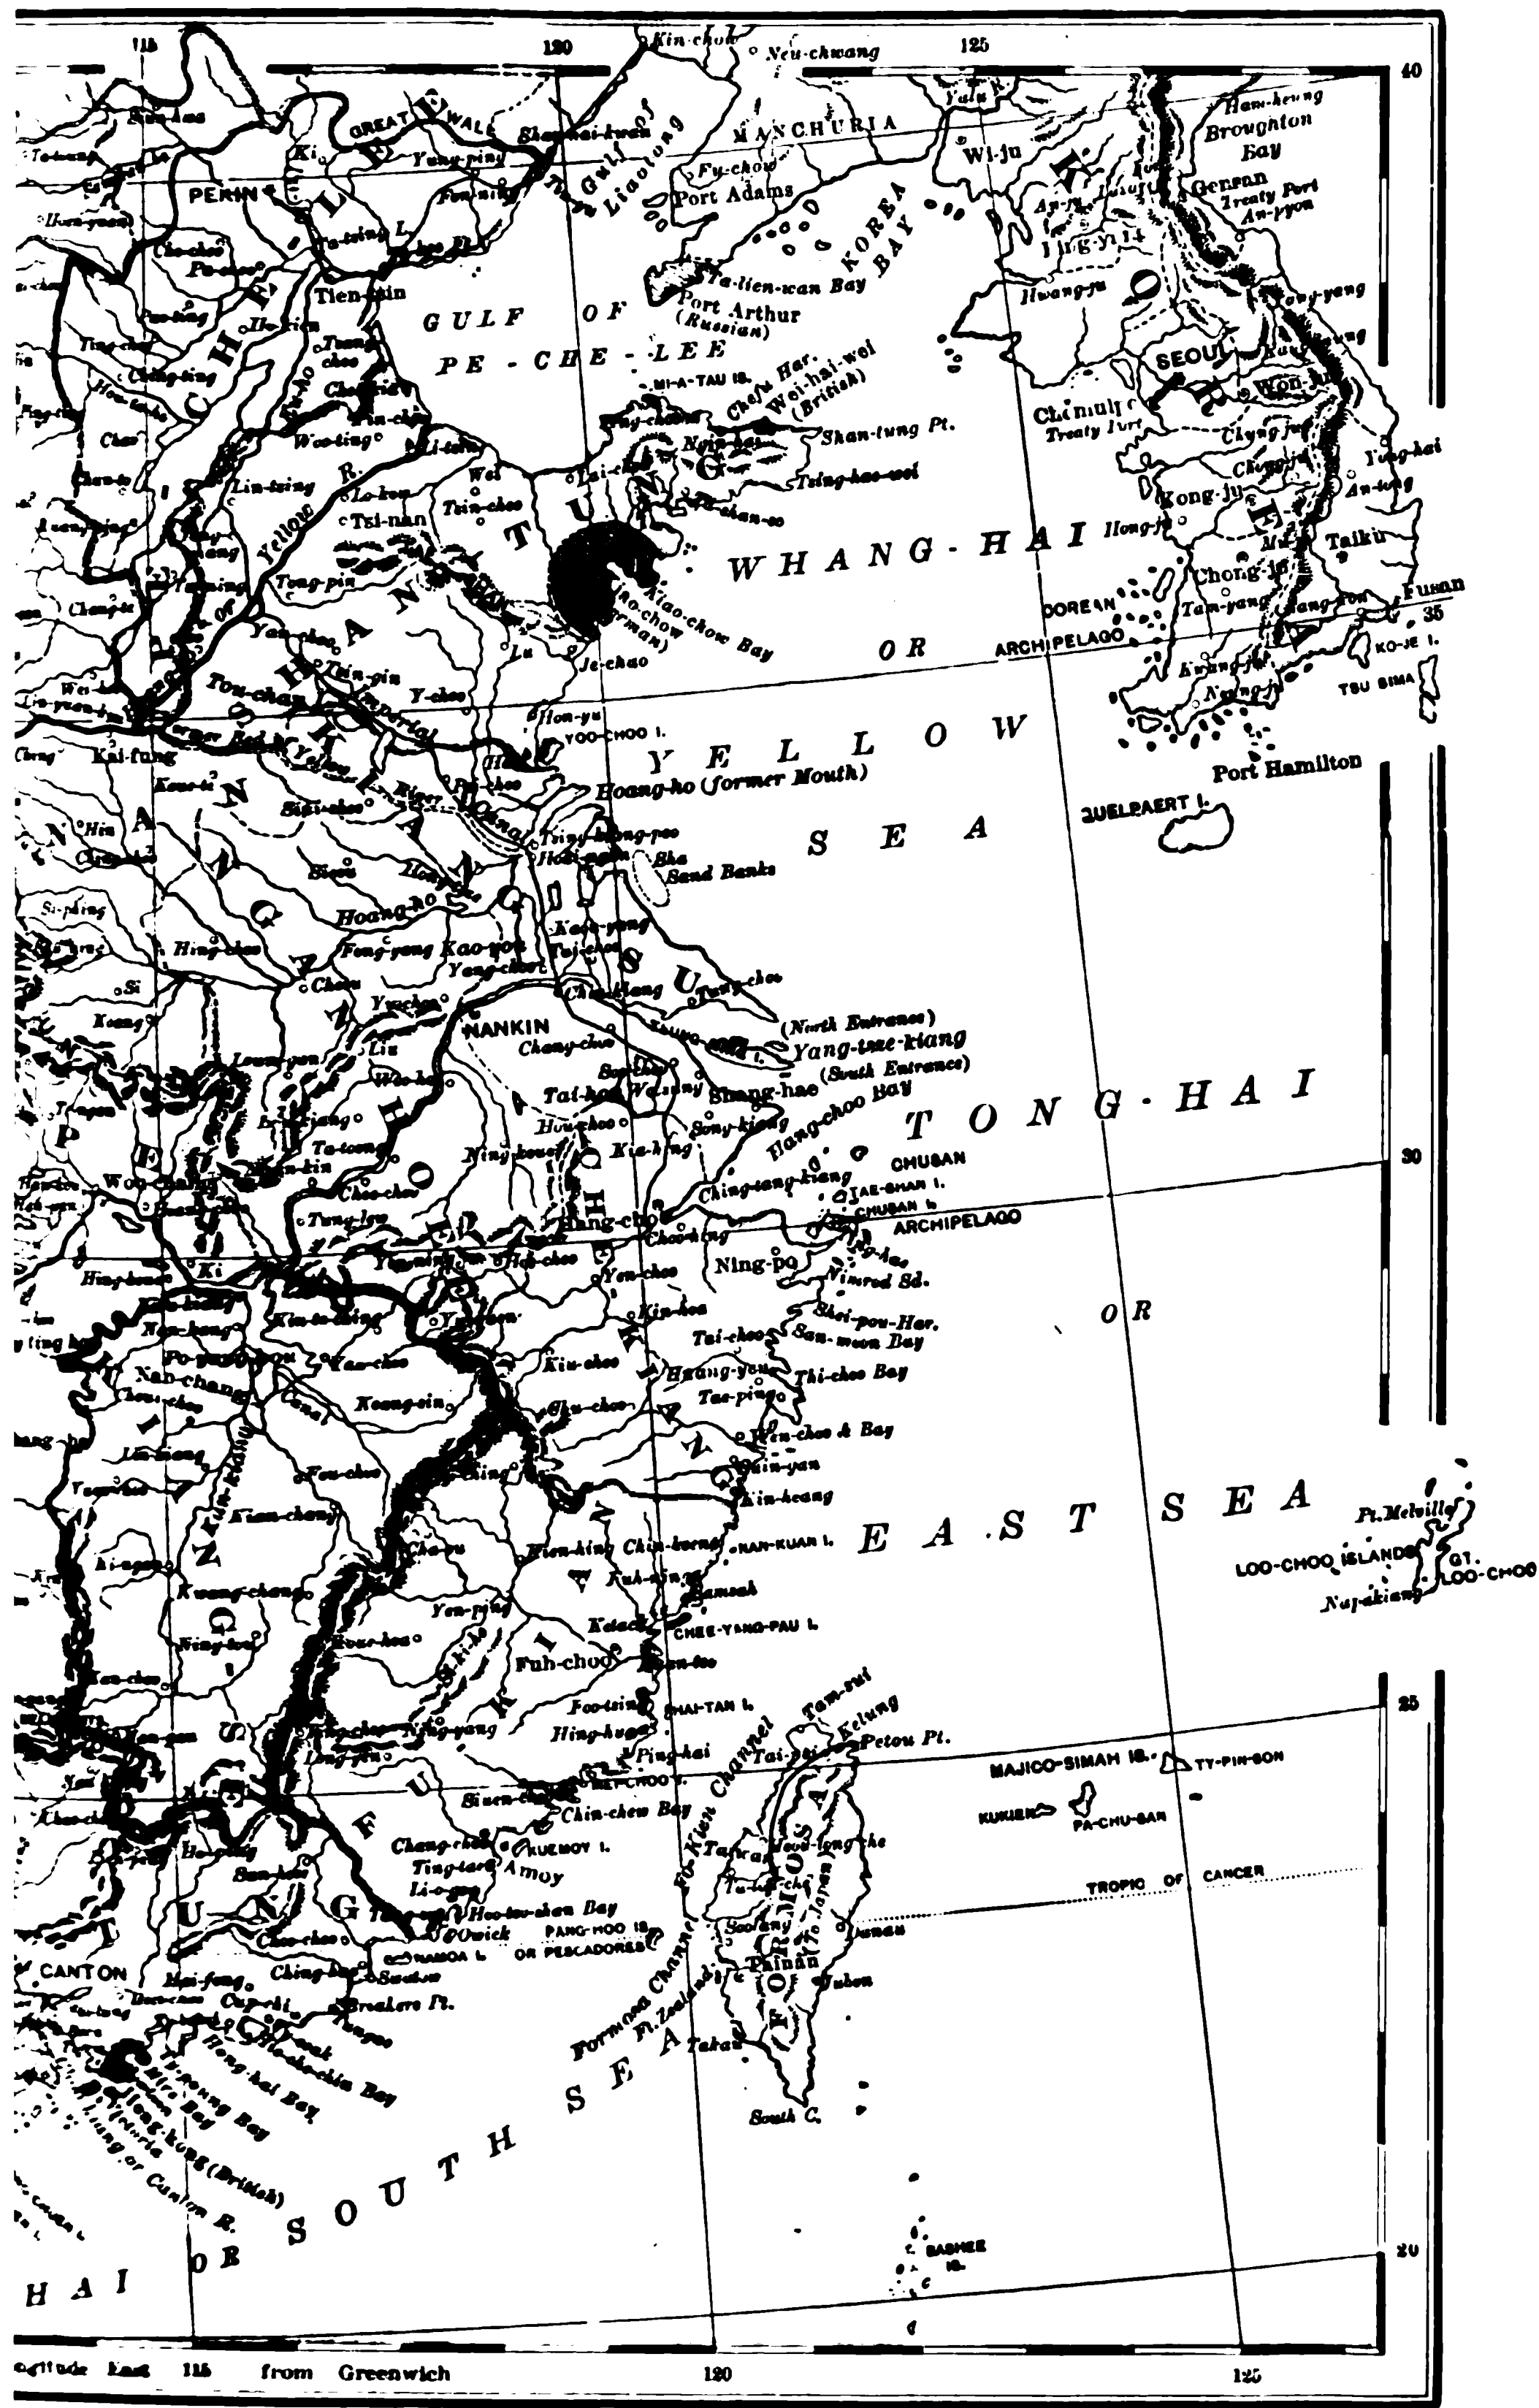

CHINESE EMPIRE, a vast territory in eastern Asia comprising China proper and the dependencies of Manchuria, Mongolia, Thibet, Jungaria and Eastern Turkestan. China proper, according to the latest estimates available in 1898, has an area of 1,336,841 sq. m. with a population of 386,000,000, and including the dependencies the area was 4,218,401 sq. m. with a population of 402,680,000.

Production and Industry.—Agriculture is the leading occupation and in general the land is divided into small holdings. In the north the principal crops are wheat, barley, maize, millet and other cereals together with peas and beans, and in the south, rice, sugar, indigo and cotton. The cultivation of tea and silk is of special importance, the former prevailing in the southern and western provinces and the latter being carried on with the best results in the provinces of Keang-su, Sze-chuen, Che-keang, Kwang-tung. Coal is said to appear in each of the eighteen provinces, especially in Shan-si and Honan, and China is reputed to have the richest supply of this mineral in the world. There is also a considerable amount of copper and iron.

The mineral contents of the Shantung peninsula, which has been acquired by Germany, are of great value. The coal measure formations are abundantly developed in the western peninsula, and form the most important mineral resource of that region not only on account of their abundance, but also for the reason, it is claimed, that in all southern and eastern Asia, there is no place where equally good coal is found so near to a shipping point. The presence of iron ores of good quality is also noted but they have not been worked. See GEOLOGY, COAL, and IRON.

The productive resources of China are, however, as yet but partially developed. Several important steps were taken in the year 1898 toward opening up the interior

to foreign enterprise, and an account of some of the concessions made by the government to foreigners will be found in succeeding paragraphs. Chinese industries develop but slowly. The principal manufactures are silk, cotton, linen and pottery. Of late years silk and cotton mills have been established in several parts of the empire. See COTTON AND COTTON INDUSTRIES.

Commerce.—In recent years the chief sharers in the foreign trade of China have been Great Britain and her colonies, the United States and Japan. In 1896 the value of the foreign trade of China in haikwan taels was, imports 202,589,994 and exports 131,081,421, the haikwan tael being equivalent to 82 cents in United States money on July 1, of that year. By far the greater part of the Chinese foreign trade was with Great Britain and Hong Kong. The principal exports were, in the order of their importance, silk, raw and manufactured, and tea, and the principal imports were cotton goods and opium. In this year the foreign trade of China was larger than ever before recorded; but in spite of certain disadvantages, such as the political disturbances and the injury to the import business caused by falling exchange, the returns for the year 1897 showed an improvement. In the United States Consular Reports for July 1898, there is a comparison between the foreign trade of China in 1897 with that of the preceding year. In 1896 the foreign trade was valued at \$270,633,000, and in 1897 at \$271,200,605. In the returns for imports for 1897 it appears that opium plays a less important part than in 1896. While it represented over 27 per cent. in 1896, it represented less than 14 per cent. in 1897. The trade in cotton goods showed a falling off as compared with the figures of 1896, although American cotton goods continued in demand and even showed some improvement. The export trade increased steadily and in this increase nearly every item shared during the year. The shipping for 1897 also increased, the number of entries showing 5,281 vessels as against 4,722 in the previous year. Of the total tonnage Great Britain had 65 per cent., China, 23 per cent., Germany 5 per cent., Japan, 2 per cent., Norway and Sweden 2 per cent., France 1 per cent., United States, 1 per cent., and all other countries 1 per cent. The direct imports from the United States in 1897 amounted to \$9,202,713, and the exports to the United States to \$13,181,563, reversing the relation of the previous year, when the direct imports exceeded in value the direct exports. In the year ending June 30, 1898, the exports to the United States were \$20,326,388, and the imports from the United States \$9,992,894. But returns in regard to the imports are not conclusive as to the actual amount of American goods consumed in China, since the carrying trade is largely in the hands of other nations and American goods are often set down as coming from the country in whose vessels they are imported.

Trade with the United States.—It was said that the American trade with China in 1897 was showing better prospects. More competent agents were chosen to represent the American manufacturers and there was a considerable importation from the United States of locomotives and machinery for mining plants. It was said, for example, that in the port of Chefoo in 1897 the imports from the United States were four times as large as those for 1893, with the single exception of oil, which however, had more than doubled; and during the first six months of 1898 this condition apparently continued. In the United States Consular Reports for August 1898, there is an instructive table presented showing the distribution of the Chinese foreign trade in 1897. From this it appears that the trade with the United States almost equaled the trade with the entire continent of Europe with the exception of Russia. The trade with Great Britain was \$39,138,943, and with the British dependency of Hong Kong \$111,240,273. Japan stood next and then came the United States with \$22,358,854. These figures when compared with the figures of 1890 show, that while the exports from Great Britain did not quite double in eight years, the exports from the United States trebled; and that the exports from China to Great Britain decreased, while those to the United States more than doubled. The American shipping also had increased, but even in 1897 American ships and tonnage stood seventh on the list. The activity of the German merchants in China has often been remarked. In 1897-'98 they continued as formerly very formidable rivals of the Americans. In Hankow the imports of the German trade showed a rapid increase in 1897-98 and with the exception of the tea trade, which was in the hands of the Russians and English, it was reported that almost all of the exports were controlled by the Germans. Considering that the German trade with Hankow is only 14 years old and that the English until recently have almost wholly controlled the shipping interests, the advance of German commerce is remarkable. The German merchants are cited by our consuls as affording most instructive examples of industry, energy and attention to business. Nevertheless, the United States, according to the latest reports available in 1898, continued to hold the second place to Great Britain among western nations in the importance of her trade with China, and in some regions, as for instance that of which Chefoo is the treaty port, the American commercial interests surpass those of any other nation. There is a chance for the expansion of American trade through the new policy of the Chinese government in granting railway concessions, as illus-

trated in a succeeding paragraph, and already there has been a considerable demand for steel rails, machinery and rolling stock. As a purchaser of Chinese goods the United States holds an important position. Of some commodities she is the largest purchaser, as for instance in the case of fire-crackers, of which the greatest part of the exports from China were sent in 1897 by sailing vessels to New York. The fact that the importation of American goods appears to be so rapidly on the increase is attributed in part to the cheapness of these goods, freights from America being lower than from Europe. The items in which the increase of imports from the United States is most marked are drills, sheeting and kerosene oil.

Treaty Ports.—One of the signs of the progressive spirit which has shown itself recently in the reign of the Emperor Kwang-su, is the opening of new treaty ports. Early in 1898 the United States Minister to China reported that the Emperor had opened the following places as treaty ports: Yo-Chou in the province of Hunan; San-tu-ao in the province of Fukien; and Chin-wang-tao in the province of Chihli. Yo-Chou is the first place opened to foreign trade in the province of Hunan. It is the centre of considerable trade in native produce and it is hoped that a large carrying trade will be developed when foreign steamers begin to run there. These three ports were opened by the imperial decree of March 31, 1898. A few weeks later the port of Woosung was also opened. In a report dated April 20, 1898, the United States Minister to China gave the following list of open ports together with the names of the treaties, the dates at which they were thrown open and the population of each place:

List of treaty ports and ports of call.			
Port.	Year.	Pop.	
Treaty of Nankin with Great Britain, August 29, 1842.			
Canton	1859	2,500,000	
Amoy	1862	96,000	
Fuchau.. ..	1861	650,000	
Ningpo	1860	255,000	
Shanghai	1854	475,000	
Treaty of Tientsin with Great Britain, July 26, 1858.			
Niuchwang	1861	60,000	
Chefoo	1861	35,000	
Swatow	1860	35,000	
Kiungchau	1876	40,000	
Not especially named in the treaty, but afterwards designated.			
Hankau	1862	800,000	
Chinkiang	1861	140,000	
Kiukiang	1862	55,000	
Pekin convention with Great Britain, October 24, 1860.			
Tientsin	1861	950,000	
Treaty between France and China, October 25, 1860.			
Nankin	Unknown	
Treaty with Russia, November 2, 1860.			
Kashgar	Unknown	
Chefoo convention with Great Britain, September 13, 1876.			
Ichang	1877	34,000	
Wuhu	1877	79,700	
Wenchow	1877	80,000	
Pakhoi	1877	20,000	
Treaty with France, June 26, 1887.			
Lungchow	1888	22,000	
Mengtsz	1888	12,000	
Manhao	Unknown	
Additional articles to the Chefoo convention with Great Britain, March 31, 1890.			
Chungking	1890	300,000	
Regulations appended to Sikkem-Thibet convention of 1890 with Great Britain, December 5, 1893.			
Yatung	1894	Unknown	

Port.	Year.	Pop.
Convention with Great Britain, March 1, 1894.		
Manwyne	Unknown
Treaty with Japan, Shimoneseki, April 17, 1895.		
Shashih	1896	73,000
Chungking		
Suchow	1896	500,000
Hangchow	1896	700,000
Gerard supplementary convention with France, June 20, 1895.		
Szema	1896	15,000
Under special article of treaty with Great Britain, February 4, 1897 (both on West river).		
Samshui	1897	4,000
Wuchow	1897	50,000
Opened by an imperial decree of March 31, 1898.		
Yo-chou	Unknown
Santua	Unknown
Chinwangtao	Unknown
Opened by imperial decree, April 7, 1898.		
Woosung	Unknown

Internal Navigation.—Besides the establishment of new treaty ports, another sign of progress in China was the opening of the inland waters to foreign commerce. In China the canals take the place of railways in other lands as a means of transit for internal trade. Throwing them open to foreigners removed one of the greatest obstacles to internal development. It was announced in February 1898, that the Chinese government had consented to admit foreign and native steamers to the inland navigable waters, and in the summer of that year the government issued the regulations which should govern the inland steam navigation. After stating that the inland waters of the treaty port provinces were open to small steamers, native or foreign, plying to treaty ports, the government laid down rules in regard to registration, revenue and the jurisdiction of the courts.

Education.—In the year 1898 there were also signs of progress in educational matters and it was expected that educational reforms of the greatest importance would be introduced. The Emperor issued a decree sanctioning the opening of a national university at Peking, and at the same time provided for the establishment of schools in the capitals of the provinces and in the department and district cities. It was expected that the curriculum at the University of Peking would be similar to that of the Japanese university and therefore pave the way toward a more progressive educational system. The cause of reform received a check in September when the Dowager Empress regained her control of the government and rescinded the reform decrees, but before the close of the year it appeared that she too was inclining toward progressive measures. While education is general among certain classes, there are large numbers of adults who cannot read or write, and even among the literati education is of a far too formal and unpractical character. Very crude notions prevail in regard to the natural sciences, but in recent years translations of western works of science have increased. There is a college of foreign knowledge at Peking with instruction in foreign languages, and elementary science is taught in the numerous mission schools at the various ports.

Finance.—The government does not publish the exact statistics of finance and the only available figures are those which are based upon estimates. The principal sources of revenue are the land tax, the customs duties, the salt duty and the *likin* on merchandise, and the chief branches of expenditure are the administration of the provinces, including the military establishments, the metropolitan administration, Manchu garrisons and imperial household. The collection of the duties on foreign goods is managed by the imperial customs department, the head of which is an Englishman, and a number of Europeans and Americans are employed as subordinates.

Army and Navy.—In 1898 some proposals were made for the improvement of the Chinese army, but no definite information as to what had been done could be procured, and it is probable that but slight changes had been made since the close of the war with Japan. Hitherto the best troops have been the Black Flags, who are said to number 50,000, and to be trained and equipped somewhat in the manner of European troops. A still larger force is the Eight Banner men, estimated at 300,000, and

the army of Manchuria, estimated at 180,000. Of these only a part were trained and equipped after European models. Besides these bodies are the Green Flags, with a nominal strength of 650,000. They are under the control of the local governors and have not been considered a particularly effective force. Their strength on a war footing is placed at 200,000. There is also a contingent force, the Tientsin Army Corps, with a paper strength of 100,000 of which perhaps 35,000 are effective. The nominal peace strength of the entire army is placed at 300,000, and its war strength at 1,000,000.

The great losses inflicted upon the Chinese navy by the war with Japan have not yet been repaired, although a few additions have been made to the fleet, including one torpedo cruiser, two protected cruisers, and several torpedo boats.

Government.—The head of the State is the Emperor by whom the supreme direction of affairs is entrusted to a Privy Council. Under the direction of the privy council the Nei-ko, or cabinet, controls the administration. The latter body is composed of four members, or ministers of state who control seven government boards; namely, the Board of Civil Appointments, of Revenues, of Rites and Ceremonies; of Military; of Public Works; of Admiralty; and the High Tribunal of Criminal Jurisdiction. There is also a Board of Censors, or Supervisors, which is in theory above the central administration. One of its members, of whom there are from 40 to 50, is to be present at the meeting of each board, and all have the right of remonstrating to the sovereign in regard to acts of administration. The Tsung-li-Yamen, or foreign office, has charge of foreign affairs and those branches of the administration in which foreigners are employed, as in the Maritime Customs, Peking University, etc. As to the local administration each province has a Governor, or Vice-Governor, who is responsible to the Emperor and is assisted by a council and other officials. Each province is divided into departments, and each department into districts.

HISTORY, 1898.

The Germans at Kiao-Chau.—In the autumn of 1897, there took place an event which looked like the first step in the partition of China. The murder of two German missionaries in the province of Shan-Tung led to a demand for reparation. The delay of the Chinese government in giving satisfaction prompted the German government to vigorous action. A naval force was sent to the port of Kiao-Chau on the western coast of the Yellow sea, and a body of marines about six hundred strong was landed there on November 15th, 1897. The Chinese garrison, though greatly superior in numbers, fled without offering resistance, and the Germans hoisted their flag over the fort. The other European powers made no protest against this action, but there was a general feeling of uneasiness in regard to Germany's intentions. It was thought that the murder of the missionaries was taken merely as an excuse for the seizure of Chinese territories,—that Germany had determined to have her share in the Celestial Empire, as an offset to the expected encroachments of Russia by way of Manchuria, and France by way of Tonquin. Negotiations followed between the German and Chinese governments, and in December 1897, a small German squadron was ordered to start for Chinese waters. Before the embarkation an imposing ceremony was had at which, in the presence of the chief officers of the State, the army and the navy, the Emperor made an address, encouraging those who took part in the expedition, and upholding the purpose for which it was undertaken. Prince Henry was placed in command, and the Emperor in the course of his speech dwelt on the great sacrifice he was making in sending his only brother to maintain the interests of Germany in those distant seas. The somewhat melodramatic character of the Emperor's speech provoked the ridicule of the press in other countries, for the expedition did not seem likely to be of an especially hazardous nature, and the fleet was not of an imposing size or character. Nevertheless, it was evident that Germany had embarked on a new and significant policy in regard to the far East. On Jan. 5, 1898, it was announced that the demands of Germany had been granted by the Chinese government. These concessions included a 99-year lease of the bay of Kiao-Chau together with the cession of a considerable tract of the surrounding land, as well as important commercial and industrial privileges in the adjacent territory. Like France in Tonquin, Great Britain in Hong Kong, and Russia in Manchuria, Germany was bound to secure for herself a naval base for the protection of her commerce in the East.

The Russians at Port Arthur.—Almost at the same time that Prince Henry was setting out on his pompously announced expedition, it was reported that Russia was making a move in the same game. It was rumored that a Russian fleet had occupied Port Arthur, at the mouth of the Gulf of Pechili, a point which is capable of being made the strongest fortress on the Chinese coast. Japan had seized this station at the close of the war with China, but had given it up under pressure from the three great powers, Russia, Germany and France. On March 28 it was announced

that Port Arthur and the neighboring city of Talien-wan, with its adjoining territory was ceded to Russia in usufruct for twenty-five years, with the privilege of extension. Russia also acquired the right of connecting these points with the main line of the Trans-Siberian railway. On the other hand she agreed to open a part of the harbor of Talien-wan to the merchant vessels of other nations, establishing there a customs tariff as in the treaty ports, but administered by Russian officials.

Concessions to the British.—At the close of the war between Japan and China, Russia and France guaranteed the Chinese loan for the war indemnity to Japan with the probable object of securing a sort of mortgage on parts of the Chinese Empire, which in the case of failure to pay the loan might be foreclosed with advantage. A portion of the war indemnity had already been paid off. Great Britain now offered to China a loan of £12,000,000 for the payment of the balance; but, though these terms were favorable, the Chinese government hesitated to accept them, influenced, it was said, by France and Russia. A purely British loan was not accepted, but early in March it was reported that a loan of £16,000,000 had been negotiated with the Hong Kong and Shanghai Bank (a British institution) and the German-Asiatic Bank. In the meanwhile Great Britain had demanded the opening of Talien-wan and two other places as treaty ports and the guarantee that no portion of the Yangtse-Kiang valley should be alienated to another power. Russia opposed the opening of Talien-wan, and, upon the representation of the Chinese government that insistence upon this point would involve it in serious difficulties, this demand was withdrawn.

But after the negotiation of the Anglo-German loan, it was announced that the following concessions to the British government had been made: The valley of the Yangtse-Kiang should not be ceded or leased to any foreign power; an Englishman should direct the administration of Chinese maritime customs as before; inland waters in China should be open to the ships of foreign nations; Great Britain to secure three new trading ports, Tu-ning, Chi-wang, and Fo-chan. When Russia was taking steps to secure Port Arthur it was understood that the British government would demand the island of Wei-Hai-Wei on the opposite coast of the Gulf of Pechili if Russia carried out her plan. After the cession of Port Arthur to Russia, Great Britain demanded Wei-Hai-Wei and the demand was granted, the convention ceding it being signed on July 1, 1898. Another important cession to Great Britain was the granting to her of a lease for ninety-nine years of the district surrounding Mirs bay in the neighborhood of Hong Kong. By this she gained a territory covering two hundred square miles and acquired control of the heights commanding Hong Kong, thus making that colony more secure against attack from the mainland of China.

Concessions to the French.—France also took part in the scramble for Chinese territory, and, in response to her demands the Chinese government, early in April, ceded to France a bay on the southern coast of China, permitted her to establish a railway line uniting Tonquin and Yun-nan-fou, guaranteed the non-alienation of Hai-nan and of the territory adjacent to Tonquin, and provided that a Frenchman should be appointed director of the imperial post.

British Criticism of the Government's Chinese Policy.—It is much too early to form an impartial estimate of Great Britain's policy in China, but some account of the discussion to which it gave rise is important as showing the popular attitude toward the matter. The news of a Russian occupation of Port Arthur at once caused great consternation in England, where there was a strong feeling that the traditional policy of the English required the maintenance of the entirety of the Chinese Empire. It was held that the interests of British trade would be seriously injured by the partition of China. Under the leadership of Sir Ashmead-Bartlett, the House of Commons voted that British interests required the maintenance of the integrity of China. It seemed to many that a combination against Great Britain had been made by the other powers for the purpose of injuring her interests in the East, and the reports of French and Russian intrigues to prevent the Chinese government from accepting the British loan strengthened this feeling. In spite of the substantial concessions made to Great Britain, many continued to criticise the government for what they considered its retrograde policy. They thought that with Great Britain's superior naval power, Russia's seizure of Port Arthur and Talien-Wan should have been prevented by an armed demonstration. They held that Russia had outwitted the British government and that her encroachment in this instance was but the initial step in a movement which would end in her absorption of the greater part of the Chinese Empire. For more than forty years, it was urged, the motive of the British policy had been the maintenance of the entirety and independence of the Chinese nation, with the ultimate aim of opening the trade of China to foreign nations on equal terms, and if this principle had not been expressly declared until recently, it was merely because it had not been called in question by other European powers. The rapid extension of British trade with China during the last twenty years had made this policy more than ever necessary, for it was seen

that foreign countries were constantly striving for exclusive markets, and trade on equal terms was not to be expected in their colonial acquisitions. It was in view of this aspect of the matter that a member of the government, Sir Michael Hicks-Beach, had said that Great Britain "did not regard China as a place for conquest or acquisition by any European power," that the country henceforth must be open to foreign trade and that the ministry was absolutely determined "even at the cost of war, that that door should not be shut."

In permitting the cession of Kiao-Chau and Port Arthur, it was said that the government had completely backed down. For a generation British statesmen had steadily opposed the designs of Russia on the Chinese coast and now she had been permitted to occupy Port Arthur, which has been called the "Gibraltar of the Far East." As an offset to this, the government cited a cession to Great Britain of Wei-Hai-Wei and other advantages, but of these things the opposition made light. As to the alleged inviolability of the Yang-tse valley, no importance whatever was attached to the statement of the Chinese government which was supposed to imply this. That government, it was said, merely declared that it could not contemplate the alienation of its territory to any foreign power. It had not given any formal guarantee in regard to it. And, although the British government referred to the promise of Germany and Russia that their acquisitions should be open to foreign trade, it was not believed that these countries would permanently pursue that policy. Thus the government had given up its old aim of maintaining the integrity of China, and the new policy of the "open door" would eventually share the same fate, for the predatory powers were protectionists in their colonial policy, and would inevitably shut the door when once they were securely in possession.

The British Government's Defense.—In answer to these objections it was urged that British interests were not in any way jeopardized by Russia's action. British dominion in the East was already wide enough. All that concerned her was to maintain her treaty rights and trading privileges. These were not violated by the concession to Russia, for the latter power expressly disclaimed any intention of hampering trade in the ceded districts. Her object in acquiring these districts was to obtain an outlet for the great Trans-Siberian railway, a project which when completed would greatly promote the trade of China with foreign countries. The attitude of the government had been warlike at first, but it soon took its stand on the principle that while it would not brook any aggressions likely to injure Great Britain's commercial interests, it had no objection to the mere fact of the acquisition of Chinese territory by other powers.

The discussion of the far eastern question in Great Britain covered a wide range, and included a great variety of projects for strengthening the British power in China. To some the partition of the Chinese Empire seemed inevitable, while others sharply criticised the government for its alleged vacillation and weakness in dealing with the matter. Among the plans suggested for adding to British influence in China was that proposed by Mr. Archibald R. Colquhoun in *China in Transformation*, 1898. His idea was that the land base in Burmah should be connected with the sea base in Hong Kong partly by railway, and partly by the navigation of the Yang-tse. He also believed that England must acquiesce in the partition of China and the principle of spheres of influence, but must see to it that her share of the divided empire should be the rich and populous valley of the Yang-tse.

Rival Railway Schemes.—The summer of 1898 was a period of strenuous diplomacy on the part of the representatives of the powers in China in connection with mining and railway concessions. The most important disputes had to do with the proposed railway to Niu-chwang and the Peking-Hankow or Lu-han railway. As to the former it was proposed that the Hong Kong and Shanghai Bank should issue a loan to the Chinese government for extending to Niu-chwang the already completed line that runs from Peking to Shan-hai-kwan by way of Tientsin. Russia opposed this on the ground that the road ran through the territory included within her sphere of influence. The Peking-Hankow project, though nominally under the control of the Belgians, was said to be really a Russian affair, and Great Britain objected to it on similar grounds to those taken by Russia in the case of the other road, viz.: that it passed through the Yang-tse region. The reports as to the negotiations are obscure but it would seem that the British felt that the ratification of the Peking-Hankow contract would bring Russia's influence into the Yang-tse valley, and since Russia was unwilling to see the British influence extend into the provinces bordering on her own frontier as would happen if the Niu-chwang line were negotiated, the British government felt justified in opposing the Peking-Hankow agreement. At one time it seemed as if war might result from this complication. The growing influence of Russia was said to be due to the friendship of Li Hung Chang and the latter was dismissed from office. This was taken as a sign of British ascendancy, but a palace revolution occurred soon afterwards and through the in-

fluence of the Dowager Empress, Li Hung Chang was restored. Nevertheless the firm tone taken by the British government resulted in a concession in regard to the extension of the line to Niu-chwang, although on certain conditions proposed by Russia. This partial triumph of British diplomacy was offset by the failure to prevent the carrying out of the Pekin-Hankow project. It will appear from this that progress was made toward the delimitation of spheres of influence in China. One of the characteristics of the struggle was the apparent coöperation from the first of Russians, French and Belgians, and the later tendency on the part of Great Britain, Italians and Germans to draw together. As a further sign that the idea of spheres of influence controlled the action of the powers in China it may be noted that the Germans prevented the concession to a Chinaman of a railway to Tientsin and Ching-Kiang on the ground that it was within the province of Shantung and that Germany should have the first right to build any line in that province. Later Germany and Great Britain formed an agreement in regard to this line by which that portion of it which was under German influence should be controlled by German officials while the portion within the Yang-tse region should be under British administration. Again, France opposed the building of a line from Canton to Kaulung, also urging the sphere of influence argument. Thus each of the great powers seemed to admit the principle of exclusive spheres of influence.

Lord Beresford in China.—Much was said in the press in regard to the mission of Lord Charles Beresford to China. He was sent out in August by the British Associated Chambers of Commerce and ostensibly his mission had no connection with the government and its chief objects were to inquire into the industrial and commercial condition of China with a view to promoting Anglo-Chinese trade. He, it will be remembered, was the naval officer who distinguished himself at the bombardment of Alexandria. From the fact that so energetic a man and one so well versed in military and naval affairs was chosen, it was thought by many that his mission had some connection with the government and had other ends than the development of Chinese trade. Nothing occurred within the year however to confirm this view. In his published interviews and speeches, he referred to the necessity of a firm and progressive policy in China including the reorganization of the Chinese army after European models, and declared that there should be an alliance of the great powers, Great Britain, Germany, the United States and Japan, to maintain the integrity of the Chinese Empire and the policy of the "open door."

The United States and the Eastern Problem.—It was to the interest of the United States that the rights guaranteed by treaties with China should be maintained. In general the attitude of this country was that it mattered not what powers gained Chinese territory so long as American rights were respected. The policy of the "open door" as supported by Great Britain was of course favored by the United States, but it was thought to be no concern of the latter to support the former power in warning off trespassers on Chinese lands. But the new interests in the East secured to the United States as the result of the war with Spain led many to call for a more active policy in regard to this matter, and it was urged in some quarters that the United States should range herself definitely on the side of Great Britain. (See the article of the UNITED STATES, paragraphs on History.) British writers and statesmen especially emphasized the good results of such a course, both to the United States and to Great Britain.

Continental Discussion of the Chinese Problem.—To Continental observers the issue of the Spanish-American war and the movement for an Anglo-American alliance seemed to have a very definite bearing on the eastern question. In fact the existence of that eastern question afforded, in the opinion of some, a just ground for the interference of Continental Europe to prevent the acquisition of the Philippines by the United States. A French writer pointing out that the Philippines commanded the sea route from Asiatic Russia, China and Japan, declared it was a matter of vital interest to Russia, Germany and France what became of them. He asked whether these three powers could permit the United States and England to put the keys of the Far East in their pockets on the false pretext of keeping open the door of Chinese commerce. As to the attitude of Great Britain in Chinese affairs, it seemed to Continental critics both weak and vacillating. They dwelt on the inconsistency of the British government in declaring itself at one time in favor of the integrity of China and then deliberately forcing China to cede Wei-Hai-Wei and the territory adjacent to Hong Kong. They pointed to that government's attitude in the Niu-chwang railway affair as a further sign of weakness. On account of the growing friendliness between the United States and Great Britain the reports published in our newspapers have generally reflected the more favorable views of the foreign powers on the subject. French comment has on the whole been anything but favorable. It abounds in criticisms and sneers—criticisms of the futility of the means which Great Britain has employed to secure her ends, and sneers at the spirit of selfishness which seemed to these writers to direct her whole policy. French sympathy was naturally

with Russia. French writers made light of Lord Salisbury's declaration to the House of Lords on the first of August that Sir Claude Macdonald, the British minister to Peking, had been authorized some days before to say to the Chinese government, that if any foreign power should attack China she could count on the material aid of Great Britain, to which statement the Peking government replied, with thanks to Lord Salisbury, that no foreign power was attacking it. Much unfavorable comment was occasioned by a speech of Mr. Chamberlain's in which, referring to the diplomatic contest with Russia in China, he applied to the case the proverb that a man needs a long spoon who supps with the devil. The chagrin which Li Hung Chang's return to power seemed to cause those British writers who a short time before had hailed his dismissal as a diplomatic triumph for their country, gave a somewhat malicious pleasure to the French. The return of Li Hung Chang was generally viewed as marking the success of the Russian diplomacy. To the countries on the continent Russia seemed to have the best chance of securing a preponderant influence in China, for, it was said, Great Britain's vast naval power would not avail her against China. As to operations on land Russia had a decided advantage from her situation. With a numerous army on the frontier ready to march to Peking and with railroads already nearly completed, making the mobilization of troops an easy matter, Russia in case of war would have everything in her favor. Yet war did not on the whole seem imminent. Some arrangements for the dismemberment of the Chinese empire appeared more probable. If England were defeated in her diplomatic conflict at Peking, it was thought that she would avail herself of the elements of disorder and the hatred of the existing dynasty which had made their appearance in the Yang-tse valley. It would be easy for her to take advantage of the disaffection of the population in this vast and fertile region to stir up revolt against the dynasty and would be easier still if the reported plots of the Dowager Empress proved true.

Court Intrigues.—In August and the first part of September events seemed to indicate the determination of the British government to regain its influence in China and to offset that of Russia. Toward the close of September it was rumored that a palace revolution or *coup d'état* had taken place, with the probable result of reversing the progressive policy that had recently characterized the Chinese government. It appeared that the Emperor Kwang-su, had surrendered the reins of government to the Dowager Empress. This was followed in rapid succession by reports that he was physically unable to discharge the duties of his office, then that his health was failing rapidly and still later that he had committed suicide. The report of his death proved afterwards to be untrue but it gave rise at the time to the suspicion that the Dowager Empress had caused his removal by foul means, and her career was widely discussed in the press, where she was compared to Catherine de Medici and Lucretia Borgia from the rapid and successful way in which she had cleared from her path all rivals to her ambition. She was one of the secondary wives of the Emperor Hien-Fung, who died in 1861. During the minority of his successor all power was in the hands of the late Emperor's principal widow and herself, and when the young Emperor in 1874 began to show an inclination to be something more than a king in name, he failed completely in the attempt to assert his authority and died soon afterwards under suspicious circumstances. The imperial throne was again filled by a minor and after 1881 when the then Dowager Empress met her death also under suspicious circumstances, the present Dowager Empress became the sole ruler. Even after the majority of the young Emperor Kwang-su in 1889, it is said that her influence continued to direct the court. Li Hung Chang, whose sympathies were wholly with Russia and whose policy was in general retrogressive, was the chief minister of the Dowager Empress. On the other hand the Emperor was inclined to introduce reforms and profit by the example of western civilization. His adviser was the reformer Kang-Yu-Wei, to whose influence is said to be due the more open-minded attitude of the Chinese towards foreign trade and internal improvements. Early in the autumn it became known that Li Hung Chang had been reinstated and that the progressive minister, Kang-Yu-Wei, had been discharged. The secrecy surrounding the doings of the Chinese court made it impossible to obtain any authentic account of these matters. It was evident, however, that a reactionary spirit now controlled the government. The Emperor publicly announced that the direction of affairs would be entrusted to the Dowager Empress and some of the reforms which he had started were checked. Nevertheless, before the close of the year there were signs that the Empress Dowager herself was inclining toward the more progressive policy, having found perhaps that the pressure compelling her in this direction was too strong to be resisted.

The Yang-tse Region.—The Yang-tse valley comprises the six provinces of Szechuen, Hupeh, Hunan, Kiangsi, Anhui and Kiang-Su, with a population estimated at from 70,000,000 to 90,000,000. According to the terms of the Chinese agreement with Great Britain it was merely stated that the Chinese government could not contemplate in any event the alienation of any portion of the Yang-tse valley to a foreign power. Outwardly the British government merely desired to prevent that

region from falling into the hands of a rival nation, but to many Englishmen this promise of the Chinese government seemed a hopeful sign that eventually Great Britain would exercise a protectorate over the Yang-tse valley. It was said that while this would not be done hastily it would come about through the necessity of keeping the region from falling into foreign hands, that the English would occupy the country as they had occupied Egypt, in order to keep others out, and that when once there they would remain. This it was thought would be easily accomplished for a number of reasons. In the first place there was a spirit of dissatisfaction in the provinces of the Yang-tse with the Peking government. In fact there was reported to be a movement for the setting up of an independent kingdom in the Yang-tse valley with its capital at Nanking. One cause of the dissatisfaction on the part of the viceroys of this province was the turning over of the *likin* or inland customs revenue to the Anglo-German banking syndicate as a guarantee for the loan above mentioned. The viceroys had depended largely on this source of revenue for the expenses of administration as well as their personal remuneration. Thus there is no patriotic desire in these regions to maintain the integrity of the Empire. A fact in regard to China which is commonly overlooked is that the people are not homogeneous but seem to be scarcely conscious of national identity. The people of some provinces cannot understand the language spoken in others and there is little sympathy between the different branches of the race. It has been said that the goal toward which China is tending is federalism and that even now the provincial governments are more independent in their respective spheres than the States of the American Union. The bearing of this on the question of the partition of China, if that question shall press for solution, is obviously important.

Internal Disturbances.—The latter part of the year was marked by numerous popular outbreaks which were mainly directed against foreigners. The most threatening of these was in the province of Kwans-tse, formerly the seat of the Tai-ping rebellion, whence it spread to adjoining provinces. The secret society of the Triads, which had been prominent in the Tai-ping rebellion is said to have been active in this revolt. Insurrections broke out in other parts of the country resulting in damage to the property of foreign missionaries. At Peking, when the reactionary party gained the upper hand, their triumph was marked by riots in the streets and attacks upon the members of the British and American legations, and upon American missionaries. The government promptly apologized for these outrages, but they continued in several parts of the Empire throughout the rest of the year. In some quarters a general revolution was feared. After the palace revolution above mentioned, some of the officials who had shown sympathy with the reform movement, were executed, and others were banished or degraded. It was found necessary to land bodies of Russian, British, German and French marines, which were sent to the capital to protect the interest of the legations.

Railway Concessions.—In so far as the competition between foreign concessionaries threatened to affect international relations, a brief reference to recent railway grants has been made in a preceding paragraph. It remains to notice these and other concessions in their bearing upon the economic development of China and the opening up of the country to foreign capital. During 1897 and 1898 many new railway projects were sanctioned and much was accomplished toward the carrying out of those already undertaken. By the beginning of 1898 the railway mileage which was actually completed was very small. On June 30, 1897, the railway from Tientsin to Peking, a distance of seventy-three miles, was open to traffic. In the fall of 1897 it was expected that Russia would complete her Trans-Siberian line in a few years. At that time the first instalment on the loan for a railway from Shanghai to Nanking was completed and surveys on the road had already been made. When these points are connected the line will be pushed on in a short time to Hanchow, and later this point will be joined to Peking. When the Trans-Siberian line joins the Chinese railways, as is expected, there will at last be railway communications between China and Europe. Foreign capitalists have been active in their efforts to secure railway concessions. It was reported in the spring of 1898 that Germans had obtained the right to construct a railroad to Ichow-Fu and thence to Shanghai in addition to a railway connecting Kiao-Chow with Chinan-Fu. Our minister to China, writing under date of June 16, 1898, reports a railway concession to the Russo-Chinese Bank for a line 140 miles long connecting the capital of the Shansi province with Cheng-Ting-Fu in the province of Chihli. He also reported that a line from Hankow had been granted to an American syndicate. The railway originally built to connect Kaiping with deep water on Petang river, has been extended beyond Tientsin. The Manchurian railroad, of which so much has been said in the newspapers in connection with Russia's schemes for aggrandizement, is to start from Onon on the Transbaikal section of the great Siberian railroad and after passing through Manchuria is to connect with the South Ussuri railway at Nikolsk. Its length will be twelve hundred and seventy-two miles, of which nine hundred and forty-five miles will lie in Chinese

territory. This railway concession was the result of a convention between Russia and China formed in the summer of 1896, and the object of the Russians in building this line is said to be not only the promotion of trade between Russia and China, but the strengthening of coast defences. According to the terms of the concession Russia is to build the road at her own expense and to retain control for thirty years, at the end of which time China may purchase the line if she wishes. The Hankow-Pekin line mentioned above was conceded to a Belgian syndicate in return for a loan. The contract was signed on June 26, 1898, and its text is given in the United States Consular Report for November of that year. The railway is a Belgian project, and its construction is to be under Belgian management. It has long been the desire of the more progressive officials in China to connect Peking with Canton by rail, and the building of a line to Hankow, which is half way between Peking and Canton, is a long step toward the realization of that plan. In the absence of funds and of the fit men to carry out the work in China, the government had to look to outsiders, and of foreign nations Belgium seemed the most suitable because of its neutrality and the improbability of its using its advantages for purposes of conquest. For a long time the Belgian representative carried on negotiations at Peking, and at last the contract was awarded. A Chinese loan bearing interest at 5 per cent. was negotiated by the Belgian syndicate, which called in the assistance of French capitalists. The Russo-Chinese Bank was appointed as the financial agent. The rumor that the greater portion of the money was to be subscribed by Russian capitalists led to the alarm of the English and evoked the protest already mentioned. It was provided that the board of managers should be at least two-thirds French or Belgians and that the remaining one-third might be Chinese. It is required to be completed by 1903, and its length is to be seven hundred miles. Among the other important railway projects are the continuation of this line to Canton, the building of a line to Shanghai, to Soochow and Hangchow, and the continuation of the Northern railway to Kirin and Moukden. In this last-named project Russia is to assist if China finds it beyond her financial strength. Some advance has been made also toward the introduction of electric railways. In Shanghai bids were requested in the summer of 1898, for a line about eighteen miles long, based on the overhead wire and trolley system, and a concession was to be given to a syndicate, the franchise running from thirty to fifty years, according to the amount paid by the company to the city government.

The Shansi and other Concessions.—The following statement is quoted from the report of the United States Consul in regard to the Shansi concession, which he describes as the first concession ever made by the imperial government to a foreign syndicate of the right to open and work mines, and build and operate railways, independent of Chinese control: "On the 21st of May 1898, there were signed, in the presence of the ministers of the Tsungli Yamen, articles of agreement which ceded to the Peking Syndicate, Limited, of London, the sole right to open and work the coal and iron deposits of central and southern Shansi and the petroleum deposits of the entire province; also, the right to construct and operate all necessary railways to main and trunk lines and navigable waters for exporting the mining products. This agreement was signed by order of imperial edict, stamped with the seal of the Tsungli Yamen as a visible sign of imperial sanction and authority, and the whole proceedings were verified and ratified by the British and Italian ministers to China. The signing of this contract marks the most important epoch in the industrial policy of China. The precedent has been established of allowing foreigners, for commercial purposes, to own real estate in the interior of China, open and operate mines, and construct and maintain railways. There have been many so-called mining concessions granted in China, but not one of them is worth the paper it is written on. Of the railway concessions, only one—the Belgian Syndicate for the Peking-Hankow Railway—has gotten beyond the preliminary stage, and in none is the syndicate more than the financial agent of the Chinese. These railway syndicates have no voice in the management and not too much security for their money. As a matter of fact, up to date neither the Belgian Syndicate nor any other syndicate has furnished one cent of money."

Then follows a synopsis of the terms of the agreement, according to which the board of directors of the syndicate is to have control of the entire administration. As to the returns to the Chinese government, it is provided that a 5 per cent. producer's tax on the actual cost of extracting coal, iron or other material shall be paid to it together with 25 per cent. of the net profit after the syndicate has received 6 per cent. interest and set aside 10 per cent. as a sinking fund with which to repay capital. As to the resources of the region included in this grant, the consul reports: "The province of Shansi lies to the west of Chihli. It consists of an interior plateau of 3,000 feet elevation, more or less cut up by rivers. This plateau is bounded on all sides by mountains rising to 8,000 and 14,000 feet above the sea. In some places, these ranges have been cut through by rivers: but in all parts they are rugged, and transportation must be effected by pack mules or camels. In the eastern

portion of the province, and running into the province of Honan, are deposits of anthracite coal. The western half has bituminous coal covering some 12,000 square miles and all along the western boundary are deposits of petroleum. At many different points in the coal region are deposits of rich iron ore. The coal strata are practically horizontal, and at an elevation of about 2,500 feet. They show wherever erosion has cut to a sufficient depth. This anthracite-coal vein is unbroken over an area of 13,500 square miles, and its thickness varies from 25 to 50 feet, an average of 40 feet. All this deposit is within the limits of the concession. There are thousands of native coal mines now in operation, and the coal has been used for probably three thousand years. The iron ore is now worked by the natives. This entire region has been examined by William H. Shockley, mining engineer, and Charles D. Jameson, civil engineer, both Americans and in the employ of the syndicate. There is probably no coal field known in the world that can compare with this of Shansi, either in quality or quantity of coal or the possibility of cheap production.

"In addition to the concession in Shansi, there was signed on the 21st of June an identical agreement ceding to the Pekin Syndicate all of that portion of Honan north of the Yellow river (about 10,000 square miles) and another agreement by the terms of which all of the mountainous part of Honan south of the Yellow river is ceded to the Syndicate as soon as work is begun on the Shansi concession. The total area of these concessions is 71,000 square miles, equal to England and Scotland."

CHITRAL. See INDIA (paragraphs on History).

CHOATE, JOSEPH HODGE, one of the leaders of the New York bar. was born in Salem, Massachusetts, in 1832; was graduated at Harvard, 1852, and after passing two years in the Law School of that institution and a year in a Boston law office he was admitted to the Massachusetts bar, 1855. The next year he came to New York City and has lived there since that time. After a year passed with Scudder and Carter, he entered the office of Butler, Evarts and Southmayd, and in 1859 became a member of the firm of Evarts, Southmayd and Choate; he soon became well known in the profession. The present law firm is Evarts, Choate and Beaman. From 1865. Mr. Choate has been connected with many of the most important cases tried in New York; among them may be mentioned the investigation of the case of Gen. Fitz John Porter, the Tweed ring prosecution, the Tilden will contest, the controversy over the fortune of Commodore Vanderbilt, the Chinese Exclusion Act, the suit of David Stuart vs. Collis P. Huntington, the Behring Sea dispute, the arguments on the constitutionality of an income tax, the case of Laidlaw against Russell Sage. Mr. Choate has never before held public office, but his political career began when he took the stump for John C. Fremont in 1856. He has always been a Republican, but in general opposed machine management and on this account has frequently been at odds with the leaders. He was president of the New York State constitutional convention in 1894, and two years later was a candidate for United States senator. He was president of the New England Society, 1867-71, of the Union League Club, of New York City, 1873-77, and of the Harvard Club, 1874-78. Toward the close of the year 1898 Mr. Choate's appointment as successor to Mr. John Hay, as ambassador to the Court of St. James was strongly advocated. He is recognized as a man of upright character and unusual ability and his appointment met with general approval.

CHOLERA. See PUBLIC HEALTH.

CHOSEN FRIENDS, ORDER OF, a fraternal society, dating from 1879, with two grand councils, 570 subordinate councils, and 23,133 members. Since its organization it has disbursed \$12,201,893, and \$831,898 during the last fiscal year. H. H. Morse, New York, Supreme Councillor; T. B. Linn, Indianapolis, Supreme Recorder.

CHRISTADELPHIANS, THE. The report of this sect for 1898 gives 63 churches and 1,277 members, showing an increase over 1890.

CHRISTIAN AND MISSIONARY ALLIANCE, formed in 1897 by the union of the Christian Alliance and the International Missionary Alliance; the objects are "the promotion of a deeper and higher Christian life, and the work of evangelization especially among the neglected classes." The receipts for 1897, were \$262,000. Missionaries were sent to Arabia, India, Thibet, China, Palestine, Japan, the Congo, the Soudan, and South America. Its organ is the *Christian Missionary Alliance*.

CHRISTIAN CATHOLIC CHURCH, was organized in Chicago, February 12, 1896. Among its beliefs is triune baptism. The church has 20 elders, 6 evangelists, 2 deaconess missionaries in India, 3 deaconess missionaries in America, 11 deacons, and one general overseer, the Rev. John Alexander Dowie. Congregations have been established in France, England, India, British Columbia, Africa, and Australia, as well as in Iowa, Ohio, Michigan, Illinois, Pennsylvania, Wisconsin, and Indiana. Zion Seventies, under the leadership of elders and evangelists, and Zion Junior Seventies have been organized. There were 2,000 baptisms during the year

1898. Altogether there are about 200 meeting-places and about 14,000 members. Divine Healing Homes have been established in various places, and about 750,000 copies of *Leaves of Healing* have been circulated. The latest report of the commissioner of education shows that the Christian Catholics have in the U. S. 17 institutions of higher education, with 152 teachers, 1,445 students, and endowment funds of \$716,309.

CHRISTIAN CONNECTION, or Christians (seceding Methodists). At the Quadrennial meeting of 1898, the union with the Christian Church, South, was consummated and arrangements were made for mission work among the Armenians. The Christian Connection was active in church building and generous in missionary offerings, there are 1,424 churches, 1,391 ministers, and 107,868 communicants of the Christian Churches, South, making a total of 1,598 churches, 1,493 ministers and 124,368 communicants.

CHRISTIAN ENDEAVOR. See UNITED SOCIETY OF CHRISTIAN ENDEAVOR.

CHRISTIAN SCIENTISTS (more properly called the Church of Christ, Scientist), a denomination of professing Christians founded in 1866 by Mary Baker Eddy. They believe that sickness and evil are only the creations of the imagination and can be removed by prayer. The principles of the cult are defined in Mrs. Eddy's text book, *Science and Health*. In 1898 the number of persons attending the churches of this denomination more than doubled, a Christian Science board of education was established in Boston and an international board of lecturership of the mother church, consisting of 11 residents of the United States, which gives an elaborate system of public lectures; and a new periodical, the *Christian Science Journal* was begun. The number of churches in 1898 was 415, of ministers 10,000 (an increase of 6,500 over 1897), and communicants 70,000 as against 40,000 in 1897.

There are six regularly organized churches in New York City, three of which have buildings, and the Second Church of Christ, Scientist, is erecting a building at Central Park, West, and Sixty-eighth street. The mother church is in Boston (1,400 members). The Christian Science Publishing House is also in that city, and, in addition to books and pamphlets, issues *The Christian Science Monthly Journal*, *The Christian Science Weekly*, and the *Christian Science Bible Lessons*. Besides the churches, there are 11 Sunday schools, which form the beginnings of new organizations, and 85 public Christian Science reading-rooms in various cities. The growth of the Christian Science movement has been great in England, Germany, Italy, France, Norway, Sweden, South Africa, and Japan.

Towards the end of 1898 much publicity was given to the Christian Scientists both in England and in America; in the former on account of the unsuccessful treatment and death of the noted journalist, Mr. Harold Frederic (q. v.) whose Christian Scientist attendants were subsequently prosecuted by law on the charge of manslaughter, a coroner's jury bringing in a verdict declaring the attendants, Miss Kate Lyon and Mrs. Athalie Mills, criminally responsible for Mr. Frederic's death.

In America cases like the following have been numerous: In Tacoma, Wash., a leader of the Christian Scientist Church died of acute pneumonia after having refused medical attendance and having entrusted the treatment of his disease to the care of a woman in Savannah, Ill., in whose power to cure him even over that great distance he firmly believed. In Cincinnati a man died of typhoid fever refusing any assistance except the prayers and asseverations of his Christian Scientist healer. The "healer" was held for manslaughter, but a decision of the court of common pleas held that the rites performed were in nature religious and not medical and therefore not subject to the State law regarding registration of all who practice medicine. In the same city, however, a month later, a Christian Scientist healer was fined for violating this same law. In Omaha, Neb., a woman died of burns for which she would do nothing that was not prescribed by the Christian Scientists.

The Christian Scientists say, however, that undue attention has been given to the unsuccessful cases which occur indeed in the practice of even the most skillful medical practitioners; and they claim that 70 per cent. of the cases undertaken by them are cured. Their practices should not be confused with the so-called "mind cure," "faith cure" or with the use, as therapeutic agent, of Hypnotism (q. v.).

CHRISTIAN UNION CHURCHES, are composed of the Christian Connection (q. v.), and the Christian Church South, the latter consisting of 102 ministers, 174 churches, and 16,500 members. The Christian Union Church reports for 1898 183 ministers, 294 churches, and 18,214 members. The Disciples of Christ (q. v.), also call themselves Christians.

CHURCH TEMPERANCE LEGION, under the supervision of the Church Temperance Society (q. v.), consists of the Knights of Temperance, Young Crusaders, and Veteran Knights. Its object is to encourage temperance among boys and

men. President, Col. B. F. Watson; secretary, Rev. Melville K. Bailey; headquarters the Church Mission House, New York. The Womens' Auxiliary consists of Mrs. George S. Bowdoin, president; Mrs. Irving Grinnell, vice-president; Mrs. Charles Townsend, treasurer; and Miss H. D. Fellowes, and Miss H. K. Graham, secretaries.

CHURCH TEMPERANCE SOCIETY, organized in 1881, within the P. E. Church, admits those who use liquor in moderation as well as those who abstain. Its motives are to encourage temperance in the young, to rescue drunkards, to restrict the saloons by legislation, and to establish reading-rooms, coffee-houses, working-men's clubs, etc. Officers (1899): President, Rt. Rev. John Williams, D. D., Bishop of Connecticut; vice-president, sixty bishops; chairman, Rt. Rev. W. C. Doane, D. D., Bishop of Albany, vice-chairman, Rev. C. De W. Bridgeman, D. D., treasurer, Irving Grinnell; general secretary, Robert Graham. See the article **CHURCH TEMPERANCE LEGION**.

CIVIL ENGINEERS, AMERICAN SOCIETY OF, founded in 1852, has 2,117 members. The meetings are held monthly at the society's home 220 W. Fifty-Seventh street, New York. President, Alphonse Fteley; secretary, Charles Warren Hunt.

CLAIRVOYANCE. See **PSYCHICAL RESEARCH, SOCIETY FOR**.

CLARK, LATIMER, English electrician and inventor, was born at Great Marlow, March 10, 1822, and died October 30, 1898. Among his many inventions may be mentioned the following: The double bell insulators for telegraph wires and the device for protecting steel telegraph cable, both now in general use; the pneumatic system for transmitting telegrams through pipes; Clark's Standard Cell. In 1861 he proposed the names and the system of volts, ohms, farads, etc., now generally adopted. As a partner of Messrs. Forde and Taylor he superintended the laying of more than 100,000 miles of submarine telegraphic cable in various parts of the world. He was a member of the Institute of Civil Engineers and fourth president of the Institute of Electrical Engineers, a fellow of the Royal Society and of the Royal Astronomical Society, and a chevalier in the Legion d'Honneur. He was partner in a large hydraulic engineering firm. His published writings include: *A Description of the Britannia and Conway Tubular Bridges* (1850); *A Treatise on Electrical Measurement* (1868); with Sabine, *Electrical Tables and Formulae* (1871); *Dictionary of Electrical Measures* (1891).

CLARKE, MRS. MARY VICTORIA COWDEN, the well known Shakespearean commentator, died in Genoa, Italy, January 12, 1898. Born in June 1809, she was one of the very few remaining links that joined the social and literary life of the last part of the century to that of the earlier part which was marked by such a galaxy of literary lights. Daughter of a musician and publisher, wife of an author, and friend of some of England's greatest writers, she seems to have gathered up and reflected both the wise brilliancy and the wise kindliness which devotion to literature and art alone can give.

CLAY. The enormously increased use of this material, has led many State geological surveys to publish special reports on the deposits of clay within their boundaries. Among these may be mentioned one issued by the State College of Pennsylvania, and treating of the fireclays of the State; a second one on the clays of North Carolina issued by the North Carolina Geological Survey, and a third on the clays of northwestern Indiana.

The latest statistics are those for 1897 which give the production as follows:

Common Bricks.....	\$26,353,904
Pressed Bricks.....	3,931,336
Paving Bricks.....	3,582,037
Firebricks	4,094,704
Drain Tile	2,623,305
Sewer Pipe.....	4,069,534
Terra Cotta.....	1,701,422
Fireproofing	1,979,259
Floor Tile.....	1,026,398
Miscellaneous	1,413,835
Pottery	9,450,859
	<hr/>
	60,911,641

CLEARING HOUSE. See **UNITED STATES**.

CLEARY, Most Rev. JAMES VINCENT, archbishop of the Roman Catholic diocese of Kingston, Ontario, died at Kingston, February 28, 1898. He was born in Dungarvan, Waterford, Ireland, September 18, 1828; came to Canada in 1880 as bishop of

Kingston and was made archbishop in March 1889. The Liberal settlement of the Manitoba school question was vigorously opposed by him.

CLEMENCEAU, Dr. GEORGES, a well-known French Radical politician and journalist, prominent in 1898 in connection with the Dreyfus case (See FRANCE, paragraphs on History), was born in 1841. He was the author of a number of forcible articles in the *Aurore*, demanding revision of the Dreyfus case, and appeared in the trial on the side of Zola. One of his articles on the trial led to a duel between him and M. Drumont, of the *Libre Parole*, in which neither combatant was injured.

CLIMATOLOGICAL ASSOCIATION, AMERICAN, organized in New York, September 1883, for the study of diseases of the respiratory organs, together with the influence of climate thereon. Next annual meeting in New York City, in May 1899. President, Beverly Robinson, M. D.; secretary, Guy Hinsdale, M. D., Philadelphia, Pa.

COAL. The production of coal in the United States was: 1897, 200,259,654 short tons; 1898, 208,952,502 short tons. This shows an increase of 4.3 per cent. and is the greatest production known in the United States. The advance was due chiefly to an increased production of bituminous coal, as the anthracite output remained about the same. Pennsylvania was not only the largest producer of anthracite, but furnished more than half the coal mined in the United States in 1898. Illinois was second in the list of coal-producing States, but was somewhat crowded by Ohio and West Virginia the latter being third, becoming not only an important producer but also a successful competitor of Pennsylvania and Ohio, both in the Chicago market and also in the Great Lakes trade. The recent explorations of the United States Geological Survey, have developed beds of coal at numerous localities in Alaska, but comparatively few of them are being worked. During 1898, several hundred tons of bituminous coal were mined on Admiralty Island, but besides this little more than exploitation work had been done. The Kansas University Geological survey has just issued a report on the coal of that State, in which it is stated that the coal-bearing formations underlie nearly a fourth of Kansas. The western limit of this area is definable by a line drawn from the north boundary of the State 25 miles northwest of the Missouri river, southwest to the southern boundary, at a point 125 miles west of the Missouri line. The coal bearing strata are from 2,000 to 2,500 ft. thick, this latter thickness being found in the southern portion of the State. The best coal beds are found in the Cherokee shale, and the belt of these extends from the Weir-Pittsburg locality to Fort Scott, and thence to Leavenworth. The quality of Kansas coal is considered superior to much that is found further west, and the total output for 1898, is estimated at not less than 4,000,000 tons. West Virginia is becoming an important competitor with Pennsylvania in the coal markets, and during 1898, its influence has been felt, much of the output having been sent to Chicago, and also for shipment on the Great Lakes. Much West Virginia coal was used by the United States fleet during the recent war, that from the New River and Pocohontas fields, being considered especially desirable, owing to its low amount of ash and sulphur, high percentage of fixed carbon, and the fact that it is incapable of spontaneous combustion. The export trade in coal for the first ten months of 1898 amounted to 3,782,671 tons, most of this going to Canada and South America. The imports were 1,076,888 tons, and included mostly shipments from Australia to California. An important development in the coke trade has been the increasing use of by-product coke ovens, and the tendency of many iron works to coke their own coal.

COCHIN CHINA is the name applied to the eastern part of the peninsula of Indo-China and loosely identified with the former empire of Anam (q. v.). The present use of the term, however, applies to what is properly called Lower Cochin China which lies at the southern extremity of the eastern portion of the Indo-China peninsula and stretches from Cambodia and Anam on the N. N. E. to the China Sea and the Gulf of Siam. The area is generally given at something over 23,000 square miles, and the population according to estimates of 1897 was 2,034,453, of whom the Anamites were the chief element, but there were also Chinese, Cambodians, Malays, and Malabarians. The French settlers numbered 4,335. The people are mainly engaged in agriculture and the chief crop is rice, of which a great quantity is regularly exported to China, Java and Europe. Other articles of export are cotton, hides, fish, pepper and copra. There has been considerable progress in recent years under the French administration. Post-offices have been established, railway and telegraph lines constructed and the work of education carried on with activity. Along with Anam, Cambodia and Tonquin it forms French Indo-China. See **INDO-CHINA**.

COCHRANE, GENERAL JOHN, New York lawyer and politician, died in New York City, February 7, 1898. He was born at Palestine, New York, August 27, 1812; was graduated at Hamilton College in 1831 and three years later was admitted to the bar; he was surveyor of the port of New York, 1853-57, and from the latter date to

1861 represented the Sixth district in Congress. In the Civil War he commanded the First United States Chasseurs, became in July 1862, brigadier-general of volunteers in the Army of the Potomac, but on account of ill health resigned in February of the following year. For two years he was attorney-general of New York; in 1872 he was a delegate to the Democratic convention at Cincinnati, which nominated for the presidency Horace Greeley, whom General Cochrane vigorously supported; in the same year he was made president of the New York Board of Aldermen. During the temporary retirement of Mayor Hall, at the time of the Tweed scandal, he acted as mayor of the city. He was a Republican member of the Board of Aldermen in 1883, but the next year returned to Tammany Hall and became a sachem of the society.

COINAGE. See UNITED STATES and the articles on foreign countries.

COINS, VALUE OF, FOREIGN. The following tables show the official valuations of foreign coins by the United States' Treasury; 1st, in the case of countries with fixed currencies; and, 2nd, in the case of countries with fluctuating currencies giving the quarterly valuations of the latter from January 1st, 1898, to January 1st, 1899.

A.—Countries with fixed currencies.

Countries.	Standard.	Monetary unit.	Value in U.S. gold	Coins.
Argentine Republic*..	Gold and silver	Peso	\$0.96,5	Gold—Argentine (\$4.82,4) and $\frac{1}{2}$ Argentine; silver—peso and divisions.
Austria-Hungary†	Gold	Crown.....	.20,8	Gold—20 crowns (4.06,2) and 10 crowns.
Belgium	Gold and silver	Franc19,8	Gold—10 and 20 franc pieces; silver—5 francs.

COLLEGE SETTLEMENTS. The college settlement movement owed its origin to the teaching of men like Kingsley, Ruskin, and Greene, and to the practical work of Edward Denison and Arnold Toynbee in the sixties and seventies. It soon spread to America, where the college settlement in New York City, and Hull House in Chicago were opened in 1889. It was reported in 1898 that there were some fifty settlements in Great Britain, and over eighty in the United States. The aims of the settlement are to become the centre of a social life in its neighborhood with a view to its improvement and to aid in the solution of social and industrial problems in cities. There has been formed in the United States a College Settlements Association having for its aim the foundation and maintenance of settlements. A small subscription fee entitles persons to membership. In 1898 the association had chapters at Wellesley, Smith, Vassar, Bryn Mawr, Radcliffe, Wells, the Packer Collegiate Institution, Cornell, Elmira, the Women's College of Baltimore, and Barnard College. It has supported the College Settlement in New York, the St. Mary's Street Settlement in Philadelphia, and the Denison House in Boston. It is the outcome of the efforts for social improvement on the part of college-bred women. Its central organization consists of an electoral board, the president of which in 1898-99 was Miss Vida Scudder, and the secretary, Miss Susan G. Walker, Fiske Hall, Barnard College, New York City. The immediate administration of the settlements is in the hands of local executive committees, each settlement being presided over by a head-worker. The New York College Settlement is in Rivington street where there is a large foreign population consisting largely of Russian and Polish Jews, and the neighborhood is crowded and ill-built. The work of this settlement includes, 1st, efforts to supply a wholesome kind of social entertainment through the organization of various clubs which are connected with the house and at which are given lectures musical recitals, and other entertainments; 2nd, educational work, including a kindergarten, a small vacation school, a library and course of lectures; 3d, industrial work, including instruction in cooking, sewing, and elementary carpentering; 4th, artistic work including music, drawing, and clay modelling; 5th. economic work, including instruction in political economy. Besides this, the settlement maintains a summer home which, during the season beginning June 9th, and closing September 10, 1898, was visited by 232 persons.

The Philadelphia settlement was first established in St. Mary's street, the name of which was subsequently changed to Rodman street. A cottage near West Chester was placed at the disposal of the settlement. Situated in an ill-built, overcrowded quarter, with bad sanitary condition, the settlement attempted to introduce improvements. It favored the establishment of small parks, and in 1895 a number of buildings were torn down, resulting in improving the condition of the neighborhood. The number of workers has greatly increased and lectures, classes, clubs, etc. are maintained. The settlement has become a gathering place for the children and young people of the neighborhood.

Denison House, 91 and 93 Tyler street, Boston, is situated in a district wholly different in character from those in which the New York and Philadelphia settlements

are located. The neighborhood does not contain any large number of the very poor, but comprises for the most part wage-earners living under normal conditions. It is therefore said to offer a good opportunity for the study of the conditions of the average industrial workers. The settlement has organized clubs, cooking classes, kitchen garden work, and has been successful both in the work of education and in that of providing proper social pleasures for the people of the neighborhood. The educational work for the children is divided into the kindergarten department; a primary department, including classes in clay modelling, wood work, sewing, singing; and an advanced department, including classes in carpentering, nature study, color work, drawing, clay modelling, sewing and singing.

The following list of college, social, and university settlements in the United States is included in Mr. John Palmer Gavitt's bibliography compiled for the College Settlements Association.

California.—Casa De Castelar, corner of Castelar and Ord streets, Los Angeles, California; The South Park Settlement, 15 South Park, San Francisco, California; The Manse, 1730 Eighth street, West Oakland, California.

Connecticut.—Social Settlement of Hartford, 15 North street, Hartford, Conn.

Illinois.—Chicago Commons, 140 North Union street, Chicago; Clybourn Avenue Settlement (formerly Olivet Mission), corner Clybourn avenue and Halsted street, Chicago; Elm Street Settlement (formerly Unity Settlement), 80 Elm street, Chicago, Ill.; The Forward Movement (formerly known as Epworth House), 219 South Sangamon street, Chicago; Helen Heath Settlement (All Soul's Church, Chicago), 869 Thirty-third Court; Hull House, 335 South Halsted street, Chicago, Ill.; Kirkland School Settlement, 334 Indiana street, Chicago, Ill.; Maxwell Street Settlement, 270 Maxwell street, Chicago, Ill.; Medical Missionary College Settlement (Seventh Day Adventists' Medical, Missionary and Benevolent Association), 1926 Wabash avenue, Chicago, Ill.; Neighborhood House, 1550 Sixty-ninth street, Chicago, Ill.; Northwestern University Settlements, 252 West Chicago avenue, Chicago, Ill.; University of Chicago Settlement, 4638 Ashland avenue, Chicago, Ill.; The Delano Settlement, corner Foster and Myrtle streets, Evanston, Ill.

Indiana.—Terre Haute Settlement, 28 North First street, Terre Haute, Indiana.

Iowa.—Roadside Settlement (Des Moines Local Union of King's Daughters and Sons), 720 Mulberry street, Des Moines, Iowa; College House, 615 Pearl street, Grinnell, Iowa.

Kansas.—Bethany School, corner North First and Riverview street, Kansas City, Kansas.

Kentucky.—Neighborhood House, 324 East Jefferson street, Louisville, Kentucky.

Maryland.—Lawrence House, 214 Parkin street, Baltimore, Maryland; Locust Point Settlement, 1409 Hull street, Baltimore, Maryland.

Massachusetts.—Ben Adhem House, Mall street, Roxbury, Boston, Mass.; Denison House (Boston College Settlement), 91 and 93 Tyler street, Boston, Mass.; Elizabeth Peabody House, 156 Chambers street, Boston, Mass.; Epworth League House, 34 Hull street, Boston, Mass.; Hale House, 6 Garland street, Boston, Mass.; Lincoln House, 116-122 Shawmut avenue, Boston, Mass.; South End House (formerly Andover House), 6 Rollins street, Boston, Mass.; St. Stephen's House, 2 Decatur street, Boston, Mass.; Willard "Y" Settlement, 11 Myrtle street, Boston, Mass.; The Prospect Union, 744 Massachusetts avenue, Cambridge, Mass.

Michigan.—Berean Social Settlement "Our Neighborhood Cottage," 642 Russell street, Detroit, Mich.; Bissell House, 425 Ottawa street, Grand Rapids, Mich.

Minnesota.—Unity House, 1620 Washington avenue North, Minneapolis, Minn.; St. Paul Commons, Eighth and Jackson streets, St. Paul, Minnesota.

Missouri.—St. Louis Social Settlement, 2501 South Second street, corner Victor street; St. Stephen's House, Sixth and Rutgers streets, St. Louis, Mo.

Nebraska.—Graham Taylor House, 945 North Eighth street, Lincoln, Nebraska.

New Jersey.—Whittier House, 174 Grand street, Jersey City, N. J.; Orange Valley Social Institute, Orange Valley Post-Office, New Jersey; Dundee House, 20 Second street, Passaic, New Jersey.

New York State.—Neighborhood Settlement, the Astral, 184 Franklin street, Greenpoint, Brooklyn, N. Y.; Welcome Hall, 437 Seneca street, Buffalo, N. Y.; Westminster House, 424 Adams street, Buffalo, N. Y.; All Soul's Friendly Aid House, 248 East Thirty-fourth street, New York, N. Y.; Amity Church Settlement, 312 West Fifty-fourth street, New York, N. Y.; Association House, 259 West Sixty-ninth street, New York, N. Y.; Calvary House Settlement, 355 East Twenty-second street, New York, N. Y.; Church Settlement House, 329 East Eighty-fourth street, New York, N. Y.; College Settlement, 95 Rivington street, New York, N. Y.; Community House (The Pro-Cathedral Church), 153 Essex street, New York, N. Y.; East Side House, Seventy-sixth street and East River, New York, N. Y.; Grace Church Settlement, 417 East Thirteenth street, New York, N. Y.; Hartley House, 413 West Forty-sixth street, New York, N. Y.; Normal College Alumnae House, 446

East Seventy-second street, New York, N. Y.; The Nurses' Settlements, 265 Henry street, 279 East Broadway, and 312 East Seventy-eighth street, New York, N. Y.; The Phelps Settlement, 314-316 East Thirty-fifth street, New York, N. Y.; Union Seminary Settlement, 237 East One-Hundred and Fourth street, New York, N. Y.; The University Settlement, 26 Delancy street, New York, N. Y.; Young Women's Settlement, 163 Avenue B, New York, N. Y.

North Carolina.—Log Cabin Settlement, Grace Post-Office, Buncombe county, N. C.

Ohio.—Cincinnati Social Settlement, 300 Broadway, Cincinnati, Ohio; Goodrich Social Settlement, 368 St. Claire street, Cleveland, Ohio; Hiram House, 183 Orange street, Cleveland, Ohio.

Pennsylvania.—College Settlement of Philadelphia, 617 Carver (formerly St. Mary) street, Philadelphia, Pa.; Eighth Ward House, Locust street, above Ninth, Philadelphia, Pa.; Neighborhood Guild (hitherto known as Minster street Neighborhood Guild), 618 Addison street, Philadelphia, Pa.; Princeton House, 505 Pine street, Philadelphia, Pa.; St. Peter's House, 100 Pine street, Philadelphia, Pa.; Kingsley House, 1709 Penn. avenue, Pittsburg, Pa.

Wisconsin.—Happy Home Settlement, 336 Jefferson street, Milwaukee, Wisconsin.

COLOMBIA, REPUBLIC OF, the most northwestern country of South America, comprising nine departments under Governors. Before the promulgation of the constitution, Aug. 4, 1886, these departments had been distinct States, each under a President. The estimated area is 513,938 square miles and the estimated population (1895) about 4,000,000, including 150,000 uncivilized Indians. The census taken in 1870 gave the population as 2,951,323, and the official estimate in 1881 was 3,787,600. The capital is Bogotá and the departments are known as follows: Antioquia, Bolivar, Boyacá, Cauca, Cundinamarca, Magdalena, Panama, Santander, and Tolima; of these Cauca is the largest with an estimated area of 257,462 square miles, and Santander the smallest with 16,409 square miles. The most populous are Boyacá, Cauca, and Cundinamarca, and the least populous, Magdalena. The most important cities are Bogotá (population about 120,000), Barranquilla (40,000), Medellin (40,000), Bucaramanga (20,000), Cartagena (20,000), Cúcuta (10,000).

Government.—The chief executive is a President chosen by an electoral college for six years; he has ministers of Foreign Affairs, Finance, War, Public Instruction, the Interior, and the Treasury, all officially responsible to Congress. The legislative power is vested in a Congress consisting of a Senate and a House of Representatives, there being 27 Senators and 66 Representatives; the latter are chosen for four years by universal suffrage, the ratio being one member for about 50,000 inhabitants. The governors of the departments are appointed by the President and are removable at his pleasure; but the departments have retained some of the prerogatives of their former sovereignty, such as control of finance. Dr. Rafael Nunez, who was elected President for the fourth time in 1892, died September 18, 1894, and was succeeded by the Vice-President, Senor Don Miguel Antonio Caro, who is the present incumbent.

Revenues and Expenditures.—Official estimates in pesos (\$0.436) of revenue and expenditure for fiscal years ending June 30:

	1891-2	1893-4	1895-6
Revenue	26,023,160	27,312,381	26,226,300
Expenditure	26,979,325	33,502,386	35,773,882
		1897-8	1898-9
Revenue		34,361,000	38,305,000
Expenditure		35,771,013	

It was estimated that the expenditure for the year ending June 30, 1899, including the deficit for the previous year and the decreased value of paper currency, would not exceed 34,000,000. The revenue is derived largely from customs duties, which were estimated for 1897-98 at 19,500,000 pesos. On June 30, 1896, the internal debt, exclusive of paper currency amounting to 30,862,352 pesos, aggregated 7,525,156 pesos. The external debt, due largely to British creditors, in 1896, was, including arrears, £3,514,442.

Industries.—The principal industries are mining and agriculture. The latter, however, is not in an advanced state, and only a small part of the country is under cultivation. Much of the land is fertile, but at present useless, for lack of means of transportation. Manufacturing industries are almost unknown. Most tropical products may be cultivated successfully; coffee is the most important and its cultivation is extending rapidly; in many parts of the country cacao, sugar-cane, and all kinds of fruits grow in abundance; there are also produced tobacco, vegetable ivory, rubber, wheat, maize, plantains, indigo, vanilla, cabinet and dyewoods, and medicinal

plants. In Tolima are large grazing districts. The total number of cattle, horses, mules, and asses in Colombia is estimated at 3,465,000; of swine, sheep, and goats 3,487,000.

Mineral Resources.—Of the mineral resources gold is the most important, but there are also many silver mines. Other minerals are worked to a greater or less extent, including iron, asphalt, petroleum, salt, copper, lead, mercury, platinum, manganese (7 mines), cinnabar (14 mines), emeralds (32 mines). The gold-bearing districts of Colombia extend through the west central section of the country from Ecuador to the upper districts of the State of Bolivar, but the metal is found to some extent in all of the nine departments and silver in many of them. On both sides of the above mentioned district the rock is non-auriferous, but placer deposits are found. Gold mining in Colombia seems to be giving fair and regular returns; there are thousands of mines, many of them worked in small and primitive fashion, but some have come into the possession of syndicates which carry on the work with more modern methods. The State of Tolima is rich both in gold and silver. The gold is found in placer deposits and the silver ore, much of which is of low grade, is "concentrated" at the mines and shipped to England for the final smelting. The syndicates are largely English, although there are companies which represent the French, Germans, and Americans. In the State of Antioquia are a great many mines most of them small, in which both quartz and placer deposits are worked in rude and native fashion. These mines, however, are probably the richest of any in Colombia, and the shipments of gold from Medellin, the capital, average about \$300,000 a month. Recently the gold mines in the region of Darien have been reopened. They lie between Real and Cana, were formerly worked by the Spaniards, and at present are very difficult of access. Previous to 1888 the mines had not been worked for more than a century and a half; at this time they were reopened by an English company but the enterprise was attended with little success until 1893 when some of the old Spanish workings were struck ninety feet below the surface. This rock, although culled over by the Spaniards, yields from 1 to 1½ oz. a ton, and a much larger yield is expected from the virgin lode. It is said that the Espiritu Santo mine at Cana produced for the Spaniards between 1680 and 1727 more than \$30,000,000.

Commerce.—Value in pesos of foreign commerce:

	1893.	1894.	1895.
Imports	13,403,299	10,711,207	11,528,365
Exports	14,630,332	15,962,019	15,088,406

The chief imports are textiles, food-stuffs, beverages, and iron and steel; the exports follow very closely the principal products mentioned above, excepting cereals. The coffee export in 1895 amounted to 21,500 tons. Of the total imports about 60 per cent. enter by Barranquilla and 20 per cent. by Cartagena. The transit trade across the isthmus is very important. In 1896 there were carried from Colon to Panama: from Europe 92,137 tons, from New York 51,417; for Europe 56,071, for New York 33,701; local traffic in both directions, 28,219.

Railways.—The following is a list of the more important railways, giving their ownership and length:

Northern Railway (Bogotá and Zipaquira) National.....	31 miles
Girardot (Bogotá and Juntas de Apulo) National.....	24 miles
Cucuta (Madrid and Puerto Villa Migar) Colombian.....	34 miles
Sabana (Bogotá and Facatativá) Colombian.....	24 miles
Antioquia (Puerto Barrio and Monos) Department of Antioquia.....	32 miles
Cartagena to Calamar, American (U. S.).....	65 miles
Panama to Colon, American (U. S.).....	47 miles
Cauca (Buenaventura and San Jose), American, (U. S.).....	21 miles
Puerto Colombia (Santa Marta and Sabanilla) English	46 miles
Baranquilla to Sabanilla English.....	16 miles
Yeguas to Honda English.....	15 miles
Total	346 miles

The following extensions to these roads have been proposed, most and perhaps all of which will be constructed: the Puerto Colombia to Heredia on the Magdalena River; the Cauca to Cali, 64 miles; the Antioquia to Medellin, 91 miles; the Yeguas-Honda to La Maria, 7 miles; the Girardot to Madrid, 48 miles; the Cucuta to the Venezuela border.

Army.—At each session of Congress the strength of the national army may be determined but in the case of war the President may call for what he deems is a sufficient number. In 1896 the peace footing was placed at 10,000.

Education.—Primary education is free, but not compulsory. In 1894 there were 1,817 primary schools, with about 89,000 pupils and 15 normal schools with about 600 students. There is a national university with about 1,600 students, and four colleges belonging to departments with 1,083 students; there are also 34 public institutions for secondary education. A library, museum, and observatory are owned by the government. The religion of the country is Roman Catholic, but other faiths are tolerated.

History.—The event that attracted most attention in the history of Colombia during the year 1898 was the re-opening of the difficulty with Italy in the matter of the Cerruti case. In 1885 Ernesto Cerruti, an Italian subject doing business in Colombia was thrown into prison by the political party in power on the ground that he had sympathized with its opponents; his business was broken up and his personal property seized. After negotiations it was decided by both governments to submit the case to the Spanish court for arbitration, but the decision was unsatisfactory and President Cleveland was agreed upon as the final arbitrator. The latter decided that Colombia should allow damages to Cerruti to the extent of about \$300,000 for the loss of his personal property, and further stated that the Colombian government should guarantee him against claims of his partners. The personal damages appear to have been promptly paid to Cerruti, but the partners in his business preferred claims which were supported by the Italian government, but resisted by the Colombian. Matters reached a crisis in July, when Colombia broke off diplomatic relations, and the Italian government despatched a fleet to Colombian waters. The representatives of the United States and Great Britain again intervened with the effect of bringing about an adjustment which was accepted by Italy and the latter abandoned the coercive measures which she had proposed. It was announced that the matter was settled to the satisfaction of the Italian government on August 14, but there was a hitch in the proceedings and an apparent intention on the part of Colombia to break off diplomatic relations in the middle of September. Again the intervention of friendly powers prevented a rupture, and the matter was apparently compromised.

COLONIAL DAMES OF AMERICA, organized in New York May 23, 1890, was the first society of patriotic women founded in the United States. Its aims are patriotic and educational, and its especial care is collecting relics and preserving traditions of the thirteen original States. It also furthers the celebration of national holidays and events and cultivates a spirit of reverence for American history and of patriotism among the young. President, Mrs. John Lyon Gardiner; Vice-Presidents, Mrs. Thomas W. Ward and Mrs. James W. Gerard; Treasurer, Mrs. Oscar E. Schmidt; Secretary, Mrs. Timothy M. Cheesman; and Historian, Miss Julia L. Delafield. Headquarters, 156 Fifth ave.

COLONIAL DAMES OF AMERICA, NATIONAL SOCIETY OF, distinct from the foregoing, has branches in the thirteen original States, in the District of Columbia, and in twenty-two other States. The membership now of 3,500, consists of those "who are descended in their own right from some ancestor of worthy life who came to reside in an American colony prior to 1750, which ancestor, or some one of his descendants, being a lineal ascendant of the applicant, shall have rendered sufficient service to his country during the colonial period, either in the founding of a commonwealth or of an institution which has survived and developed into importance, or who shall have held an important position in the colonial government, and who, by distinguished services, shall have contributed to the founding of this great and powerful nation." President, Mrs. Justine Van Rensselaer Townsend; Vice-Presidents, Mrs. Gillespie, Philadelphia, and Mrs. W. W. Gordon, Savannah, Ga.; Secretary, Mrs. William Reed, Baltimore, Md.; Treasurer, Miss Elizabeth Byrd Nicholas, Washington; and Registrar, Mrs. Emil Richter, Portsmouth, N. H.

COLORADO, a western State of the United States with a land area of 103,645 sq. m. Capital, Denver.

Agriculture.—Colorado is undergoing an agricultural development that would be remarkable in any State and is especially noteworthy in one popularly supposed to be a purely metallic region. Official reports for the calendar year 1898 showed the following productions and values of leading staples; corn, 3,113,892, \$1,245,557; wheat, 6,729,565, \$3,768,556; oats, 3,063,191, \$1,255,908; barley, 353,952, \$162,818; potatoes, 2,564,331, \$1,384,739; rye, 47,484, \$23,742; and hay, 1,760,728 tons, \$9,507,931—total value \$17,349,251. The dairy products had a value of about \$15,000,000, and the orchards about \$5,225,000. In live-stock the appreciation in 1898 was still more pronounced, viz.: horses 148,687; mules 8,667; milch cows 91,666; oxen and other cattle 973,259; sheep 1,655,551; and swine 20,713—total head, 2,898,543. The sales of livestock realized \$6,200,000, and the wool clip \$265,000.

Industries.—Reports of 1898 showed that Colorado had maintained her newly-gained rank of first gold-producing State in the Union. Authorities differed as to the actual output, but all agreed on an amount exceeding that of California. The mint authorities at Denver estimated the production of 1897 at \$22,000,000; another esti-

mate placed it at \$22,500,000; and the most conservative of all fixed it at \$19,579,637. There was a general agreement that the Cripple Creek district had yielded steadily over \$1,000,000 per month, or \$12,500,000 in the year. Gilpin, San Miguel, Clear Creek, and Lake counties followed in productiveness in the order given. The latter, which contains Leadville, yielded \$1,000,000, and the four counties together, about \$8,500,000. With the increase in the production of gold there has been a steady decrease in that of silver, the yield in 1897 being valued at \$13,062,400. Other mineral products were lead, \$2,287,000; copper \$1,167,200; iron \$3,368,000; and coal \$5,275,000. The agricultural, mining, and live-stock interests yielded approximately \$92,350,000 in the year. In 1898 there was a revival in the mining industry. In 1898 the output of gold was estimated at \$24,500,000. The number of men employed in mining was 30,231. The coal production was 3,565,660 tons. Cattle-raising, agriculture, fruit-raising, and general building operations were all in an exceptionally flourishing condition. No less than 4,174,037 tons of coal were produced in Colorado in 1898. The production of lead, copper, silver, iron and manganese, building stones, marble and onyx surpasses that of the previous year. Petroleum is about the same. (See also articles ASPHALTUM, FULLER'S EARTH and MINING.) The new commercial products of the year are uranium, gilsonite and sulphur. Wire tramways and railroad switch extensions have improved means of transportation. The mountain streams are being used to aid the generation of electricity and the power is transmitted to various points for consumption.

Banking.—On October 31, 1898, there were 37 national banks in operation and 28 in liquidation. The active capital aggregated \$4,807,000; circulation \$1,739,268; deposits \$35,446,575; and reserve \$14,672,775. The State banks on June 30, 1898, numbered 38, and had capital, \$1,641,964; deposits, \$5,285,333; and resources \$7,631,906. The exchanges at the United States clearing-house in Denver during the year ending September 30, 1898, aggregated \$140,809,492, an increase of \$18,958,860 in a year.

Education.—At the end of the school-year 1896-7 there were 100,880 children enrolled in the public schools, of whom 69,606 were in daily attendance. The value of all public school property was \$4,093,304, and the expenditures of the year, including over \$1,320,000 paid to 3,120 teachers, for salaries, aggregated more than \$2,385,000. There were 41 public high schools, with 196 teachers and 4,635 pupils, 7 private secondary schools, with 33 teachers and 297 pupils; and a public and private normal school, with 30 teachers and 518 students. For higher education there were 4 colleges and universities, co-educational and for men only, with 106 professors and instructors and 1,023 students; 2 schools of technology, with 36 instructors and 403 students; and 2 theological, 2 law, and 4 medical schools. The Colorado Agricultural College at Fort Collins, endowed by Congress, received from the Federal government \$22,000 in 1897 and \$23,000 in 1898. In the last year there were 310 periodicals, of which 39 were dailies, 237 weeklies, and 28 monthlies. The legislature in 1897 appropriated \$240,423 for the State educational institutions, and authorized the erection of an industrial school for girls in or near Denver.

Finances.—The total assessed valuation on November 30, 1897, was \$198,000,000, the lowest amount since 1885, and the State tax was \$4.10 per \$1,000. The gross debt, December 1, 1897, was \$3,476,573, the larger part comprising outstanding warrants, and the treasury held assets of \$778,933, leaving the net debt \$2,697,640. Besides the above State tax rate there is a poll tax of \$1 per capita, formerly 50 cents. The net debt was increased \$404,328 in a year.

Population.—As estimated by Federal officials the population on June 30, 1898, was about 525,000. The following estimates of cities and towns were given: Pueblo, 36,000; Colorado Springs, 23,000; Cripple Creek, 7,000; Victor, 5,000; Cañon City, 5,000; Grand Junction, 4,370; and Creede, 2,500.

The State Elections of 1898.—The elections were interesting from the fact that there were fifteen tickets in the field and the Fusionists carried everything before them. Arapahoe county, including Denver, cast 10,000 Fusion majority, and El Paso county, including Colorado Springs, 4,000. The Republicans won only in the eastern part of the State. The Fusionists have also an overwhelming majority in the legislature. Charles S. Thomas (Dem.) was elected Governor, receiving 92,274 votes and a plurality of 43,394, the largest ever given to any Governor of Colorado. The delegates to the House of Representatives are: John F. Shafroth (Sil.), from Denver, and John C. Bell (Pop.), from Montrose; Senators: Edward O. Wolcott (Rep.), from Denver, and Henry M. Teller (I.), from Central City. Officials: Charles S. Thomas (Dem.), Governor; Francis Carney (Pop.), Lieutenant-Governor; E. F. Beckwith (Pop.), Secretary of State; John F. Fisher (Rep.), Treasurer; Geo. W. Temple (Rep.), Auditor; C. L. Moses (Rep.), Adjutant-General; D. M. Campbell (Rep.), Attorney-General; and Helen Grenfell (Rep.), Superintendent of Education. Chief Justice John Campbell (Rep.); Associates, Luther M. Godderd (Dem.), and William H. Gabbert (Dem.); and Clerk, H. G. Clark (Rep.). In the State legislature there are 30 Democrats, 8 Republicans, 29 Populists, and 33 Silverites.

COLORED MASONIC BODIES consist of 31 grand lodges in the U. S. and one in Canada. The earliest was the African Lodge, No. 459, for which a warrant was given on Sept. 24, 1784, to Prince Hall and 15 other colored masons. Its hundredth anniversary was celebrated in Boston on Sept. 24, 1884, by a large gathering of colored masons. The oldest lodge now existing is the Prince Hall Grand Lodge, an outgrowth of the former, organized in 1808, which erected a monument in Boston to Prince Hall in 1895. The largest lodge is that of Missouri, having 5,000 members. The colored masons in the U. S. and Canada number 35,123; Royal Arch, 13,000; Knights Templar, 10,325; Nobles of the Mystic Shrine, 1,326; and A. A. S. Rite, 5,712. See ODD FELLOWS.

COLORED METHODISTS, are composed of the African Methodist Episcopal, Union American Methodist Episcopal Zion, and Colored Methodist Episcopal Church. The A. M. E. is the strongest and carries on the largest missionary work in Haiti, Africa, and Liberia. It consists of 5,850 churches, 5,725 ministers, and 750,354 members. In 1898, the A. M. E. Zion, ordained the wife of Bishop J. B. Small to elder's orders, which created much discussion. 86 new churches were erected, and the Christian Endeavor work was important. The missions in Africa were much extended and agencies were arranged for Cuba, Porto Rico, and Hawaii. The reports for 1898 give 1,749 churches, 2,786 ministers, and 519,681 members. The district occupied by the Union American M. E. Church lies between New York, and Washington, and Pittsburg. It has not progressed as rapidly as the others, having but 61 churches, 63 ministers, and 2,675 members. The Colored M. E. church is an off-shoot from the white M. E. Church, South, 1874. It has extensive local missionary work, and publishes many periodicals. During the year many churches were erected and the congregations increased greatly. The report gives 1,300 churches, 2,187 ministers, and 199,206 members.

COLTON, GARDNER QUINCY, M. D., New York dentist, died in Rotterdam, Holland, August 11, 1898. He was born at Georgia, Vermont, February 7, 1814; became a chairmaker; entered the College of Physicians and Surgeons, New York, in 1842. He was associated with Horace Wells, a dentist of Hartford, Connecticut, who discovered in 1844 that the inhalation of nitrous oxide gas obtunded sensibility, and who used it as an anæsthetic about the same time in 1846 that Dr. Wm. T. G. Morton of Boston, Wells' former partner extracted teeth from patients under its influence. The honor of the original discovery has been claimed on behalf of each of these three men. It was stated that from the time of this discovery Dr. Colton and his assistants pulled 1,000,000 teeth; but the gas was not used to any great extent until 1863.

COLUMBIA, BRITISH, a province of the Dominion of Canada, with an estimated area of 383,300 sq. m.

Mineralogy.—The production of the precious metals in the calendar year 1897 was gold, \$2,724,657; silver, \$3,272,836; copper exports, 6,093,461 pounds. Coal yielded 988,796 short tons, of which 671,313 tons were exported. At the close of 1898 it was estimated that the year's output of the precious metals would exceed \$12,000,000 in value, the greater part being mined in the Trail and Kootenai districts, and that the increased output of the province and the Klondike region would give Canada fifth place among gold-producing countries, with a total yield valued at \$14,190,000. There were about 3,000 companies operating in the province.

Fisheries.—The value of all fishery catch in the calendar year 1896 was \$4,183,999; value of all apparatus used, \$2,614,578; principal catch, salmon, \$3,142,732, and halibut, \$113,828; exports of fishery products (1897) \$3,400,645.

Commerce.—In the fiscal year ending June 30, 1897, the imports of merchandise aggregated in value \$7,001,861, of which \$6,926,504 was entered for home consumption; exports, \$14,017,568; duty collected, \$1,558,889. Registered vessels in direct foreign trade had an aggregate tonnage of 28,604, and all vessels, British and foreign, engaged in the coasting trade, 3,551,340. Navigation along the coast was facilitated by 16 lighthouses.

Banks.—On June 30, 1897, there were 26 post-office savings banks, with 2,392 depositors and \$578,600 deposits, and one government savings bank with 3,229 depositors and \$955,804 deposits.

Railways and Telegraph.—In 1897 the total length of railways was 860 miles and of telegraph lines, all land, 567 miles. At the session of the provincial legislature in 1898 a "public works loan act" was passed, providing for a loan of \$5,000,000 for railroad purposes. Charters were granted for 21 new railways, and a total of 1,040 miles of new railway was subsidized, which will call for \$4,160,000. New lines projected include one of 400 miles from the west coast of the province to Teslin Lake, and one of 80 miles from Boundary Creek to Robson, each to receive \$4,000 per mile. The act prohibits the employment of Chinese or Japanese either in the work of construction or operation of any subsidized undertaking.

Education.—In 1897 there were 213 common schools, with 223 teachers, 6,332 en-

rolled pupils, and 3,808 in daily attendance; 27 graded schools, with 149 teachers, 9,005 enrollment, and 5,912 attendance; and 4 high schools, with 12 teachers, 461 enrollment, and 280 attendance. The expenditures were \$236,681, of which \$200,637 was for teachers' salaries. There were ten public libraries with a total of 11,303 volumes. Periodicals of all kinds in 1898 numbered 39.

Finances.—The revenue of the province in the year ending Sept. 30, 1897, was \$1,383,048; expenditure, \$1,569,071; gross debt, \$6,586,004; assets, \$2,301,989; net debt, \$4,284,015.

Population.—The Indian population in 1897 was 24,946, a decrease of over 10,000 in five years. There were 35 schools for Indian youth, which had an enrollment of 1,352, and attendance, 789. The Indians cultivated 11,207 acres of land, had 22,736 head of live-stock, and received \$588,344 for their fish, fur, and other industries. Local estimates in 1898 gave Vancouver 22,000 population; Rossland, 5,000; Nelson, 3,000; Union, 2,500. See CANADA.

COLUMBIA UNIVERSITY, non-sectarian, at Morningside Heights, New York City, founded 1754; in 1898 had 325 instructors, 2,157 students and over 250,000 volumes in the library. The value of the new site is estimated in the last report of President Low as \$6,879,011. The gifts for the year amounted to \$354,416 in money, and real estate in the City of New York valued at \$1,100,000 was given by Duc de Loubat for the purpose of endowing the library. Volumes to the number of 16,377 were added to the library; 495 degrees were conferred and 20 courses of lectures given at the University, the Metropolitan Museum of Art, the Museum of Natural History, and Cooper Union. In 1898 the new gymnasium was opened under the directorship of Dr. Watson L. Savage. It is on a large scale, having one of the largest swimming tanks in the country and an excellent running track. A most important step in the direction of broader relations with the educational work of the country at large has been the closer union in 1898 between Columbia and the Teachers' College, a step made possible by the removal of Columbia to Morningside Heights in 1897. The finances are kept separate as before, but the Teachers' College has become a part of the university system. The number of officers of instruction in the Teachers' College in 1898 was 61, of students including the extension classes and the Horace Mann school, 1,491. President, Seth Low, LL. D. See PSYCHOLOGY, EXPERIMENTAL, and UNIVERSITIES AND COLLEGES.

COMEDIE FRANCAISE. The important new works represented in 1898 were: *La Martyre*, by Jean Richepin, the theme of which was the conflict of Christianity and Paganism; *Le Berceau*, a play in three acts, on divorce, by Brieux; and *La Confiance*, by Louis Lavigner, performed on the 259th anniversary of Racine. On the 7th of March Mlle Suzanne Reichenberg, "*La même doyenne*," retired.

COMETS. See ASTRONOMICAL PROGRESS.

COMMERCE. See the articles on the countries.

COMMERCIAL TRAVELERS' HOME ASSOCIATION OF AMERICA, founded in Binghamton, New York, in 1892, by commercial travelers "To provide and maintain a home and hospital for the care, maintenance and relief of worthy indigent commercial travelers, their dependent wives, widows and infant children, and to build, furnish and maintain in connection therewith a school for the benefit of said infants, and to provide and furnish such other aid and assistance to the members thereof and their families as may be provided by the by-laws." The real estate, on which the home is now being erected, is valued at \$50,000. Forty branches of the Home Association have been organized in various cities. The *Home Magazine*, started as a private enterprise, was purchased by the association in 1894, and is published regularly. President, George E. Green, Binghamton, New York; Secretary and Treasurer, L. M. Georgia.

COMPARATIVE LITERATURE SOCIETY, organized in 1897, membership 300. Council: T. W. Higginson, H. H. Furness, W. D. Howells, R. H. Stoddard, and Charles Dudley Warner; Charles Sprague-Smith, Managing Director. The lectures are given in Carnegie Hall, New York. Study topic for 1899, Folklore.

CONDENSER, ABSORPTION IN. See PHYSICS (paragraph Electrical Measurements by Alternating Currents).

CONDUIT ELECTRIC RAILWAYS, are those which have some form of conduit or trough below the level of the rails, either between or at the side of the track. Usually there is a slot or continuous opening to the street through which the "plow" projects from the bottom or side of the car. Inside the conduit, supported upon suitable insulators, pins or brackets, are generally the conductors against which suitable rollers or rubbing blocks, forming part of the plow are pressed. In this way current can be taken from one conductor, up through the slot on a wire embedded in the plow, through the motor and again back to the other conductor. There are other types employing a closed conduit, and in one of these the slot is closed by a flexible sheet which is depressed by a roller projecting from the car until the flexible cover

touches the conductor inside the conduit. Still other types employ closed conduits and operate magnetic switches with current from storage batteries on the car; the current being conveyed to the switches through buttons or contact plates embedded in the paving between the tracks, and suitable contacts on the car, or in some cases powerful magnets on the car operate switches in the conduit.

It is beyond the scope of this book to describe the many automatic, magnetic, and other conduit systems, none of which are in operation to-day on a commercial scale with the exception of the first mentioned, which is now regarded as the only practical form. The automatic conduit system was first installed in Budapest, Austria, in July 30, 1889, the conduit being at one side so that the slot rails formed one track. The slot rails are bolted to cast iron yokes placed 33½ ft. apart. The conduit proper is formed of concrete and is about 11 inches wide and 13 inches high. The next attempt was in Chicago, Ill., in March, 1892, where 1½ miles of conduit road was installed using the Love system. This is much the same as the others, only the conductors are nothing more than the ordinary trolley wires suspended inside the conduit from small, light insulators; this system failed owing to leakage and break downs and was finally abandoned.

Section of Conduit used on the Lenox Avenue, New York Line of the Metropolitan Street Railway.

now operates some 200 miles of surface railway from temporary stations; eventually power for the entire system will be supplied from a 45,000 H. P. Standard located at about the centre of the city. (See ELECTRIC LIGHT AND POWER STATIONS.) The Third Avenue Ry. Co., of New York is also changed over to conduit and will erect a 65,000 H. P. power station at one end of its lines. St. Louis is changing over its cable lines and the indications are that Chicago and other large cities both here and abroad will do the same in the near future.

This system while more expensive is less dangerous and far more satisfactory in all ways, than the old style of overhead trolley. It is very expensive to construct, ranging as high as \$50,000 per mile of single track, the average being about \$30,000 per mile. This large cost is due to the very considerable amount of work required to shift the pipes, sewers and other underground structures along the line of track where they conflict with the conduits.

Section of the Conduit used in Washington, D. C., Showing shape of Yoke and position of Conductor Rails.

In the spring of 1895 the Metropolitan Street Railway Co., of New York City, installed a conduit system on its Lenox avenue line in which cast iron yokes were placed every 5 ft., to which the rails and slot rails were bolted. The conduit was formed of concrete in the centre of the track and is about 14x14 inches and circular in shape. During the summer and fall of 1895 the Metropolitan Railway Co., of Washington, D. C., equipped a portion of its lines with the same system, later changing its entire lines to the conduit system. Within the past year the Capital Traction Co., of the same city changed its entire system, some 13 miles, from cable to conduit electric. The Metropolitan Street Ry. of New York City has also converted its lines from horse to this system and

Section of the Washington, D. C., Conduit, showing Insulators and Manhole.

As installed at present a trench about 2 ft. deep at the centre and 6 ft. wide is dug along the line of the road and heavy cast iron yokes, weighing from 400 to 500 lbs., are placed every 4 ft. To these yokes are bolted the tracks, and the rails forming the edge of the slot; forms are placed along the centre of the trench from yoke to yoke and concrete is packed around them to form the conduit; when set the forms are removed by sliding out of an opening left for that purpose. Between and at the sides of the track, at intervals of 15 ft., small covered openings are made into the

conduit and at these points heavy cast iron and porcelain insulators are bolted to the slot rails. These have pins projecting down into the conduit to which steel "T" rails weighing about 23 lbs. per yard, in lengths of 3 feet, are bolted securely. This brings the conductor rails about 6 inches apart and just 13 inches below the street surface. The car plows extend through the slot down into the egg-shaped conduit and have rubbing blocks which press against the parallel flat faces of the conductor rails. Current is supplied to these steel conductors by feeders or cables which run in underground conduits alongside the track from the power station, and are attached at intervals to the conductor rails. Drainage is secured by frequent outlets to sewers, while manholes distributed along admit of examination or repairs.

CONGER, OMAR D., ex-United States Senator from Michigan, was born at Cooperstown, New York, in 1818; died at Ocean City, Maryland, July 11, 1898. He was three times sent to the Michigan Senate by the Republicans, was then (1869) elected to Congress, and was returned from 1870 to 1880 inclusive. He was United States Senator 1881-87.

CONGO FREE STATE as defined and recognized by the European States assembled at the Council of Berlin in 1885, has an area of about 900,000 square miles with a population estimated in 1896 at 30,000,000 and consisting chiefly of Bantus. In 1897 the European population numbered 1,474 of whom the majority were Belgians. Its boundaries have been defined by various agreements since the year 1884, that separating its territories from the possessions of France being determined in 1894. By this latter agreement France acquired the "right of police" along the left bank of the Congo and over the course of the Mbomu. In 1895 the Belgian government recognized "the French right of preëmption over the Belgian possessions on the Congo in case of their alienation by sale or exchange in whole or in part." The climate is tropical and the soil fertile, producing palm oil, rubber, various gums, ground nuts, camwood, beeswax, orchilla, coffee, tobacco, rice, maize, ivory, etc. Among metals, gold and copper have been discovered. The chief exports are palm oil, rubber, rice, orchilla, gum, copal, ground nuts, and camwood. The trade has been for the most part with Belgium and the Netherlands, although England has come in for a share of the commerce. Under the Belgian rule the colony has on the whole prospered. There has been since 1888 considerable activity in railway construction, especially in 1896 and 1897. The Congo railway, for which the Belgian Chamber of Deputies provided a loan in 1896, has greatly shortened the caravan route from Matadi to Stanley Pool. It was expected that the line would be completed in 1899. The central government is at Brussels and consists of the King of the Belgians and the departments of Foreign Affairs, Finance, and the Interior. The local government is administered by a governor-general and the heads of separate executive departments together with a commander of the forces. The army is composed of native troops with European officers. There is a small navy on the Upper and Lower Congo. The main items of revenue were customs, postage, transport and an annual subsidy of 1,000,000 francs granted by the King for the ten years ending in 1900. The chief items of expenditure for 1898 were administration, public force, marine, and public works. The state has a coinage and postal service and belongs to the postal union.

Commerce, Internal Trade, and Finance.—The statistics of the commerce of Congo for the year 1897 were published in the United States Consular Reports of July 1898. According to these the general foreign trade amounted to nearly \$7,913,000 of which \$4,535,500 were imports. This total exceeds that of 1896 by over 31 per cent. Almost all of the trade is what is known as special commerce, that is the exports of articles produced in Congo and the imports of foreign commodities which are to be consumed there. The development of trade has been steadily increasing ever since 1886. The increase in the export trade is largely due to the increase in the amount of rubber exported. The greater share of the foreign commerce is taken by Belgium. The imports consist chiefly of manufactures of all kinds. The revenues have also been increasing. There are duties on imports varying as follows: A 10 per cent. ad valorem duty on arms, ammunition, gunpowder and salt; a duty of 15 francs per hectoliter on distilled spirits; a 6 per cent. ad valorem duty on all other goods of every description except the free list which covers locomotives, cars, and materials for railway construction, scientific instruments or things pertaining to education, seeds for planting, etc. There are export duties on the following native products: Coffee, peanuts, India rubber, copal, palm oil, ivory nuts and sesamum. Direct taxes are levied on land covered by or attached to buildings; on the number of employees and servants; and on steamboats, sailing vessels and row boats. The government also taxes the India rubber, having proprietary right in the production of that article. There is a tax of 10 francs on each contract for personal labor and 100 francs for a general permit to employ any number of employees. There are no restrictions on the foreign merchant except in regard to the importation of firearms, which is absolutely prohibited and the sale of intoxicating liquors which is limited by law to certain districts in the State. It is not permitted moreover to trade in the production of the State forests or public domain without securing a special concession.

History.—The Congo Free State took the place of the so-called Congo International Association. Upon its recognition at the International Conference at Berlin February 26, 1885, it formed treaties with other nations and acted in all ways as a sovereign state. In 1890 as the result of an international conference at Brussels the government of the Congo Free State was authorized to levy certain duties on imports. The King of the Belgians who had acquired full sovereignty over this country bequeathed by will his sovereign rights to Belgium in 1889. In 1890 the Belgian government declared the territory inalienable and reserved by agreement with the Congo Free State the right of annexation after the year 1900. The power of the Arabs in Kasongo where the notorious slave dealer, Tippu Tib, has long held sway was overthrown in 1892. The military operations in the country have added greatly to the expense of the administration, and besides the annual subsidy from King Leopold, the Belgian government has voted a considerable sum to supplement the revenue. The Dervishes have caused the local authorities a great deal of trouble, and in December 1896, an expedition under Captain Chaltin entered the country of the Mahdists and on February 17 attacked a force of about 2,000 who held a strong position. The Mahdists were put to rout abandoning their baggage and ammunition. A still larger force of Mahdists, however, blocked the progress of the Congo troops at Rejaf, but the latter were again successful and gained another supply of spoils from the retreating enemy. The effect of this expedition was to rid this portion of the country of the Mahdists and to extend the authority of the Congo government. But in the meanwhile the government had suffered a set-back through the mutiny of certain native troops who had been impressed into the service of the State. These consisted chiefly of the tribe known as Batatelas, who were treated with severity by their officers and had a further grievance in the fact that they had been led to fight at a long distance from their homes. They revolted in February 1897, and killed their commander. They were joined by other rebels and a considerable force succeeded in making their escape and in carrying off a large supply of guns and ammunition. They passed to the southward and were repulsed with difficulty from an attack on an English fort in which the small garrison was aided by Congo State troops.

Criticism of Official Methods.—The missionaries tell a different story of the effects of Belgian rule on the Congo from that which is given out by the administration. The treatment of the natives is said to have been cruel in the extreme and the State is charged with having itself engaged in the slave trade which it has ostensibly suppressed. The atrocities practised by the black troops in the interior have been made the subject of frequent complaint. The missionaries say that in one district of the Upper Congo over forty villages were burned by native soldiery and that it is a common thing to see baskets full of human hands taken as trophies to the authorities to show that the troops are not negligent of their duties. According to the missionaries, neither women nor children are spared and this terrible punishment is inflicted not for rebellion or for crimes against the State, but merely for failure to supply the requisite quantity or quality of rubber as tribute. The missionaries complained that their charges either received no attention at all or led to threats of punishment on the ground that they were trying to incite the natives to withhold the tribute of rubber. But some of these reports reached the home authorities and the Governor-General of the Free State afterwards made some efforts to put a stop to the abuses and to punish the offenders. It is difficult to obtain a trustworthy account of this matter. The authorities of the Free State claim that the administration has done a great deal to improve and civilize the natives and they cite among other instances of this, the suppression of the slave trade, the building of roads and railways, the establishment of a flotilla on the river, the development of trade, the fostering of industries, and the moral and intellectual improvement of the race through education. On the other hand it is said by some that some of the most evil practices of the savages are still carried on. It is even maintained that cannibalism has increased rather than diminished under the European rule, notwithstanding that it is a crime according to the laws of the State.

Recent Progress.—In 1898 public attention was drawn to the Congo Free State by the opening of the railway from Matadi to Stanley Pool through the cataract region early in July. In October 1898, Mr. Demetrius C. Boulger wrote an interesting review of the work on the Congo during the last twelve years. Some of the points which he brings out are worthy of mention here. In the first place he maintains that the credit for such progress as has been made in the Free State belongs wholly to the King of the Belgians, Leopold II, from whose private purse have come the revenues which enabled the work of civilization to begin, and to be carried through its earlier stages on the Congo. The Berlin Conference above mentioned did little for the State beyond giving it a name. In fact it hampered it from the first by imposing on it complete freedom of trade,—a measure which deprived it of an important source of revenue. At the same time the conference laid on the Free State the duty of suppressing the slave trade. None of the signatory powers gave the little community any aid in carrying out this latter purpose. Naturally the means at its own disposal

were inadequate. The Arabs gained the district around Stanley Falls and Tippu Tib set up his slave empire there. In 1889 a new conference was held in Berlin to take measures for the abolition of the slave trade in Central Africa. In the following year an anti-slavery conference met at Brussels and while it increased the obligations resting on the Free State, it sanctioned measures for procuring revenue. Up to that time the means for withstanding encroachments of the slave power had been supplied from the private purse of Leopold. Now, however, the Free State secured the right of levying an import duty up to 10 per cent. The increase of its revenue enabled the State to carry this war against the Arabs to a successful issue. The region where a few years ago every atrocity connected with the slave trade was committed with impunity, is now restored to freedom under the flag of the Congo Free State, and this victory was gained without the aid of other powers. The downfall of the Arabs was now complete, but that was not the end of the petty but exhausting warfare which the government of the Congo had to carry on. We have already seen that on the very day when the dervishes were routed at Rejaf the Batetela contingent of the native army broke out in revolt. In order to suppress this mutiny the Belgian authorities had to make a further sacrifice of lives and money; but the work was virtually completed in 1898. The Congo State troops were successful in several engagements with the mutineers and in the autumn of 1898 the power of the latter seemed to be utterly broken.

In works of peace, the progress of the Congo government has been even more important. These wars were necessary for the suppression of the slave trade. Their successful issue enabled the government to enforce the clauses in the penal code making cannibalism and the capture of slaves capital offenses. The suppression of barbarous practices was followed by attempts to civilize the blacks. The import of firearms was checked and efforts were made to control the liquor traffic. It had formerly been asserted that the authorities were engaging in the liquor trade for their own benefit; but this charge does not appear to be borne out by the facts. On the Lower Congo the Portuguese, English, and American merchants were already carrying on a liquor traffic when the Congo government was established and treaty conventions prevented it from suppressing this trade. It appears to have done all that was in its power to do, that is it levied as high a duty as possible on the importation of liquors. On the Upper Congo, however, where it had a free hand, the government prohibited the importation of liquors within certain defined districts. The entire line of the railway is included in these districts. Where the trade is permitted, it is subject to very strict regulations, limiting the sale to Europeans under heavy penalties. The law forbids a merchant to use alcohol for purposes of barter with the natives, and dealers are required at regular intervals to render detailed accounts of the quantities sold and of the names of the purchasers.

Among the other measures which have been taken for the elevation of the negro is that which relates to labor contracts. The effort has been made to prevent the making of such contracts as would in reality reduce the black to a position of servitude. It is said that so far as the relation of employee to employer is concerned, the black laborer is better off than the European workingman. The law renders contracts inviolable and requires that the black laborer shall know the precise terms of his engagement. When an employer engages him to work at a distance from his home he is bound to send him back free of expense.

In many other ways the Belgian officials have tried to improve the condition of the natives. There are many evidences of a kindly feeling between the two classes. During the recent expeditions there were many incidents which bore witness to the devotion of the black troops to their white officers—a devotion which would hardly subsist if the reports of official cruelty were well grounded.

As to the financial and commercial development of the Congo Free State it should be noted that while in the first year of its existence its revenue was less than £3,000 it had risen in 1897 to £367,334. During the early history of the State the revenue represented but a small fraction of the expenditure, the bulk of the latter having to be met by the King's subsidy, loans from the Belgian government and other outside sources. In 1897, 68 per cent. of the expenditure was met from the revenue of the Free State, notwithstanding the exceptional expenses of the military operations and the cost of telegraphs and other works of improvement. Commerce has also developed with great rapidity notwithstanding the fact that it is only in recent years that the railway has supplied facilities for transportation. The export of the Congo Free State rose from about £70,000 in 1886 to £600,000 in 1897. The resources of the country have by no means been fully developed. New fields for productive labor are being opened, notably in the cultivation of coffee and cocoa. It is expected that the efforts to improve the native labor will result in far greater productive efficiency, and it is said that a period of increased prosperity has already begun. These are among the blessings which the writer above mentioned emphasizes as the result of Belgian activity on the Congo. Another point worth noting is the fact that this region is held by a neutral pacific power indisposed to aggressive measures and un-

likely to complicate the problems of African politics. It is a government moreover which is pledged to the policy of the "open door."

CONGREGATIONALISM. See CONGREGATIONALISTS.

CONGREGATIONALISTS, originated in the English Independents. The national council was held at Portland, Ore., in July 1898, the first general meeting on the Pacific Coast, and its tenth triennial session. Missionary funds were not as generously provided as in previous years, but the work of missionaries in India and China was most successful, and much is expected of the missions in the Caroline Islands. The next International Congregational Council will be held in Boston in September 1899, and the next triennial meeting in Portland, Me., in October 1901. There are at present 5,614 churches, 5,475 ministers, and 625,864 members. The latest report of the Commissioner of Education shows that the Congregationalists control 24 institutions of higher education, with 442 teachers, 4,070 students, and endowment funds amounting to \$8,219,495.

CONGREGATIONAL METHODIST CHURCH, organized in 1852 in Monroe county, Georgia, has its operations chiefly in the South. In 1898 this church reported 240 churches, 210 ministers, and 12,500 members, showing a very slight increase since 1894-5.

CONGREGATIONAL NATIONAL COUNCIL, composed of delegates from the Congregational churches, organized in 1871, meets once in three years. Its next meeting will be held in Portland, Me., in October, 1902. Officers: Rev. Frederick A. Noble, Moderator; Rev. H. A. Hazen, Auburndale, Mass., Secretary; Rev. S. B. Forbes, Treasurer; and Rev. W. H. Moore, Registrar.

CONGRESS OF THE UNITED STATES. See UNITED STATES.

CONGRESSIONAL LIBRARY, founded in Washington in 1800, was destroyed at the capture of Washington in 1814, after which Thomas Jefferson gave his library as a nucleus. The new library building was opened to the public Nov. 1, 1897, and has remained open every day with the exception of Sundays and legal holidays from 9 A. M. to 10 P. M. Many improvements in the efficiency of the service were made during 1898; books are delivered to the readers at numbered desks; and by means of a tunnel and railway books are also delivered to the branch office in the Capitol building. From Nov. 1, 1897, to Sept. 1, 1898, there were 63,493 visitors; from January, 1898, to September, 1898, 103,711 books were supplied in the reading rooms, and 15,509 books were taken from the library. In 1898 the Chinese books (mainly derived from the library of the late Caleb Cushing, the first American Envoy to China), were catalogued by means of the courtesy of His Excellency Wu Ting-fang, the Chinese Ambassador to Washington, who permitted some members of his staff to do the work. This collection consists of 237 standard works—classics, history, poetry, medicine, fiction, etc.; and 2,547 Keuns (unbound volumes). There are a few duplicates. Several bulletins—one on Cuba, one on maps of the Northwest from 1588 to 1898, and one on the Philippines (prepared by the Peace Commissioners in Paris), were published. The laws on copyright were compiled, condensed, and issued in the form of a bulletin. The copyright fees earned and paid into the treasury for 1897-98 amounted to \$55,926,501, of which \$45,711 were for American books and articles and \$8,842 for recording the titles of foreign works. A gallery of rare Americana was opened during the year. The prints collected by the late Gardiner Greene Hubbard were given to the library by Mrs. Hubbard in March. A pavilion for the blind was opened in the new library, containing books, periodicals, and music in raised letters, obtained partly by copyright, by gift, and by purchase. It contains 219 volumes; 50 sheets of music; 40 maps and charts; 78 magazines; and 166 weeklies. Daily readings are given here. A reading-room for children was also set apart, with about 12,000 volumes. A mail and supply department was also created.

The report for the year ending June 30, 1898, gives the expenditures as \$126,243.01, of which \$114,744.38 were for salaries; \$9,498.63 for the purchase of books, etc.; and \$2,000.00 for contingent expenses. The additions were chiefly "to fill gaps," especially in the way of periodicals and newspapers, for it is proposed to have a complete set of every periodical mentioned in Poole's Index. Another aim is to have full sets of an author's works. Especial attention is being given to American literature and Spanish publications, especially in the departments of history, jurisprudence, and geography, particularly what concerns the Antilles and Philippines. Some historical and bibliographical purchases were made in Germany and France. An appropriation of \$15,000 was given to increase the departments of the library. There are now 832,107 books, with 126,985 copyright deposits (duplicates), and 226,972 pamphlets. The growth in 1898 was: 25,472 volumes (to which should be added 5,832 volumes in the Smithsonian deposit); 2,646 periodicals; 1,388 maps and charts; 5,024 art books and prints; 47 MSS.; 556 law-books; and 10,848 volumes and pieces of music, making in all 45,981 additions. The President's nomination of Samuel J. Barrows for Librarian to succeed the late John Russell Young, was not accepted.

CONIFERÆ. See BOTANY.

CONNECTICUT. One of the New England States of the United States, with an area of 4,990 sq. m. Capital, Hartford.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1898: corn, 1,657,785 bushels, \$862,048; wheat, 6,000, \$5,280; oats, 562,562, \$202,522; rye, 259,056, \$155,434; buckwheat, 65,759, \$36,825; potatoes, 2,530,000, \$1,391,995; and hay, 616,714 tons, \$6,876,361—total value, \$9,530,385. Live-stock comprised, horses, 43,682; milch cows, 143,098; other cattle, 60,588; sheep, 31,745; and swine, 54,165—total head, 339,278.

Industries.—The annual report of the Bureau of Labor Statistics issued in 1898 compares the results of an examination of 768 manufacturing establishments on July 1, 1896 and 1897. The number of persons on the different payrolls was 88,934 in 1896 and 87,907 in 1897; amount paid in wages, \$40,404,002 in 1896 and \$36,271,729 in 1897; average hours of labor in all establishments in both years, 56 per week. The report also gives details concerning 200 selected employes engaged in a variety of industries. The average rate of wages was \$12.65 per week; annual cost of living 73.7 per cent. of possible earnings; average annual cost of living per member of family, \$154. Of the whole number 47 were house-owners, 125 were rent payers, and 28 paid neither rent, interest, nor taxes. There were upward of 1,450 factories in operation, employing over 136,000 persons. Connecticut and Rhode Island constituting a single United States internal revenue district under the name of the first, it is impossible to give a correct review of Connecticut's great tobacco interests. In the calendar year 1897 there were credited to the revenue district 138 dealers in leaf tobacco, 61 general manufacturers, 493 cigar manufacturers, and an output of 41,740,996 cigars, 372,050 cigarettes, and 26,267 pounds of smoking tobacco. It is safe to assume that the greater part of these figures belong to Connecticut.

The annual report for 1898 of the Bureau of Labor Statistics (Jan. 3, 1899) gives returns from 564 manufacturing establishments, which in 1898 employed 15,669 persons, an increase of six per cent. over 1897. Wages disbursed were \$32,498,059 or 14.6 per cent. more than in 1897. The cotton goods factories show 1,094,068 spindles, as compared with 951,007 in 1890, an increase of 15 per cent. Wages took 31.1 per cent. of product value, as compared with 29.4 per cent. in 1890. Ten per cent. of the workers were boys and girls under 16 years of age. The value of woollen goods produced was \$11,887,227, paying 22 per cent. of product value in wages. Knit goods were valued at \$3,630,550, wages being 26.7 per cent. of product value and silk goods \$7,488,485 with 23 per cent. wages. The textile industries employ 31,535 persons, 15,493 being women.

There are 139 trade unions in the State. Of these 105 have a membership of 9,298 men and 1,439 women. Only twelve strikes have occurred in their history, which, in the case of some of the unions, reaches back to the year 1850.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise at the ports of Hartford, New Haven, New London, and Stonington amounted in value to \$479,362, a decrease of over \$680,000 in a year; exports, nothing, same as in previous year.

Banks.—On October 31, 1898, there were 80 national banks in operation and 18 in liquidation. The active capital aggregated \$21,281,070; circulation, \$8,469,557; deposits, \$38,893,049; and reserve, \$11,495,422. The State banks, October 1, 1897, numbered 8, and had capital \$2,240,000, deposits \$5,692,909, and resources, \$9,435,142; loan and trust companies, same date, 12, with capital, \$1,245,000, deposits, \$6,091,167, and resources \$8,307,407; and mutual savings banks, same date, 89, with depositors, 36,661, deposits \$155,969,798, and resources \$166,175,213. The exchanges at the United States clearing houses in Hartford and New Haven in the year ending September 30, 1898, aggregated \$205,030,688, an increase of \$8,142,997 in a year.

Insurance.—In 1898 there were 37 insurance companies of various kinds operating under State charters. Of these, 8 were fire companies, reporting capital \$10,150,000, and surplus \$13,200,563; 9 were life companies, 7 of which reported aggregate assets \$151,588,275; 17 were mutual fire companies, 14 of which reported aggregate surplus \$1,677,701; and 3 were miscellaneous companies, one of which reported assets \$2,237,638, and two an aggregate surplus \$3,404.

Education.—At the close of the school year 1896-7, the enrollment in the public schools was 143,921; average daily attendance 101,063; number of teachers, over 4,000; value of public school property \$9,344,690; and expenditures \$2,959,825, including \$1,837,518 for teachers' salaries. There were 64 public high schools, with 279 teachers and 6,126 pupils; 58 private secondary schools, with 164 teachers and 2,684 pupils; 3 public normal training schools, with 79 teachers and 527 students; 3 colleges and universities, co-educational and for men only, with 194 professors and instructors and 2,398 students, a school of technology, with 12 instructors and 107 students; and a law, a medical, and three theological schools. There were 189,728 children of school age in Connecticut in October 1898, being an increase of 5,392 over October 1897. This increase indicates a total increase of population in the State

for that period of about 25,000. The Storrs Agricultural College at Storrs Station, endowed by Congress, received from the Federal government \$22,000 in 1897 and \$23,000 in 1898. The law prohibiting child labor in factories and sanctioning the employment of agents having power to compel school attendance, has yielded excellent results. The increase in attendance has gone beyond the increase in enumeration, notwithstanding the withdrawals to private schools. Details of the public school fund on September 30, 1897, showed investments in bonds and mortgages, bank stock, and real estate, with cash in the State treasury, aggregating \$2,007,080, and net income for the year \$112,477. In 1898 there were 201 periodicals, of which 50 were dailies, 109 weeklies, and 27 monthlies.

Churches.—Reports of the principal denominations for 1897 are summarized as follows: Baptist, 140 churches, 118 settled pastors, 24,243 members; Congregational, 323 churches, 256 pastors, 62,456 members; Protestant Episcopal, 151 parishes, 36 missions and chapels, 221 clergy, 30,140 communicants; Roman Catholic, 186 churches 96 stations and chapels, 233 clergy, 250,000 estimated Roman Catholic population.

Finances.—Receipts for the year ending September 30, 1897, \$2,382,373; expenditures \$2,550,080; total funded debt, \$3,240,200, assets \$123,028, net debt, \$3,117,172; assessed valuation \$534,465,257—the highest in more than ten years. The legislature in 1897 made important changes in the provisions regulating the investment of savings banks deposits, a notable one being the provision that “when any loan or investment is made by a savings bank, the names of the directors or trustees consenting thereto shall be entered upon the records of said bank.”

Population.—As estimated by Federal officials, the population on June 30, 1898, was about 865,000. Local estimates gave New Haven, 112,000; Hartford, 72,000; Bridgeport, 66,000; Norwich, 25,000; Stamford, 20,000; and Middletown, 17,000.

Sociology.—The constitutional provision of 1897 that all voters must be able to read in the English language, and adopted by an overwhelming majority of the popular vote makes the following statistics interesting: In 1897, 8,791 children of native parents were born in the State and 8,286 of foreign parents, and while 11,225 American-born citizens died only 3,487 deaths occurred among the foreign-born. Of the total births only 41.2 per cent. were of native parents; 58 per cent. were of parents, one or both of whom were foreigners.

The philanthropy of Connecticut has been somewhat remarkable. The report of the State Board of Charities for the year ending September 30, 1898, showed that the Board visits 176 institutions for the care of the delinquent, defective, and dependent classes. This number includes eighty-eight almshouses and the amount of State aid given during the year was \$658,190. Recommendations are made for the appointment of a State commissioner of prisons, a State commission in lunacy, a State reformatory for women, and a separate cottage department for epileptics at Lakeville. There were 64 convictions in 1898 for violations of the fish and game laws. There were 93,450 shad caught in State waters, the largest for ten years, and 20,093 more than in 1897.

Harbor Improvements.—Great interest was manifested in the harbor improvements, a natural consequence of the war. The Navy Department purchased Napatree Point, off Stonington, where important fortifications will be erected. This point commands Stonington Harbor, Block Island, Watch Hill, and waters east of the Race, and a battery there will be of great service to the batteries on Great Gull and Fisher's Island. Connecticut's improvements of rivers and harbors for the year ending June 30, 1898, show that no less than 5,755 cubic yards of rock were removed from Pawcatuck; 99,225 cubic yards of material from the Connecticut river; 53,355 from the Housatonic River; 137,700 cubic yards by dredging at Bridgeport; 67 tons of rock from the channel at Saugatuck; 21,956 cubic yards of material from Five-Mile River Harbor, and 35,000 cubic yards of mud were removed from Greenwich Harbor. Here a channel 6 feet deep, 45 feet wide, and half a mile long was made. Three breakwaters were nearly finished at Duck Island; but the proposed work in connection with the building of a harbor of refuge at the entrance of New Haven Harbor was not carried out. Channels were made in Stamford Harbor and the harbors of Cos Cob and Mianus were improved.

The "Charter" Discovery.—Some excitement was aroused by the Rev. W. De Loss Love, corresponding secretary of the Connecticut Historical Society discovering that what has long been supposed to be the original Connecticut charter is but a copy. The matter was referred to Mr. Hubert Hall, an antiquary of London who considers it unauthentic. Mr. Love accepts his testimony and will discuss the matter in a forthcoming book. Some members of the Connecticut Historical Society think this parchment which is now hanging in the Secretary of State's office in Hartford, is the charter revoked in 1685 by James II, and which was hidden in the old Charter Oak by Joseph Wadsworth, and which, brought forth in 1688, made the law for Connecticut from 1688 to 1818.

Elections and State Officers.—The State convention of the Republican party was peculiarly ardent. In the elections Gov. Lounsbury received 81,018 votes, having a

plurality of 16,738. The delegates to the House of Representatives are: E. Stevens Henry (Rep.), from Rockville, Nehemiah D. Sperry (Rep.), from New Haven, Charles Russell (Rep.), from Dayville, and E. T. Hill (Rep.), from Norwalk. The Senators are: Orville H. Platt (Rep.), from Meriden, and a Republican. Officials: George E. Lounsbury, Governor; Lyman A. Miles, Lieutenant-Governor; Huber Clark, Secretary of State; Charles S. Messick, Treasurer; Thompson S. Grant, Comptroller; George Haven, Adjutant-General; and F. A. Betts, Insurance Commissioner, all are Republicans. Chief Justice, Charles B. Andrews (Rep.); Associates, David Torrence (Rep.), Frederick B. Hall (Rep.), Simeon E. Baldwin (Dem.), and William Hammersley (Dem.); and Clerk, George A. Conant. In the State legislature there are 200 Republicans and 76 Democrats.

CONSTANTAN, See PHYSICS (paragraph Boiling Point of Ozone).

CONSTITUTION OF MATTER. See PHYSICS (paragraph Potential Matter and Vortex Motion).

CONSUMERS' LEAGUE. The objects of this organization may be summarized from the constitution of the Consumers' League of Pennsylvania. This document states that the purpose of the organization is first to improve the condition of women and children in retail stores patronized largely by women, second to obtain from retail merchants information and advice with a view to establishing a practical standard of a "fair house," to which these merchants will be asked to conform; and thirdly to place in the hands of the greatest possible number of consumers a list of the stores in which the greatest number of conditions are known to conform to such a standard. Thus it is thought to place the responsibility for the condition of the employees in retail shops on the consumers. It is held that the latter should give their support to those employers who treat their employees with fairness and consideration. It is recognized that under the pressure of competition the employer is often driven to impose hardships on his employees. As an offset to this tendency the Consumers' League tries to increase the custom of such employers as show some consideration for the comfort of their employees in spite of such competition. To do this it publishes what is known as a "white list," giving the names of the "fair houses." The qualifications which entitle a retail store to be placed upon the list have to do especially with wages, hours, and physical conditions. The New York Consumers' League requires that equal wages shall be given for work of equal value irrespective of sex, that wages shall be paid by the week; that in departments where women only are employed the minimum wages shall be \$6.00 per week and rarely below \$8.00; and that when fines are imposed they shall be paid into a fund for the benefit of the employees. As to hours, it is held that a "fair house" is one in which the hours are from 8 A. M. to 6 P. M. with three-quarters of an hour for lunch, and one-half holiday once a week at least during two summer months. Further qualifications are the giving of a vacation of not less than one week with pay in the summer season, and the compensation of all over time work. As to physical conditions, it is required that they shall conform in all respects to the present sanitary laws and that measures shall be taken to promote the comfort and convenience of the employees, such for instance as the placing of seats behind counters and permitting their use. It is further demanded that no children under fourteen years of age shall be employed.

CONSUMPTION. See TUBERCULOSIS.

COOLEY, THOMAS MCINTYRE, a prominent jurist and constitutional lawyer, died at Ann Arbor, Michigan, September 12, 1898. He was born at Attica, New York, January 6, 1824; settled in Michigan in 1843 and three years later was admitted to the bar. Having compiled the general statutes of the State, he became in 1858 reporter for the Michigan Supreme Court and held this position for six years; he published eight volumes of reports and a digest of the Michigan decisions. He became a professor in the law department of the University of Michigan in 1859 and subsequently dean of the faculty. He was elected judge of the State Supreme Court in 1864, and again in 1869 and 1877 for terms of eight years, being chief justice 1868-69. Upon the establishment of the department of political science in the University of Michigan in 1861, Judge Cooley became professor of constitutional and administrative law; he was also dean in this department and occupied the chair of American history in the school of arts. For three years he lectured on law at Johns Hopkins University. President Cleveland appointed him a member of the Interstate Commerce Commission, of which he became the chairman (1887); he retired in 1891 on account of ill health. His publications on legal subjects have been accorded high rank; among them are: *The Constitutional Limitations which rest upon the Legislative Power of the States of the American Union* (1868); *Blackstone's Commentaries* (1870); *Story's Commentaries on the Constitution of the United States, with Additional Commentaries on the New Amendments* (1873); *Law of Taxation* (1873); *Law of Torts* (1879); *General Principles of Constitutional Laws of the United States* (1880); *Michigan, a History of Government* (1885). Judge Cooley wrote most of the articles on law in Appleton's *American Cyclopaedia*.

COOPER, THOMAS SIDNEY, R. A., died 1898. He was born at Canterbury, Eng-

land, September 26, 1893; his early life was largely a struggle against adverse circumstances, but in 1823, through the influence of Sir Thomas Lawrence, he entered the Royal Academy school. For a time he was a drawing master at Canterbury, and then went to Brussels, where he studied (1827-30) under Verboeckhoven, the animal painter, and achieved considerable success in his art. He first exhibited at the Academy in 1833; in 1845 he became an A. R. A. and in 1867 an R. A. As a painter of animals he is said to be supreme, and his works have probably been copied more than those of any other artist of his time. He took much interest in his native town and in 1882 presented it with a gallery of art. In 1890 he published a book of reminiscences entitled *My Life*. Among his best pictures are "Cattle Reposing" and "King of the Meadows."

COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART, an educational institution at the junction of Third and Fourth avenues, New York City, founded in 1857 by Peter Cooper, gives free instruction in science and art, stenography, typewriting and telegraphy, has a free library and gives courses of free lectures on popular topics. It has a well equipped museum for the study of the art of decoration, a free library of 34,702 vols., and reading room, and has day and evening classes. In 1897 there were 40 instructors, 4,672 students in the various courses. It has a permanent endowment fund of \$1,515,508. President, Edward Cooper. See HEWITT, ABRAM S.

COPPER. Production.—The production of copper in 1898 showed a marked increase over that of 1897, as will be seen from the following figures: 1897, 510,190,719 lbs; 1898, 546,367,793 lbs.

The States of Montana, Michigan, and Arizona, were the three leading producers, and their product showed respectively a decrease of 7.5 per cent., an increase of 8.9 per cent., an increase of 37.2 per cent. The higher price of copper caused the increased production. The United States furnished over 60 per cent. of the world's supply during 1898, and 56 per cent. of the American production was exported. The important foreign sources of copper ore are the Rio Tinto District in Spain, the Mansfield District in Germany, Southern Africa, Newfoundland, British Columbia and Mexico.

Metallurgy.—The chief methods used for the treatment of copper ores in the United States continue to be matte smelting, single fusion in the blast furnace, and electrolytic refining. The second is still used in the Arizona districts for smelting the oxydized ores, but matte smelting is slowly superseding it as the unoxydized sulphide ores are encountered, and this latter method is the one most used in the United States. Much copper is refined electrolytically and the *Mineral Industry* for 1897 contains an excellent article on this subject.

The Copper Plant.—In Queensland there has been discovered a plant which nearly always grows in a soil that contains copper and is therefore used as a means of finding this metal. Its name is *Polycarpæ Spirostylis* and it has been called the copper plant. It occurs over the entire copper region of Queensland, but more especially close to deposits of that metal or in water courses which are impregnated with the solution of copper. Its chemical analysis by the government chemist Brownly Henderson shows that it contains a large amount of copper, a quantity much above that which could be accounted for as a result of accidental absorption.

COREA, an Asiatic kingdom formerly tributary to China, but since the Treaty of Shimonoseki of May 1895, independent, has an estimated area of 82,000 square miles, with a population variously estimated from 8,000,000 to 16,000,000. In 1897, the foreign element consisted of 10,000 Japanese, 4,000 Chinese, and about 3,000 of other races. Seoul is the capital with about 200,000 inhabitants.

Commerce.—Corea is almost wholly an agricultural community, but in recent years its commerce has greatly increased. The year closing December 31, 1897, is said to have been more prosperous in respect to foreign trade than any year preceding. The U. S. Consular Report dated August 1898, states that the total net trade of Corea for the previous year was almost double the highest figure it had previously reached. The increase of commerce was very marked even during the war between Japan and China which was waged largely on Korean soil, the large amount of money spent by the Japanese troops there having supplied the Koreans with a purchasing medium. After the war many Chinese merchants came to Corea and aided in the development of trade. Another thing which promoted foreign commerce was the comparative failure of the Japanese harvests of rice at a time when the Korean harvests were good. Then in 1897 the Korean government spent large sums for public works. In 1897 the imports amounted to about \$5,000,000 and the total exports, including over \$1,000,000 in gold, to \$5,504,006. The coast trade was especially active during 1897. The Consular Reports do not show how the trade with Corea is shared among foreign nations, but it is estimated that of the imports a larger amount consisted of English manufactures than of the products of any other country, and the greater part of the English manufactures imported were cotton goods. Cotton goods, in fact,

seem to have been the chief article of import, a considerable supply being derived also from Japan. Besides this, there is an important trade in yarns with Japan, which also sends to Corea a considerable supply of matches. The German trade is chiefly in needles and aniline dyes. The United States in 1897 sent to Corea over \$232,000 worth of American kerosene. Besides this there was a considerable importation of American machinery. Of the exports the heaviest item is rice, which in 1897 amounted to nearly \$3,000,000. Next in importance were gold-dust, beans and ginseng. The foreign shipping is chiefly Japanese. In 1897 no American merchant ships visited Corea. Most of the goods for Corea are trans-shipped in Japanese or Chinese ports. Between Corea and the ports of China and Japan there are two important lines of steamships. There are a good many Korean coast steamers and the coasting trade has developed considerably of late. As to the opening of new ports, there were two opened in the autumn of 1897. In one of these was Chenampo in the north, the port of entry for the northern capital Peng Yang, the latter being the trading center of a fertile grain-producing and mining country. The other port opened at that time was Mokpo on the southwest coast, also opening up a rich country to foreign trade. In the summer of 1898 the government announced its intention of opening four more new ports to foreign trade. This would give Corea ten open ports, namely, Seoul, Chemulpo, Fusan, Genaan, Mokpo, Chenampo, Peng Yang, Sung Chin, Kuhn San, and Masampo. It was also said that a tract of land for a general foreign settlement was to be allotted on Deer Island in Fusan harbor, the Russian coaling station on Deer Island being located within its limits.

Production and Industries.—The chief crops are rice, wheat, beans, barley, millet, oats, and other grains; besides tobacco. Ginseng is a very important crop, this drug being highly valued by both the Koreans and the Chinese for its curative properties. It is exported in large quantities to China where there seems to be an almost unlimited demand for it. Its production is carried on around Songdo, the ancient capital. The mineral resources of Corea are considerable, including gold, copper, iron, and coal. Placer mining is the method followed for obtaining gold. A concession was granted to an American company for a gold mine at Wom San near Peng Yang, the northern capital. This scheme was reported at the close of 1897 as having made considerable progress. The Russians and Germans have also received mining concessions. The native miners are said to do their work well, to be content with low wages and easy to deal with. In 1898 it was reported that the prospects for trade were good. The rice crop during the summer of 1897 was somewhat deficient and the high price of rice in the autumn led to an attempt to prohibit its export. In the spring of 1898 the high price still continued, but there were signs of an intention on the part of the farmers to take advantage of it by the reclamation of new land. Korean manufactures are still undeveloped and none are made for foreign export. In some industries, however, the people show considerable skill; for instance, in the manufacture of paper and of brass and copper utensils, mats, blinds, fans, etc., all of which are made by hand. It has been said that the country is also well adapted for the culture of silk. The art of pottery has declined among the Koreans who once practiced it with incomparable skill. They taught the secret to the Japanese and for five centuries none of the finer ware has been produced in Corea. Compared to our standard of wages, the rates paid to the Korean workingmen seem very low. They are said to be only fifteen cents in gold per diem for unskilled labor. When the price of rice, which is the staple article of consumption, is at its average, it is quite possible for the Koreans to supply their simple wants at this rate of wages, since it is said that a man can support himself, his wife, and three children for a month on 140 pounds of rice, which formerly was worth \$3.00.

Finance, Currency, Railways, etc.—The main source of revenue is the land tax. The United States Consular Report for June, 1898, states that out of a total revenue of \$4,527,476, \$2,227,758 comes from this source. The tax is collected only from rice fields and lands cultivated for grain, especially from the former, and not from house lots or timber and pasture lands. There is a rough classification of the different kinds of rice land and the taxes are apportioned accordingly. The system of collection is still very primitive, the department of finance relying upon ancient surveys. It is said in a recent report that hundreds of poor people pay taxes on land which has been washed away. Copper coin is the prevailing form of currency in Corea. It is based theoretically on the silver dollar, equal in value to the Japanese yen but not coined at present. As Japanese paper and coin make up a large part of the Korean currency the adoption of the gold standard in Japan virtually placed Corea on a gold basis. The banking facilities are supplied by branches of large Japanese banking houses. In a Consular Report for August, 1898, it is stated that money is seldom loaned for less than 12 per cent. on good security. At Chemulpo there is a branch of the Hong Kong and Shanghai banking corporation and in the spring of 1898 the Russians opened the Russo-Korean Bank at Seoul, but closed it up in about a month on account of the change in the Russian policy toward Corea. Internal communications are still in a backward condition, although improvements

in the making of roads have lately been undertaken in the vicinity of the capital. On the Han river, between Seoul and Chemulpo, there are small steamers owned by Japanese. A railway has been begun by an American syndicate to connect Seoul with Chemulpo, and a French company has obtained a concession for a railway line from Seoul to the Chinese frontier. Telegraph communications are defective but there is a line joining Seoul with Fusan and Chemulpo, and a cable from the latter place to Nagasaki. Corea maintains a postal system.

Education.—Corean children are usually educated at home. A well-to-do family often employs a private tutor and the poorer families in some cases unite and employ a teacher for their children. Boys are instructed in the use of the Chinese characters and in the reading of Chinese classics, but girls are not as a rule taught to read. In 1898 it was reported that the Department of Education had under its direct charge ten schools, including one normal school with a curriculum comprising composition, reading, geography, arithmetic, history and dictation; and nine primary schools teaching the elements of the branches above mentioned and including a course in gymnastic training. There are also 21 local primary schools in the centres of population and to these the Department of Education grants a subsidy. From this it appears that the government work in the field of education is wholly inadequate. The foreign missionaries have done much to make up for this deficiency. The Americans, Japanese, English, French, and Russians have all done excellent educational work.

The American Methodist Church supports a flourishing school at Seoul and receives some assistance from the government. In 1898 it was reported that 176 were in attendance during the previous year. The school authorities aim not only to furnish education, but to supply employment to needy scholars and to teach them a trade. There is another American school at Seoul, and in this the attempt is made to train native teachers. In connection with it the government has founded a school in which the sons of nobles are taught the English language. The government maintains a Japanese language school in which the course of study extends over three years, and there is also a private Japanese school maintained by the Foreign Education Society of Japan. There is a very successful French school in Seoul with an extended and somewhat advanced curriculum. Perhaps the best of all of the foreign language schools, however, is that maintained by the English and opened in 1894. Chinese and Russian teachers have also opened schools in Corea.

Government and History.—Corea is now an independent monarchy, the reigning monarch who assumed the title of Emperor on October 15, 1897, being Heui Yi. His power is somewhat limited by the Cabinet, whose laws and resolutions, however, must be submitted to him for approval. There are eight executive departments, including the Cabinet, the Home Office, the Foreign Office, the Treasury, the War Office, Education, Justice, and Agriculture, Trade and Industry. China exercised suzerian rights over the country until the war with Japan 1894-95. As a result of that war she gave up her suzerainty and acknowledged the complete independence of Corea. For some time afterward the country was in an unsettled state. The Japanese would not leave until certain reforms were carried out by the Corean government, and their evacuation was not complete until October 1896. In that year and the next Russian intrigue was active and resulted in the appointment of a pro-Russian cabinet. Russian aggression was viewed with alarm both by the British and the Japanese. Late in the year 1897 there was a dispute between Great Britain and Russia over the control of the Corean finances. For years an Englishman named McLeavy Brown, in the capacity of superintendent of customs and financial adviser, had done much to improve the financial administration. Through Russian influence he was dismissed and a Russian nominee was chosen in his place. The British government refused to accept his dismissal and at last made a naval demonstration. The two governments reached a compromise by which Corean financial affairs were to be under the joint management of British and Russian customs agents. In the summer of 1898 Japan and Russia came to an agreement in relation to Corea. By this each power recognized the sovereignty and complete independence of the Corean Empire. The text of the protocol as published in the United States Consular Reports of August 1898, is as follows:

"In accordance with the provisions of Article IV of the protocol signed at Moscow on June 9 (May 28), 1896, by Marshal Marquis Yamagata and Prince Lobanow, Secretary of the State, it is hereby agreed by Baron Nissi, His Imperial Japanese Majesty's Minister for Foreign Affairs, and Baron Rosen, Counselor of State, etc., Envoy Extraordinary and Minister Plenipotentiary of the Emperor of all the Russias, having been duly authorized thereto by their respective governments.

"I. That the governments of Japan and Russia, recognizing the sovereignty and complete independence of Corea, shall in no way directly interfere with the domestic government of that country.

"II. That in order to avoid misunderstandings in the future, whenever either Japan or Russia is applied to by Corea for advice or assistance, neither contracting party

shall take any steps toward the appointment of military instructors or financial advisers without previous consultation with the other.

"III. That Russia, recognizing the great progress made in commercial and industrial enterprises by Japan in Corea, and the great number of Japanese subjects residing in the settlements, will do nothing to injure the development of the commercial and industrial relations between Japan and Corea."

CORINTH. See **ARCHÆOLOGY** (paragraph Greece).

CORN. The following table published by the department of Agriculture shows the acreage, production and value of corn in the United States in 1898.

States and Territories.	Area. Acres.	Production. Bushels.	Value.
Maine	10,893	435,720	\$209,146
New Hampshire	23,823	976,743	449,302
Vermont	46,142	1,984,106	873,007
Massachusetts	39,091	1,563,640	766,184

CORNELL UNIVERSITY, at Ithaca, New York, was incorporated in April 1865, and opened in October 1868. It is non-sectarian and co-educational. President, Jacob Gould Schurman, Sc. D., LL. D. The officers of instruction number 281. The departments of the university, with the student enrollment for 1898-99, are as follows: Graduate department, 173; academic department, 616; college of law, 162; college of agriculture, 74; State college of veterinary medicine, 23; college of archi-

lecture, 45; college of civil engineering, 186; Sibley college of mechanical engineering, 492; the medical college, 274; State college of forestry, 3; total, deducting for 10 names counted twice, 2,038. The following degrees were conferred in June 1898: A. B., 42; Ph. B., 44; B. L., 3; B. S., 57; B. S. in Agr., 9; V. S., 4; B. Arch., 9; C. E., 15; M. E., 87; LL. B., 105; M. A., 10; M. S., in Agr., 5; M. C. E., 3; M. M. E., 2; LL. M., 5; Ph. D., 23. Only the degree A. B. will be conferred upon students of the academic department entering in or after 1897; and hereafter in place of the degrees, A. M., Ph. M., M. L., and Sc. M., the one degree, A. M., will be conferred, and in place of the degrees Ph. D. and Sc. D., the one degree Ph. D. will be conferred.

In 1898 the value of buildings and grounds was \$1,796,372 and of apparatus \$1,135,308; total funds, \$6,446,818; gifts, \$197,126; total income, \$583,050. The year 1898 was the most prosperous in the history of the university, having seen the completion of a hydraulic laboratory, the enlargement of two buildings, the endowment of an infirmary, the establishment of the New York State College of Forestry, with 30,000 acres of forest in the Adirondacks, under the administration of the university, and the establishment of the Cornell University Medical College. The medical staff is composed of ex-members of the staff of two other medical institutions of New York City. The course is four years in length, the first two of which may be taken by men students at either Ithaca or New York, but must be taken by women students at Ithaca; while the last two years must be taken by all students at New York. During the year 1898-99 the medical college has occupied a building in the grounds of Bellevue Hospital, New York; the permanent site will be on First avenue, between Twenty-seventh and Twenty-eighth streets.

Among the prominent appointments in the university faculty were those of Charles De Garmo to the professorship of the science and art of education, and of Austin Flint as professor of physiology. See PSYCHOLOGY, EXPERIMENTAL, and UNIVERSITIES AND COLLEGES.

CORONIUM. Concerning the new element coronium little is yet known. It occurs only, so far as known, in the atmosphere surrounding the sun and possibly near volcanoes. It is revealed by the spectroscope. It is supposed to be much lighter than hydrogen.

COSTA RICA, a republic of Central America, has an estimated area of 23,000 square miles and an estimated population of 268,000. Very few inhabitants of the rural districts are of pure Spanish descent. The pure Indian population numbers about 3,500. The annual immigration since 1894 has been 1,000; it is encouraged by the government. The capital is San José (pop. 25,000); other towns of importance are Heredia, Limón, Puntarenas, Alajuela, Cartago. The state religion is Roman Catholic, but there is complete religious toleration. Education is free and compulsory, and, unlike some of the Spanish-American countries, the government enforces the compulsory law. In 1897, besides five schools for higher education, there were reported 327 primary schools with an attendance of 21,913 pupils.

Government.—Costa Rica became independent in 1821. By the present constitution the executive authority is vested in a President elected for four years by electors chosen by popular vote (legal voters must be self-supporting). He is assisted by a Cabinet of four members presiding over the departments of the Interior, Finance and Commerce; Foreign Affairs, Education, Justice, and Worship; War and Marine. The President, reelected in November 1897, and inaugurated in June 1898, was Don Rafael Yglesias. The legislative power devolves upon a Chamber of Representatives who are elected in the same manner as the President for four years, and in a proportion of one representative to each 8,000 inhabitants. The number of representatives in 1895 was 32. Besides inferior courts and local justices, there are the Court of Cassation, two Courts of Appeal, and the Supreme Court of Justice. Men between 18 and 50 years of age are liable to military service. The army in time of peace numbers 600, with a national guard of 12,000, which, it is said, if need be can be increased to 34,000.

Finance.—Revenues and expenditures in pesos for fiscal years have been reported as follows:

	1895.	1896.	1897.
Revenue.....	6,123,872	6,528,975	7,435,611
Expenditure.....	6,121,493	6,187,927	6,697,327

The foreign public debt amounts to about \$9,740,000; of this the interest on \$7,173,250 is 2½ per cent. and on \$2,556,750 is 3 per cent. In 1897 the internal debt amounted to about \$1,095,750. The redemption of this amount is progressing rapidly. Costa Rica has two banks, with a capital of 1,200,000 and 2,000,000 pesos. Circulating paper in 1896 amounted to 3,300,000 pesos and the silver to 350,000 pesos. The silver peso at par is worth about \$0.975; the value of the paper peso is about \$0.45. In October 1896, the government adopted the gold standard and fixed the gold *colón* as the monetary unit, its value being \$0.465.

Industries and Commerce.—Agriculture is the principal occupation of the people, and coffee and bananas are the chief products. The soil is very fertile and almost any crop can be cultivated profitably. Attention is also paid to the raising of cattle. Parts of the country possess valuable gold and silver mines, but these at present are little worked. Coffee is the chief export, amounting in 1896 to over 197,000 bags, valued at 10,178,040 pesos. Other exports are cabinet woods and hides and skins. The principal imports are cotton, woolens, and iron goods. Imports and exports have been valued in paper pesos as follows:

	1894.	1895.	1896.
Exports	10,165,201	13,250,000	
Imports	12,183,609	12,218,550	12,153,592

The following statistics comparing the amount of exports from Port Limón and from Puntarenas during the first six months of 1897 and the corresponding period of 1898 are derived from the Director-General of Statistics at San José:

	1897. Kilos.	1898. Kilos.
Port Limón:		
Miscellaneous exports	152,386	184,710
Coffee, in parchment	1,794,874	4,428,149
Coffee, cleaned	10,139,879	11,168,992
Bananas	27,400,966	34,414,609
Reshipments	1,928	136,788
Total	39,490,033	50,333,248
Puntarenas:		
Miscellaneous exports	3,564,113	2,761,124
Coffee, in parchment		16,577
Coffee, cleaned	1,653,544	1,870,280
Bananas		
Reshipments	14,178	15,751
Total	5,231,835	4,663,732

An Important Mining Concession.—On February 23, 1898, the contract between the Ministry of the Treasury and the Abangeres Mining Syndicate (Limited) was approved by the Costa Rican Congress. The corporation, which agrees to open up the Abangeres mining region in the province of Guancaste, was given a fifty years' exemption from all federal taxation, except in cases otherwise provided for in the contract, and an exemption during the same time from import tariffs on such machinery and other commodities as may be necessary for furthering the enterprise. The company, however, is not exempt from the payment of general municipal taxes. According to the contract the government is to receive from the company one per cent. on the gross output of the mines during the first twenty-five years, and two per cent. during the remaining twenty-five. The company may construct such wharves, railways, telegraph and telephone lines, etc., as it may consider to be necessary, but it must transport free of charge over its railways public officials and, in case hostilities should arise, munitions of war; its wharves also may be used by the government free of charge and it must transmit official despatches over its telegraph and telephone lines without remuneration. The company agreed to invest not less than £50,000 in Costa Rica, and the investment is transferable to any persons or companies with the exception of foreign governments and their representatives. The fifty years' contract began on the day of its approval by the Congress, but provision was made that it should lapse should the company not begin operations within the six months following, or having begun should suspend the work for three consecutive years, or should the percentage tax fail of payment by the company. A \$10,000 (Costa Rican currency) guarantee of good faith was given to the government by the company.

Shipping and Communications.—In 1896 there entered Limón and Puntarenas 476 vessels of 421,125 tons, and cleared 475 of 473,929 tons. These vessels were chiefly British, German, and American (U. S.). The merchant marine in 1895 consisted of two steamers of 244 tons and 2 sailing vessels of 541 tons. There are two railways. One extends from Port Limón through San José to Alajuela, a distance of 117 miles; the other, 14 miles in length, connects Puntarenas with Esparta. A line uniting the latter town with Alajuela, thus completing rail communication between the two coasts, is under construction, and other roads have been projected. In 1897 the telegraph lines aggregated 878 miles with 43 offices; the post-offices numbered 81.

Government Steamship Contract.—In September 1898, it was announced that a contract had been formed between the government of Costa Rica and the Pacific Steam Navigation Company and the Compania Sud Americana de Vapores (South American Steamship Company). The contract provided that steamers of both companies plying between Valparaiso, Chile, and Ocos, Guatemala, should touch on both north and south bound trips, at least twice a month, at Puntarenas or at Tivives, as soon as the latter port should be opened; these steamers should afford facilities for handling passengers, mail and freight, and should carry without cost to the government Costa Rican mail matter which would naturally pass through the various destinations of the steamers, and they should also handle the Costa Rican mail from these ports. Immigrant laborers, artisans, etc., when under agreement with the government, should be carried by the companies at fifty per cent. of the regular rates, and government freight to or from Puntarenas or Tivives and between Panama and Ocos should be carried at a twenty-five per cent. reduction. Without authorization by the government the companies were not to carry troops or ammunition to any Costa Rican port, and the steamers were always to recognize such quarantine laws as might be established. In return for these considerations the government made the following concessions. The companies were to receive an annual subsidy of \$5,000 (Costa Rican money), which amount would be increased to \$7,500 in case the steamers should touch at Puntarenas or Tivives weekly. The steamers were exempted from all taxation except light house duty, which should not exceed an annual tax of \$100, and they should be subject to the existing marine laws of the government, excepting those suspended by the contract. The contract was to stand for two years and in case neither party announced three months previous to its expiration a desire to bring the contract to an end, it should stand for two years more. All differences which might arise between the government and the companies should be settled by arbitration.

The President's Message.—At the opening of the regular session of the National Congress May 1, 1898, President Yglesias transmitted a message briefly summing up the general condition of the fiscal year ending April 30. He congratulated the country on the successful termination of the recent troubles with Nicaragua, and expressed his gratification with the patriotism and spirit of unity which was manifest when war was imminent. The just criticism is frequently brought against Spanish speaking countries that the general population is in a state of lamentable ignorance; but with regard to education the President's report was encouraging. Among the statistics that he gave we would note that in 1893 there were 280 schools, but in 1898 there were 388, while the attendance in 1893 averaged 17,517, but in 1898 it averaged 23,134. In the former year there were 167 school buildings, in the latter there were 259, while 31 were being constructed and 78 more had been planned; during this time, moreover, the number of teachers had been increased by 332. School property, provided both by private subscription and by governmental appropriations, was valued at considerably more than \$1,000,000. President Yglesias also briefly reported the satisfactory condition of the treasury. During the fiscal year 1897-98, he said the public revenues aggregated \$8,424,104, an amount which exceeded the estimates by \$320,172 and the revenues of the previous year by \$936,935; the expenditures left a surplus of \$108,650. The government firmly believed in the gold standard and had a gold deposit of \$1,000,000, while the credit of the country both at home and abroad was good. The President reported that the Pacific Railway was the most important of the public works under construction. He said that the 1,000 to 1,200 men at work upon it were rapidly building the road, the first fifteen miles of which were at that time ready for the rails, and that he expected the road would be put in operation in 1899 between Limón on the Atlantic and Tivives on the Pacific coast. Among the other public works that were in process of construction were the National School of Correction, several wagon roads, and various sanitary improvements at Port Limón together with harbor improvements. See the article CENTRAL AMERICA.

COTTON AND THE COTTON INDUSTRY.* The commercial crop of cotton for the season of 1897-98 (ending Aug. 31, 1898), was 11,215,953 bales, averaging 507 pounds (gross weight) per bale, against a crop of 8,705,802 bales, averaging 502 pounds per bale (gross weight) for the previous season. The average price of Middling Upland Cotton in New York for the season was about 6¼ cents per pound, being 1⅜ cents less than the previous season. Mr. Thomas Ellison, of Liverpool, estimates British consumption for the season ending September 30, as 3,380,000 bales (of 500 pounds net), being 156,000 bales more than the previous season, and continental consumption as 4,576,000 bales of 500 pounds net (exclusive of about 250,000 bales of Asiatic cotton spun in Russia), being 208,000 bales more than the previous season. United States consumption for season ending August 31, is estimated as

*Summarized from *Cotton Facts* by A. B. Shepperson. Edition Dec., 1898.

2,922,000 bales (of 500 pounds net), being 205,000 bales more than last season. The Northern mills consumed about the same quantity as during the previous season, while the Southern mills consumed about 205,000 bales more. The "takings" (orders placed) of the American spinners from the crop were 3,465,000 (running) bales, exclusive of 114,000 bales sent to Canada; but the stocks of cotton held by the Northern mills at the end of the season were probably 375,000 bales more than at its commencement, and by Southern mills 37,000 more, making a total increase in United States mill stocks of 412,000 bales. This does not include 63,357 bales of Egyptian and 20,608 bales of Peruvian cotton imported during the season. The Peruvian cotton has been used, as heretofore, entirely in the manufacture of adulterated wool goods. In our exports of cotton during the season were 36,429 bales to Mexico, 211,104 bales to Japan, 13,562 bales to China, and 300 bales to India. The exports of the previous season to Mexico were 30,290 bales, and to Japan 61,456 bales. The takings of cotton for the season by the spinners of the United States were 673,000 bales more than in 1896-97; 960,000 bales more than in 1895-96; 594,000 bales more than in 1894-95; 1,174,000 bales more than in 1893-94. European spinners have taken 638,000 bales more than in 1896-97; 1,011,000 bales more than in 1895-96; 623,000 bales more than in 1894-95; 849,000 bales more than in 1893-94. European as well as American spinners have not only bought more, but have consumed more cotton than in any previous season. The cotton mills of India consumed, during the year ending June 30, 1,481,000 bales (of 392 pounds), being 180,000 bales more than the previous year. The cotton consuming countries of the world, from which reliable statistics are obtainable, have consumed 710,000 bales (of 500 pounds net) more than during the previous season—Europe showing an increase of 364,000 bales; the United States an increase of 205,000 bales, and India an increase of 141,000 bales. The stocks of cotton in the British mills on September 30, are estimated by Mr. Thomas Ellison of Liverpool as 108,000 bales (of 500 pounds net), being 77,000 bales more than on September 30, 1897, and at the Continental mills 493,000 bales, being 310,000 bales more than on the same date in 1897. The number of spindles in operation in Great Britain is estimated as the same as the previous season, while there was an increase of 1,030,000 spindles on the continent and 300,000 in the United States, the increase in this country being in the Southern States. While the consumption of cotton in the Northern mills was practically the same as the previous season, the consumption of the Southern mills increased nearly 22 per cent. Cotton goods have never been so low in this country. The chief cause of the low prices was the weight upon the markets of the immense accumulation of stocks of nearly every description of domestic cotton goods. The large stocks were due to the fact that the capacity of our cotton mills has increased so much faster than our population that the home demand is not equal to the production, and that we have practically no foreign outlet for our surplus of goods and yarns. During the year ending June 30, we exported 270,507,818 yards of cotton goods against 313,533,044 yards for previous fiscal year, a falling off in quantity of 14 per cent. The value of our exports of cotton manufactures of all kinds for year ending June 30 was \$17,024,092 (including \$23,878 to Cuba, \$3,884 to Porto Rico, \$361,379 to Hawaii, and \$1,304 to the Philippines), against \$21,037,678 the previous year, showing a falling off of 20 per cent. Great Britain's exports of cotton goods and yarns for year ending August 31 were equal to 6,313,140,500 yards of goods, valued at \$272,186,030. Though we furnish about 80 per cent. of the cotton used by the cotton mills of the world, the quantity of our exports of cotton manufactures is only $4\frac{1}{3}$ per cent. of those of Great Britain. The effect of our high tariff is to deprive us of export trade in cotton manufactures except for a limited quantity of goods, chiefly those in which the cotton itself contributes the largest proportion of the cost. The duty on machinery makes it cost fifty per cent. more than for a similar mill in England, thus requiring a larger capitalization and greater profits in order to pay dividends on the larger capital. Our mills are thus handicapped at the outset, but the duties on chemicals, acids, dyes, and everything which enters into the manufacture of bleached, colored or printed goods prevent our competing successfully with England even for the trade of such nearby countries as Mexico, the West Indies, Central and South America. If the tariff bars were let down so that the cost of the machinery to equip our mills and the cost of all the foreign articles needed for the various processes of manufacture should be no greater than in England, then our Northern and Southern mills alike would be able to build up a large foreign trade. There would then be no over-production with the inevitable result of reductions in the prices of goods and the wages of operatives, and our cotton manufacturing industry would increase and prosper as never before.

The following table prepared by Mr. A. B. Shepperson is a statement of the United States cotton crop and exports, and the annual takings (orders placed), of United States spinners from 1880 to August 31, 1898. This table gives the total commercial crop destination of export, amount of takings of Northern and Southern mills and the percentage of the American crop taken by American mills:

Statement of United States cotton crops and exports, and the annual takings (orders placed) of United States spinners since 1880 (in thousands of bales).

SEASON.	Total Commercial Crop.	EXPORTS. Exclusive of Railroad Shipments to Canada.			TAKEN FOR HOME CONSUMPTION. (Canadian Mills not included.)		Percentage of Crop Taken by U. S. Mills.

The cotton acreage of Egypt from 1890 to 1898 has been as follows: In 1890-91, 888,000 acres; in 1891-92, 863,000 acres; in 1892-93, 950,000 acres; in 1893-94, 1,050,000 acres; in 1895-96, 1,250,000 acres; in 1896-97, 1,300,000 acres; in 1897-98, 1,350,000 acres. In 1898-99, 1,450,000 acres were reported.

The total cotton shipments in thousands of bales, from Alexandria, Egypt, for the seasons of 1895-96, 1896-97 and 1897-98, and the shipments to Great Britain and the continent for the same periods, are given in the accompanying table:

Egyptian crop. Shipments from Alexandria (in thousands of bales). (A. B. Shepperson.)

Season of 1895-96.

To Great Britain (including 59,339 for United States and 5,359 to Bombay and Japan	405
To the continent	279

Total shipments 751

Season of 1897-98.

To Great Britain (including 54,979 for United States; 6,089 to Bombay and Japan)	411
To the continent	432
Total shipments	843

The crop of "rough Peruvian" cotton varies from 25,000 to 50,000 bales, and the greater part of it goes first to Great Britain. It is put up in bales of about 175 pounds.

The annual importations of Peruvian cotton into the United States have been as follows:

1887-88	4,279 bales
1888-89	7,650 bales
1889-90	9,500 bales
1890-91	10,515 bales
1891-92	13,000 bales
1892-93	24,000 bales
1893-94	19,000 bales
1894-95	24,000 bales
1895-96	24,603 bales
1896-97	16,604 bales
1897-98	20,608 bales

During the periods named in the following table (1897 and 1898) cotton goods of domestic manufacture have been shipped as indicated:

Quantities and values of annual exports from the United States of cotton goods of domestic manufacture, by countries, 1897 and 1898. (Compiled from reports of U. S. Treasury Department). (A. B. Shepperson.)

Cotton Manufacture in Japan and China.—In discussing this subject Mr. A. B. Shepperson says: While cotton is universally used by the Japanese for clothing, and has been spun and woven by them on hand-machines for centuries, the factory system of spinning and weaving with machinery driven by steam and water power was not adopted to any considerable extent until 1889, when about 200,000 spindles were in operation.

Since then the progress of the industry has been so rapid that it is thought two-thirds of the Japanese spindles now at work can supply all the yarn needed for home consumption, while the product of one-third of the spindles is seeking foreign markets in the East (notably in China), in sharp competition with England and India. Reliable advices state that on Aug. 1, 1898, there were in operation in Japan 76 mills with 1,086,082 spindles and 2,900 looms, while 3 mills and 223,954 spindles were being erected.

The official *Résumé Statistique de L'Empire du Japon*, published at Tokio in 1897, gives the following statistics of cotton mills for 1890 to 1895:

Year ending Dec. 31.	Number of Spindles.	Cotton Consum- ed (Sales of 500 lbs. net).	Yarn Produced (Pounds).	Number of Operatives. (Males.)	Number of Operatives. (Females.)	Average Daily Wages of Males. (Sen.)	Average Daily Wages of Females. (Sen.)
1890.....	377,886	99,375	42,771,568	4,089	10,880	17.	9.2
1891.....	358,980	149,621	64,082,817	5,061	14,318	17.7	9.
1892.....	366,214	304,018	81,084,815	6,264	18,678	17.4	9.6
1893.....	381,781	192,186	89,667,286	6,164	19,284	17.4	9.4
1894.....	580,074	288,221	121,868,400	6,129	20,289	17.1	9.9
1895.....	580,945	362,666	153,426,788	9,660	31,140	18.	9.9

The consumption of 1897 was 42 per cent. greater than in 1895.

In May, 1898, the average daily wages paid by the mills were 24.71 sen (equal to about 12.35 cents United States money) for male and 14.71 sen (or about 7.35 cents) for female operatives, being an advance of about 37 per cent. for males and 50 per cent. for females since 1895.

The consumption of cotton by the mills during year ending December 31, 1897, was as follows:

East Indian cotton....	161,680,866	pounds; equal to	323,362	bales of 500 lbs net
Chinese cotton	45,089,800	"	90,179	"
American cotton	43,162,192	"	86,324	"
Anam and Saigon cotton	5,881,817	"	11,764	"
Egyptian cotton	1,411,058	"	2,822	"
Japanese cotton	1,068,383	"	2,137	"
Other kinds of cotton..	117,158	"	234	"
Total consumption...			516,822	

The Japanese sen is worth one cent in silver and at the present value of silver is equal to about one-half of a cent in United States money. The mills run 22 hours each day, and there are two sets of operatives—one for day and the other for night work—each set of operatives working 11 hours per day.

The largely increased purchases of American cotton by the Japanese of recent years is an indication that their mills are making a larger proportion of higher grades of yarn than formerly. It also shows that they are quick to appreciate the fact that, at the low prices of the past year, American cotton is really the best and cheapest in the world for the great majority of spinners to use.

Since 1893 the annual exports of cotton from the United States to Japan for years ending August 31, have been as follows:

1893-94	6,668	bales
1894-95	18,750	bales
1895-96	39,211	bales
1896-97	61,456	bales
1897-98	211,104	bales

The present production of cotton in China is probably equivalent to about 1,300,000 bales of 500 pounds net. The cotton which is not retained in the interior to be spun there is usually shipped "unginned" (or just as it is picked from the plants) to the ports, where it is ginned and packed into bales of about 500 pounds. During year ending August 31 last, 13,562 bales of American cotton were shipped from United States to Chinese mills, doubtless for mixing with Chinese cotton.

COULDOCK, CHARLES WALTER, actor, died in New York November 27, 1898. He was born in London, England, in 1815; went on the stage at the age of twenty-one and his early experiences were attended with much hardship. He gained a place in his profession, however, and played with many stars, including Kean, Macready, Buckstone, Charles Matthews, Charlotte Cushman and Mme. Vestris. His first appearance in America was in New York, in 1849; afterwards he played with Mr. Joseph Jefferson and the late E. A. Sothern. Among his rôles may be mentioned "Jacques," "Cardinal Wolsey," "King Lear," "Othello," and "Macbeth," but his rôle best known to younger Americans was that of the old miller in *Hazel Kirk*. He appeared in this character 1,500 times, the first time being in 1879 and the last at the Star theatre, New York, in September 1898.

COUNCIL OF JEWISH WOMEN, organized in 1893 for the study of Jewish history, religion, and literature, has 4,500 members. Its headquarters are Chicago. President, Hannah P. Solomon; secretary, Sadie American, 3,130 Vernon avenue, Chicago, Ill.

CRAMER, Rev. MICHAEL JOHN, D. D., educator and diplomat, died at Carlisle, Pennsylvania, January 23, 1898. He was born at Schaffhausen, Switzerland, in 1835, was graduated at the Ohio Wesleyan University 1860, and having entered the Methodist ministry, was a chaplain in the United States army 1864-67. He married in 1863 Mary F., sister to Gen. U. S. Grant. Under President Johnson he was Consul at Leipsic; President Grant appointed him Minister to Denmark, and under President Garfield he was *Chargé d'Affaires* to Switzerland. He was professor of systematic theology at Boston University 1885-87; he wrote for theological periodicals and in 1889 became associate editor of the *Theological Quarterly Review*; for a year he was professor of church history at Drew Seminary, Madison, New Jersey, and late in 1897 was elected to the chair of philosophy at Dickinson College, Carlisle, Pennsylvania.

CREMATION OF THE DEAD. This means of disposing of the dead is slowly increasing in favor in Europe and America. Crematories are reported in the United States at Boston, Buffalo, Fresh Pond, N. Y., Lancaster, Philadelphia, Detroit, Davenport, St. Louis and Los Angeles. The crematory at Fresh Pond is

owned by the United States Cremation Company, of New York City. From December 4, 1885, to the close of 1889, 2,900 bodies were burned at Fresh Pond. The birthplaces of the decedents were as follows: Germany, 1,492; United States, 984; England, 94; Switzerland, 66; Austria, 54; France, 45; Ireland, 22; scattering, 133. The division by sex is: Males, 2,065; females, 935. The Cremation Society of England, started in 1874, had burned over 1,000 bodies at Woking up to the end of 1897, the number in 1897 being 173, as compared with 137 in 1896. Crematories owned by municipalities are unknown in the United States, but are reported as in existence at Rome, Milan, Florence, Venice, Leghorn, Rouen, and Gotha, while at Prague, Bohemia, there is one owned by the general government.

CREMATION OF GARBAGE. See GARBAGE.

CRESPO, JOAQUIN, ex-President of Venezuela and General-in-Chief of the army, was killed in an engagement with insurgents April 17, 1898. He was of mixed Spanish and Indian blood and was born at San Francisco, Miranda, August 22, 1841. In early life he joined the Federalist party and took part in the various internal disturbances of his country. He first came into prominence as a soldier in 1871, when he won the battle of Cano Amarillo, thus turning the tide of victory in favor of the revolutionists. In 1879 Crespo brought Guzman Blanco's revolution to a successful termination at the battle of El Zamuro, and he became governor of the state of Guarico, and in 1884-86 was president of the republic. Blanco succeeded him and in 1888 turned the office over to Dr. Rojas Paul, whereupon Crespo attempted to bring about a revolution, but was unsuccessful and fled to Peru, going in 1889 to Washington, D. C. When in 1892 President R. Andueza Palacio proclaimed himself dictator, Crespo raised an army, defeated Palacio on October 10, and proclaimed himself provisional President. About two weeks later this government was recognized by the American minister and Crespo became President; under him the government was reorganized. He was reelected in 1894; he was succeeded by his friend, General Ignacio Andrade, who was elected in September 1897, defeating Rojas Paul and General Hernandez. Crespo became governor of the state of Miranda. A rebellion was headed by Hernandez and it was in overcoming this that Crespo was killed. General Crespo was a man of intelligence and ability, "rather above the usual type of South American revolutionists," and his loss was keenly felt by his government. See VENEZUELA.

CRETE, one of the largest islands of the Mediterranean, lying to the south of the Egean Sea at the entrance of the archipelago, with a population, according to estimates based on the census of 1885, of 294,192, but later estimates place it at 370,000, comprising about 300,000 Christians and 70,000 Moslems. The principal cities are Candia (pop. 25,000), Canea, or Khandia (pop. 15,000), and Retimo (pop. 9,000).

The Political Situation.—The administration of government in Crete in 1897 was a crying question and during 1898 continued to present many perplexing difficulties. Just before the outbreak of the Græco-Turkish war the powers were about to establish an autonomous government in Crete under the nominal sovereignty of the Sultan. They promised that the Turkish troops should evacuate the island and that the Porte should not interfere in the administration of Cretan internal affairs. When the war was ended, Turkey having been overwhelmingly victorious, the attitude of the powers changed. The autonomous government was not put into operation; the fifteen thousand Turkish regulars did not withdraw, nor did the thousands of bashi-bazouks, those cruel Moslem desperadoes, who, while receiving no pay, get their sustenance from the government, and for whose acts the Porte denies its responsibility; and Djevad Pasha, who immediately began intrigues, was appointed Military Governor. Murder and outrage, committed largely by the bashi-bazouks, continued. The powers still had land and naval forces in the island, and in September 1897, the Porte requested that these withdraw, and almost at the same time the revolutionary government asked that the Turkish forces leave, repeating its willingness to accept the previously proposed plan of autonomy. The forces of the powers remained, but no satisfactory answer was given to the Cretan Christians. The European ambassadors at Constantinople, under the advice of the admirals, were occupied at this time in attempting to fix upon a governor for Crete who would be fair in the administration of government and still be acceptable to the Sultan. Various names were suggested only to be rejected; among them were Franz Joseph, of Battenberg; Colonel Schaeffer of Luxembourg; M. Numa Droze, ex-President of the Swiss Republic; and M. Petrovich, a relative of the Prince of Montenegro. Government in the meantime was being administered as well as possible by the foreign admirals, but on account of the attitude of the Porte their position was precarious, and plundering, looting, and even murder was continued by the bashi-bazouks. It is said that the condition of the native Christians in the interior of the island was pitiful during the winter of '97-98. In the early part of the year Prince George, of Greece, was proposed for Military Governor. His cause was advocated most zealously by the Czar and

protested against with equal vigor by the Sultan. In the first week in February it was announced that the governorship and the Cretan question generally had been postponed for the time, and a few days later it was learned that even Russia had abandoned the candidacy of Prince George, but would not allow an increase in the number of Turkish troops in Crete, or be a party to any coercion of the Cretans. The attention of the powers was now taken from Cretan affairs by reason of the international complications in the Far East and the impending war between the United States and Spain. Germany and Austria withdrew their forces from the island, leaving matters in charge of the British, Russian, French, and Italian admirals. Fearing further outbreaks, they began reform measures, endeavoring to institute temporary laws. They retained seaports for their own administration, but gave the interior over to the control of the Christians, directing that six administrators be elected by the Cretan Assembly. This was not autonomy, but the Cretans, grateful for any relief, accepted unconditionally the new form of government, July 25, 1898. The administrators submitted a new set of laws to the admirals, who approved them, and the new administration began; but as soon as a Christian was given a position in the Custom House, the Turks became enraged.

Violent Outbreaks.—The bitterness increased until September 6, when it culminated in Candia in a Moslem attack on the Christians and on the British troops; on that day a crowd of unarmed Moslems tried to force their way into the revenue office, and in repelling them the British troops found it necessary to open fire. The Turks dispersed, but only to get their arms, and returning they attacked the British soldiers, killing seventeen and wounding fifty, and then began generally to loot and pillage and to murder the Christians. About seven hundred Christians were massacred, the British, German, and Spanish Consulates were plundered and wrecked, and the British Consul was burned to death in his own house. A bombardment of the city by the British and other warships in the harbor ensued, and considerable damage was done. Edhem Pasha, who was then the Turkish Governor, claimed that he was unable to quell the outbreak, but it was thought that he himself was responsible for it and connived at it, having had, it was said, warning that the massacre was being planned. Furthermore some of the Turkish regular troops took part in the affair. The British admiral had made two demands of the Porte: the one that Edhem Pasha turn over to him the leaders of the insurrection; the other that the bashi-bazouks be disarmed. The first demand was easily complied with, Edhem Pasha surrendering about forty men to the admiral. It was thought, however, that these were not the real leaders at all, but were more probably criminals whom the wily Turk palmed off in this way. The second demand greatly disturbed the Sultan and Turkish officials both in Constantinople and in Crete. Edhem Pasha begged the admiral for more time, and the Sultan sent imploring messages to the various ambassadors urging their support against the demand. The situation became worse and fighting was resumed; the Christians gathered around Candia waiting for opportunities to avenge themselves on the Turks. Admiral Noel remained firm, setting a time for a second bombardment if the Turkish government would not disarm the bashi-bazouks. Finally the Sultan telegraphed that the ultimatum would be complied with.

The Withdrawal of the Turkish Troops.—The situation was still very grave, for the new Cretan government realized its inability to maintain peace and order while a Turkish army with its intriguing leaders remained in the island. It was suggested that an ultimatum from the powers force the Sultan to withdraw his troops, and that British and Italian garrisons be substituted.

Prince George Chosen Governor.—In November 1898, the four powers were maintaining on the island about 16,000 troops, about one-half of whom were British, and were trying to carry out their agreement to protect the Mussulmans. Nevertheless many of the latter were leaving the island. On November 26, it was announced that Prince George of Greece was to be the High Commissioner in Crete for the four powers, the latter having agreed upon his nomination. He assumed the duties of his office on December 21. While acknowledging the suzerainty of the Sultan, he was to organize an autonomous government in coöperation with the general assembly, guaranteeing freedom of religion, and security of life and property, and establishing a gendarmerie. To aid in defraying expenses of administration, each of the four protecting powers agreed to advance the sum of \$200,000, which should afterwards be repaid by the Cretan government.

CRIME. The objects of a statistical investigation of crime are perhaps too obvious to need explanation. Their immediate purpose is of course to ascertain the effect of criminal legislation. As Lord Brougham said in 1860, "Criminal statistics are for the legislator what the chart and the compass are for the navigator." Secondly, an even more important object of this study is to ascertain the real nature of the social phenomenon called crime, its extent, its increase or decrease, and the influences which determine it. There are seri-

ous obstacles in the way of such investigations, especially when they aim to compare the extent of the criminality of one country with that of another. The chief of these obstacles is the difference between the laws in the different countries together with the differing degrees of administrative efficiency which give the criminal a greater or less chance of acquittal. Moreover the official methods of classification of crime vary, and crimes which appear under one name in one country are classified differently in another. Nevertheless these investigations have on the whole proved fruitful. Their aim is to show the influences of external physical conditions such as climate, geographical situation, nationality, seasons and months, or the influence of social and economic conditions, such as the scarcity of food, commercial crises, religious confession, etc., or the influence of subjective and biological conditions including the organic constitution of the criminal, his mental constitution and his personal characteristics. In the investigation of the last named influences very effective work has been done in recent years by such writers as Lombroso, Ferri, and Beltrani-Scalia. These writers and others of the so-called experimental or positive school, lay great stress on the anthropological factors of criminality, although they hold that crime is a product equally of physical and social conditions. They think it erroneous to argue that crime is nothing but a social phenomenon with which the abnormalities of the individual, whether physical or psychical, have nothing to do. Crime cannot be understood, they say, except by a study of all the factors entering into the production of the criminal type.

Regularity of Crime.—The most remarkable feature of criminal statistics is the proof which they afford of the regularity in the number of crimes. This regularity was first presented in its most striking form by the great Belgian statistician Quetelet, who said that there is a budget paid with greater regularity than that of any finance minister, namely, the budget of the prison, the galleys and the scaffold. Later investigations have borne out this general statement, although they show considerable fluctuation in the number of crimes. This regularity is far more conspicuous in the case of the more serious crimes than in that of the minor offenses. The Italian criminal sociologist, Professor Ferri, considers the most striking fact brought to light by statistical investigations to be the "steadiness of the gravest form of crime side by side with the continuous increase of slighter offenses." But while crime increases in the aggregate, there are oscillations from year to year. Professor Ferri has put forth an interesting theory which he calls the "Law of Criminal Saturation," by which he means that just as a certain quantity of chemical substance and not an atom more or less can be held in solution at a given temperature in a given volume of water, so there is always a fixed number of crimes in a given social environment under certain defined physical conditions of the individual. Statistics show that variations in the environments result in variations, more or less proportionate, in crime. Thus it has been observed that crimes against the person in France have varied but little during a period of sixty-two years, and where the variations have been at all marked they have been in years of political excitement or intense heat, or otherwise exceptional years; while on the other hand the crimes against property have fluctuated from year to year with economic conditions. Professor Ferri says that this regularity was so marked, that in tracing the movement of criminality he was able to guess at the existence of some crisis or other disturbing cause during the year. By statistics alone he could in a measure trace the history of the country. The effect of economic conditions is sometimes rather surprising. Thus in times of famine it was observed by Professor Ferri that a certain class of crimes increased while another class diminished. His investigation of the matter showed that slight offenses which were sufficient to land the offender in prison were resorted to in order to secure maintenance at the public expense, while other classes of crimes diminished contrary to our natural supposition, that a time of hardship and scarcity is accompanied by a general increase of violence of all kinds.

One of the conclusions which he draws from this law of criminal saturation is that the belief in a mechanical regularity in crimes is to some degree unfounded and he revises the statement of Quetelet's that the budget of crime is an annual taxation paid with more preciseness than any other, by an appeal to statistics, covering a longer period of time than those of Quetelet who limited his inquiry to the more serious crimes and to a comparatively short succession of years. Another consequence of his so-called law is that penalties which have hitherto been regarded as the best remedies for crime are not so effectual as they are thought to be, since crimes increase and diminish as the result of a great variety of other causes. Familiar instances of such a movement of crime quite apart from repressive legislation, are afforded by the history of the declining Roman Empire, especially as regards the severe penalties imposed for serious crimes and the attempt to crush out Christianity with punishments and tortures; and again by the history of Catholic Europe in its struggle to uproot Protestantism by persecution. The view, however, that the repression of

crime is not measured by the severity of punishment is so old and well established that it hardly needs corroboration.

Increase of Crime.—While an international comparison of criminality is impossible on account of the differences in the criminal law, administrative efficiency, and official classification in the different countries, some idea of the relative frequency of crimes in the principal civilized countries can be had by a study of recent statistics. In Great Britain and Ireland the figures for a long term of years seem to show that serious crime is on the decrease, not only relatively but absolutely. According to Professor Mayo-Smith, it sank from 522 per million inhabitants in 1871 to 332 in 1891. On the other hand misdemeanors greatly increased during the same period. In France where the criminal statistics extend as far back as 1825, it seems that serious crimes have also decreased, while slighter offenses have increased. The rate of crime against person and property during the decennial period from 1830 to 1839 was 228 and for the period between 1870 and 1879 was 127. In Germany, a comparison of the criminal statistics for 1882 with those for 1892 shows a great increase in crime against property, against the person and against the state.

This increase of crime as a whole becomes significant only when we consider the kinds of crime and the increase or decrease in each case. The most common division is into crimes against the person and crimes against property. Their proportion varies in different countries and according as we take all crimes or divide the serious from the less serious. At the present time, the greater proportion of crimes in the leading countries of the world are crimes against property. Statistics quoted by Professor Mayo-Smith showing the proportion of the different kinds of crime committed in the years 1879-80 and 1890-91, respectively, give 75 per cent. in the former year as crimes against property without violence, 13 per cent. against property with violence, 5.4 per cent. against the person, while for the latter year there were 67.3 per cent. crimes against property without violence, 16 per cent. with violence and 9 per cent. against persons. On the whole it appears that the misdemeanors or slighter offenses have greatly increased, while the proportionate number of serious offenses have slightly diminished or remained the same. Comparing police contraventions and offenses in France in the years 1826 and 1828 with those in the years 1885 and 1887, Professor Ferri finds that to every one hundred police contraventions in the former period there were 391 in the latter, and to every one hundred offenses in the former period there were 397 in the latter. At the same time crimes against the person fell off during the interval of these years at the ratio of 100 to 98, and crimes against property at the ratio of 100 to 41. In Belgium, England, Austria and Spain there was also a marked increase in the slighter offenses as compared with the more serious transgressions. In Germany and Prussia, however, the crimes against the person increased as much as, if not more than, the slighter offenses.

The Kinds of Crime.—There are some considerations which tend to weaken the obvious conclusions to be drawn from these figures. In the first place the increase of the slighter offenses is due in part to additions to the penal code. New offenses are created by law and the number of delinquents naturally become greater. Take, for instance, the great increase in slighter offenses shown by the prison statistics of Great Britain, published in 1898. The whole class of bicycle offenses has come into existence in recent years. Again, the returns upon which the statistics are based classify offenses according to the courts before which they are tried, and the apparent decrease of the more serious offenses as compared with the lighter is often due to the choice of prisoners to be sentenced by an inferior court rather than to undergo trial by jury. The effect of this is very marked when the investigations cover a long period of years, as for instance in France where there have been many new enactments resulting in the addition of new classes of offenders to the list. In England a great addition to the number of slight delinquents is due in part to the more stringent laws in regard to drunkenness. Another fact which must be borne in mind when we consider the increase of crime as a whole is the increase of population. Yet here when we consider only short intervals of time there is danger of attaching too much importance to this fact for the addition of infants and young children does not affect the number of people of the criminal age. France shows an unusually large proportion of crimes against the person; in 1890 46 per cent. of the crimes were of this character. For the same year in the United States the census showed that 21 per cent. of the crimes committed were against the person, 45.8 per cent. against property, and 22.9 per cent. against society. As to the most common forms of particular crimes, it would appear that in England more than one-half of the indictable offenses were larcenies. In France larceny was also the principal crime, but it did not bear in 1887 any such proportion as this, the larcenies numbering 1,439 out of 4,307 serious crimes tried before juries. In the United States, according to the census of 1890,

the principal crimes were larceny, burglary, assault, homicide, and disorderly conduct.

Geographical Position and Climate.—The influence of geographical position and climate has been studied with some striking results, although the matter has not as yet been thoroughly worked out. Early in the present century a study of criminal statistics seemed to bring to light the remarkable difference between the character of the crimes committed in southern, middle and northern France. In the northern and southern zone the crimes against the person and against property were in almost exactly inverse proportion; while in the northern zone the crimes against the person were in the proportion of 2.7 and those against the property 4.9, in the southern zone those against the person were 4.96 and those against property of 2.32. Later investigations have seemed to establish these conclusions in a general way. In Italy there seems to be a similar geographical distribution of crimes, those against the person being the most frequent in the south and those against property in the north. In Germany the eastern provinces show a greater propensity toward the more serious crimes than the western provinces, but this is attributable perhaps to the differing economic and social conditions in the two sections. As to the influence of the seasons, it is generally agreed that crimes against the person are more common in summer than in winter, while the reverse is true of crimes against property.

There is a marked distinction as would naturally be supposed between the criminality of cities and that of country districts. In France where the rural population is twice as numerous as the urban, 44 per cent. of the persons tried before juries in 1890 lived in towns of 2,000 inhabitants or over and only 43 per cent. lived in the country, the remaining 13 per cent. having no permanent residence. This matter is affected largely by the relative efficiency of the police. Thus in England some statistics seem to show a greater degree of criminality in the counties than in the large cities, owing to the superior police system of the latter.

Race.—The effect of race and social conditions on crime is hard to trace. In the United States there are statistics showing the relative number of criminals among the native born and the foreign born. In 1890, these attributed 57 per cent. to the foreign element. There were 882.45 native born white prisoners per million and 1,822.43 foreign born white prisoners per million. Taking the foreign born and those of foreign parentage together, there were 1,523.06 prisoners per million among them as against 753.7 per million of native whites of native parents. Here the fact that the foreign born element contains a far larger proportion of adults materially alters the conclusions which might otherwise be drawn from these figures. The foreign born made up 26.2 per cent. of the male prisoners, while the foreign born element in the male population eighteen years of age and over was 26.38 per cent. A greater proportion of foreign born prisoners, however, had been committed for offenses against society than was the case with either the native whites or the colored.

Religious Confession.—The relation of religious confession to criminality is a matter of importance, but it is difficult to obtain clear results. For Germany, the Protestant portions of the country are said to furnish fewer criminals in proportion to the population than the Roman Catholic portions. But this fact is obscured by the differences in racial temperament and by social and economic differences. Criminal statistics in regard to the Jews, however, show clearly that they have less criminality as a whole than the Christians, and yet in certain crimes to which they are more especially tempted on account of their inclination to mercantile life, they show a higher rate of criminality than the Christians. These crimes are such as forgery, fraudulent bankruptcy, perjury and slander.

Social Position and Education.—As to the effects of social position and education, they are as might be supposed quite manifest from the criminal statistics: the lower classes are more prone to crime than the higher and the illiterate than the well educated. Statistics of the relative criminality of certain occupations and professions show some interesting differences in Germany where this matter has been investigated. It was found that per 100,000 persons of criminal age condemned for crime, 1,480 were engaged in trade and commerce, 1,322.4 in industry, 717.3 in agriculture, 307.8 in domestic service, while those engaged in other or no occupation numbered 2,476 per 100,000. The table showed a greater disposition of persons engaged in industry to commit crimes against the person, than against property, while those engaged in trade and commerce committed a greater number of crimes against property and the latter fact was true also of those engaged in other or no occupation.

Sex, Age and Conjugal Condition.—As between male and females, by far the greater proportion of crimes are committed by males. In Germany for a period of five years, 1885-1890, it was found that the ratio was twenty-one females for every one hundred males. There is a difference between

the sexes in the kind of crimes which they are the more likely to commit. The women commit a greater proportionate number of crimes against property and a far smaller proportion against public order. The effect of age is of course very powerful, the criminal age being between 21-40. Yet a very large number of crimes against property are committed by persons between the ages of twelve and eighteen. This is the period during which the petty thieving is likely to be practised. As to the influence of conjugal condition on criminality it would seem that it acts as a deterrent. The majority of criminals are unmarried. Yet it is said by a German statistician that married women of the age of thirty or over are more likely to commit crimes than single women of the same age. Widowhood and divorce seem from the statistics to increase crime.

Penalties.—It is generally believed by criminologists that the severity of the penalty does not suffice for the repression of crime. In France, for instance, it cannot be said that the growth of crime has been accompanied by a relaxation of the punishment. It is a law accepted by most writers on this subject that what deters the criminal is the certainty rather than the severity of the punishment and the most important considerations on the subject of judicial repression of crime are (1) the ratio borne by the persons acquitted to the total number tried, and (2) the ratio of severe penalties to the total number condemned. The criminally inclined element in the population do not study the penal code and they understand the law only when it is applied. In case of a large proportion of acquittals, there is a tendency on their part to see in it the relaxation of judicial severity rather than a more careful weighing of the evidences of guilt. In countries, however, where the acquittals have shown no sign of increase and have even diminished, crime has continued to increase. This is especially true of France where the percentage of acquittals has steadily decreased and yet crime has increased to a great extent. In France, too, the other factor in judicial repression, namely, the ratio of severe penalties, has shown no signs of abatement. The severe punishments bear as large a proportion to the others as they did formerly. Substantially the same is true of Italy and England. Thus while repression measures have been growing stronger crime also has been on the increase. In England in 1891 out of 9,055 persons convicted of serious offenses, 7,548 were sentenced merely to imprisonment, the ordinary imprisonment being from one month to one year; 751 were sentenced to penal servitude, 678 were fined, etc., 59 were sent to reformatory schools, and 19 suffered the death penalty. In the case of the less serious crimes and misdemeanors about three-fourths were punished by fines. In 1896, 33 suffered the death penalty, 6 penal servitude for life, 754 penal servitude for a term of years, and 7,057 short periods of imprisonment.

Statistics for England and Wales published in 1897 and 1898 show a decrease of the number of persons committed to prison since the year 1880. Comparing that year with 1898 the number of persons committed on indictment decreased 19.6 per cent. and the number committed on summary conviction decreased 2 per cent. In 1898 there were 8,044 committed to prison on indictment and 145,961 committed on summary conviction. It must be remembered that the decrease of these committals has been accompanied by a considerable increase of the population. When this is taken into account the decrease for the committals on indictment is 30 per cent. and for committals on summary conviction 17 per cent. Another point which makes these figures encouraging is the increase in the number of offenses created by law during the period. There has been, furthermore, greater activity on the part of the police as well as greater administrative power in dealing with these offenses. At the same time offenses of a quasi-criminal kind have greatly increased during the same period. In 1885-6 the total number of convictions for these offenses was 229,285 as against 324,944 in 1896-7. This more than offsets the decrease of the committals to prison and when all convictions were counted up it was seen that they had increased from 519,781 in 1885-6 to 644,296 in 1896-7. At the same time it should be noted that this is partly due to the creation of new offenses. For example, bicycle offenses in 1895 under the Act of 1888 numbered 3,142. The returns show a diminution in the number of juvenile prisoners, that is, persons under sixteen. A new system has gone into operation whereby juveniles sentenced for minor offenses are placed in certain selected prisons. Efforts have been made to check their criminal career at the outset, and the work has been fairly successful. As to convicts, the average length of the sentence in 1898 was 6.86 years for males and 8.34 for females. In England a distinction has been made between the first offenders and other criminals. In 1897 the Prison Commissioners separated completely the first offenders in the local prisons from the habitual criminals. The result was successful, this class being of a much better stamp morally than the others and more susceptible to good influence. The formation of a so-called "star class" in 1879 whereby this principle was applied to convict prisons has had successful results. It was reported that out of 2,183 male convicts placed in this class between 1879 and 1896, only twenty of those discharged returned to penal servitude,

and of the 93 females none returned to penal servitude. There has recently been in England a tendency to substitute useful work for the mere unproductive disciplinary work of the prisons, and the earnings from this source have been considerable.

The failure of punishment to extirpate crime has led many writers to favor a resort to supplementary means. Special emphasis has been laid in recent years upon preventive measures. Practical experience has taught men that social and economic conditions have had a far greater influence on crime than any changes which have been made in the penal codes. For instance, the removal of restraints from emigration in certain countries has greatly reduced the number of criminals. The lowering of the import tariff has in some countries done more to suppress smuggling than the severity of the laws or the guns of the coast guards. Heavy and unjust taxation has been accompanied by economic frauds which in spite of the severest penalties have existed until the taxes were abolished or reduced. The connection between the consumption of alcohol and crime would seem to be too evident to need demonstration, yet some writers pointing to the fact that statistics of the alcohol consumption do not show a parallel movement with the statistics of crime have denied the existence of any necessary connection. The answer to their arguments is that we can not expect to find social statistics moving exactly parallel to statistics relating to a single cause. The fact that crime varies with other causes than drink does not prove that drink is not an important causal element. It is absurd to hold that what is injurious to the individual should not be injurious to a society composed of individuals. In many countries efforts have been made to uproot the evil of alcoholism but the results are not very marked. Indirect influences, such as the improvement of economic and intellectual conditions have probably had more effect than statutory enactments. Other instances of the prevention of crime through measures of improvement brought about by advancing civilization might be multiplied indefinitely. The importance of this aspect of the subject lies in its indication of the methods which should be adopted for the checking of crime. It is far more important to set social forces in motion and to erect barriers to crime than to rely on improvements in the penal code.

Proposed Reforms.—Some of the practical reforms suggested by recent writers have resulted from the perception that crime is a product of social, anthropological and physical factors. They believe that the object of punishment is not retribution and that its measure should not be the result of an estimate of the moral culpability of the condemned. The action against a criminal is regarded by them as a measure merely for the defense of society, and the punishment should be calculated with reference to its efficacy in removing the cause of danger. An arbitrary scale of penalties proportioned to the degrees of moral guilt appears to the modern criminal sociologist as wholly absurd.

It will be possible here to mention only a few of the practical reforms proposed. Some have been tried or have long existed in certain countries. Such for instance is the Scottish system of distinguishing by the verdict of "not proven" between fully demonstrative innocence and the doubtful cases in which guilt could not be legally established. Another reform proposed is the revision of judicial errors in the interest of the unjustly condemned and the indemnification by the state for an injury to a citizen resulting from this cause. It has been proposed that a sum should be set apart by the State to indemnify the victims of miscarriage of justice. The "Positive School" also advocates the elimination from the penal code of the slight contraventions which are constantly being added to the list, such for instance as acts committed by people through negligence or imprudence. These they say should be reckoned as merely civil offenses.

In regard to existing methods of securing information, conducting trials, and rendering a decision, later writers have offered many criticisms and suggestions. For one thing, in the collection of evidence it has been proposed that more attention should be paid to the anthropological factors of crime. Expert knowledge of criminals should be required of those who conduct inquiries. Police agents and examining magistrates should have the advice of experts in criminal anthropology in their work. For example the extension of systems like Bertillon's for the identification of criminals is desired. Again there are certain criteria for the credibility of witnesses which could be applied by men versed in psychology and neurology to far better advantage than by those merely learned in the intricacies of the law. If a judge requires experts in such cases as forgery, poisoning, etc., why, it is asked, is expert knowledge not needed equally in other cases? The credibility of a person's testimony can often be determined only by a knowledge of neurotic conditions. The tendency of hysterical persons to slander and of children to tell untruths would be cases in point. And a double importance attaches to this because the expert knowledge would not only answer the question of guilt or innocence with greater certainty but would classify the criminal and indicate what form of punishment was best suited to his case. For the later writers do not believe in fixed punishments. They would

have punishments adapted to each case with a view to crushing out the criminal instinct wherever possible. They would prescribe a punishment as a physician would prescribe a cure, except in cases of confirmed criminality, in which there was small chance of amendment. Criminal lunatic asylums are approved by many. A "rational system of punishment" was proposed by Garofalo, which for certain classes of murderers proposed the death penalty or criminal lunatic asylum, and for other offenses made a threefold division of, (1) persons of violent or impulsive characters, (2) dishonest criminals and (3) of persons guilty of outbreaks against authority, the punishment in these last three classes of cases being elastic and conditional. In general it is the idea of the later school that there should be no fixity in the periods of detention or segregation, that the defensive measures should be adapted to the various types of criminals, and that the system of damages or indemnification should be better worked out. On this last point it has been urged by some that the criminals should be compelled to pay damages to the injured party.

Many attempts have been made in recent years to prevent discharged prisoners from returning to their criminal career. There has always been a large proportion of recidivists, that is people who show persistent criminal tendencies and commit crime anew after undergoing penalties. Societies have been formed to help discharged prisoners to lead honest lives and prevent a recurrence of crime. In England these societies are known as the Discharged Prisoners Aid Societies, and since 1887 there has been one of these bodies attached to every prison in England and Wales. As their name indicates their purpose is to aid with money or encouragement persons who have served their sentences for crime. A recent report of the work of these societies during the year 1896 declares that many of them realize fully the objects for which they have been established. It is estimated that out of 169,137 discharged prisoners 26,000 received offers of help from these societies. The theoretical criticism of the purposes of these organizations rests on the ground that aid is due rather to the honest poor who are trying to lead respectable lives in spite of temptation than to those who have yielded to temptation and become criminals. The practical objection urged against some of these societies is that they do not keep up with the times in the knowledge of criminology and allow themselves to be swayed by philanthropic zeal which is often misdirected. Some of them have left the work to a few zealous members and the body as a whole has taken comparatively little interest in it. Yet it is admitted that the great majority of these societies have been well managed and that their influence has been for good. The Prison Commissioners have favored this plan of aiding discharged prisoners and have sought in so far as possible to promote its effectiveness.

Criminal Anthropology.—The school of Lombroso and Ferri has many disciples. While some of those who are intimately associated with criminals in the care or correction of them may deny the presence of any abnormal condition, and refer all crime to vice and "sinful desire," the vast majority of students of penal law and of the development of the criminal must admit that biological anomalies exist in the physical condition of delinquents. Lombroso has surpassed all former writers on this theme in covering a wider field of investigation, in imparting a more systematic character to his inquiries, and in drawing practical conclusions from them. The habitual criminal is to be distinguished from the average member of society by a much higher percentage of physical anomalies, consisting of malformations of the skull, brain and face, of the ear, eye and its protecting structures, nose, mouth, teeth and tongue, arms, and legs. There are also nervous and mental peculiarities and sexual anomalies. Lombroso places the criminal midway between the lunatic and the savage, as a product of pathological and atavistic anomalies. He reports the results of the examination of the crania of 609 criminals as follows:

	Per Cent.
Projecting superciliary ridges.....	46
Anomalies of the wisdom teeth.....	44
Closure of the sutures.....	43
Microcephaly	32
Plagiocephaly	25
Wormian bones	22
Simple suture	18
Median occipital fossa.....	16
Symbolic suture	13
Occipital flattening	13
Incus bone	14
Stenocrotaphy	10
Trochocephaly	9
Subscapocephaly	10
Oxycephaly	4

	Per Cent.
Coexistence of many anomalies.....	43
Isolated anomalies	21

From the study of 236 crania by Corre, Benedikt, Flesch, Roncoroni and Ardu, Lombroso compiled the following table:

	Per Cent.
Retreating chin	10
Obliquity of orbit.....	19
Enormously large upper jaw.....	19
Prognathism	69
Frontal process of the temporal bone.....	48
Anomalous nasal notch.....	48
Traces of the optic base.....	9
Synostosis of the atlas with the occipital bone.....	7
Sclerosis	36
Masculinity in women.....	9

In the brains of criminals were found anomalies in the depth and direction of certain fissures, superficiality and duplication and triplication of certain gyri, formation of opercula or uncovering of certain regions. Histological examination reveals the absence of the internal granular layer of the cerebral cortex, an exaggerated size and scarcity of the large pyramidal cells, and the presence of nerve cells in the white substance, as in the gallinaceæ (Roncoroni). Lombroso found, in 6,304 living criminals, a greater stature in the minor and a lower stature in the adult delinquent than in the normal individual. He found also in these delinquents darker hair, frequent facial asymmetry, inequality of the pupils, crookedness of the nose, a retreating forehead, prominent cheek and jaw bones, pale—occasionally paretic—faces, large ears and other anomalies, different sets of anomalies occurring in different types of offenders. An examination of 800 persons of good reputation by Lombroso revealed the presence of several of the characteristics mentioned, but rarely so grouped as to form a true criminal type. He has compiled the following table showing the proportion in which certain degenerative characteristics occur, based on a study of 25,000 individuals:

SIGNS OF DEGENERATION.

	With five or more.	With three or more.	Without or with one or two.
Normal.....	4 per cent.	24 per cent.	72 per cent.
Epileptics.....	29 "	55 "	16 "
Delinquents.....	27.4 "	88.5 "	89.4 "
Insane.....	26.8 "	55.2 "	18.4 "

Lombroso found 9 per cent. of adult and 40 per cent. of minor criminals were tattooed. He quotes Lacassagne's figures, 15.4 per cent. between the ages of 5 and 11 years; and Battistelli's figures, nearly 31 per cent. of minor criminals. Besides precocity and frequency, tattooing of delinquents expresses in the designs and mottoes chosen the violence, or vindictiveness, or moral obliquity of the individual. Special tests corroborate the inference that criminals possess diminished sensibility to pain. Ottolengui and Madame Tarnowsky found a marked diminution of olfactory and gustatory sensibility, as well as a diminution of vision in delinquents. Lombroso finds criminals affectionate, but yet dominated by pride, vanity, a spirit of vengeance, cruelty, lust and a love of drinking, gambling and revelry. He enumerates the following varieties of criminals: (1) epileptics and born delinquents, including the "morally insane;" (2) delinquents from passion and violence, the impulsive offenders in whom repentance and remorse follow quickly on the heels of the criminal act; (3) criminaloids, for whom the occasion furnishes the opportunity for the crime; (4) criminals from habit, consisting of the members of the last class, hardened and deteriorated by imprisonment and disgrace or debased by alcohol; and (5) insane criminals.

CRISPI, FRANCESCO. See ITALY (paragraphs on History).

CROATIA AND SLAVONIA are provinces in the kingdom of Hungary having a combined area of 16,773 square miles and a combined population in 1890 of 2,200,977. According to the official enumeration 85¼ per cent. of the total population are engaged in agriculture. In January 1896, a new survey showed that the extent of

land devoted to agriculture and gardening had steadily increased but the land devoted to higher cultivation had diminished with the exception of the vineyards. In the southwest and west the greater part of the forest and meadow land and the unproductive tracts is found. The Hungarian *Reichstag* has legislative authority for Croatia and Slavonia in regard to matters which are the common concern of those provinces and Hungary. The Croatian and Slavonian delegates, about forty in number, are allowed to speak their own language in that body although the official language is Hungarian. In the Hungarian executive departments there is a special minister for Croatia and Slavonia. The provincial Diet of these two provinces consists of 90 members chosen by the people and of certain dignitaries (not to exceed one-third of the Diet) holding their seats by inheritance or royal nomination. There is a low property qualification or the payment of a small tax required of all electors who do not practice certain professions. See AUSTRIA-HUNGARY.

CROUP. See PUBLIC HEALTH.

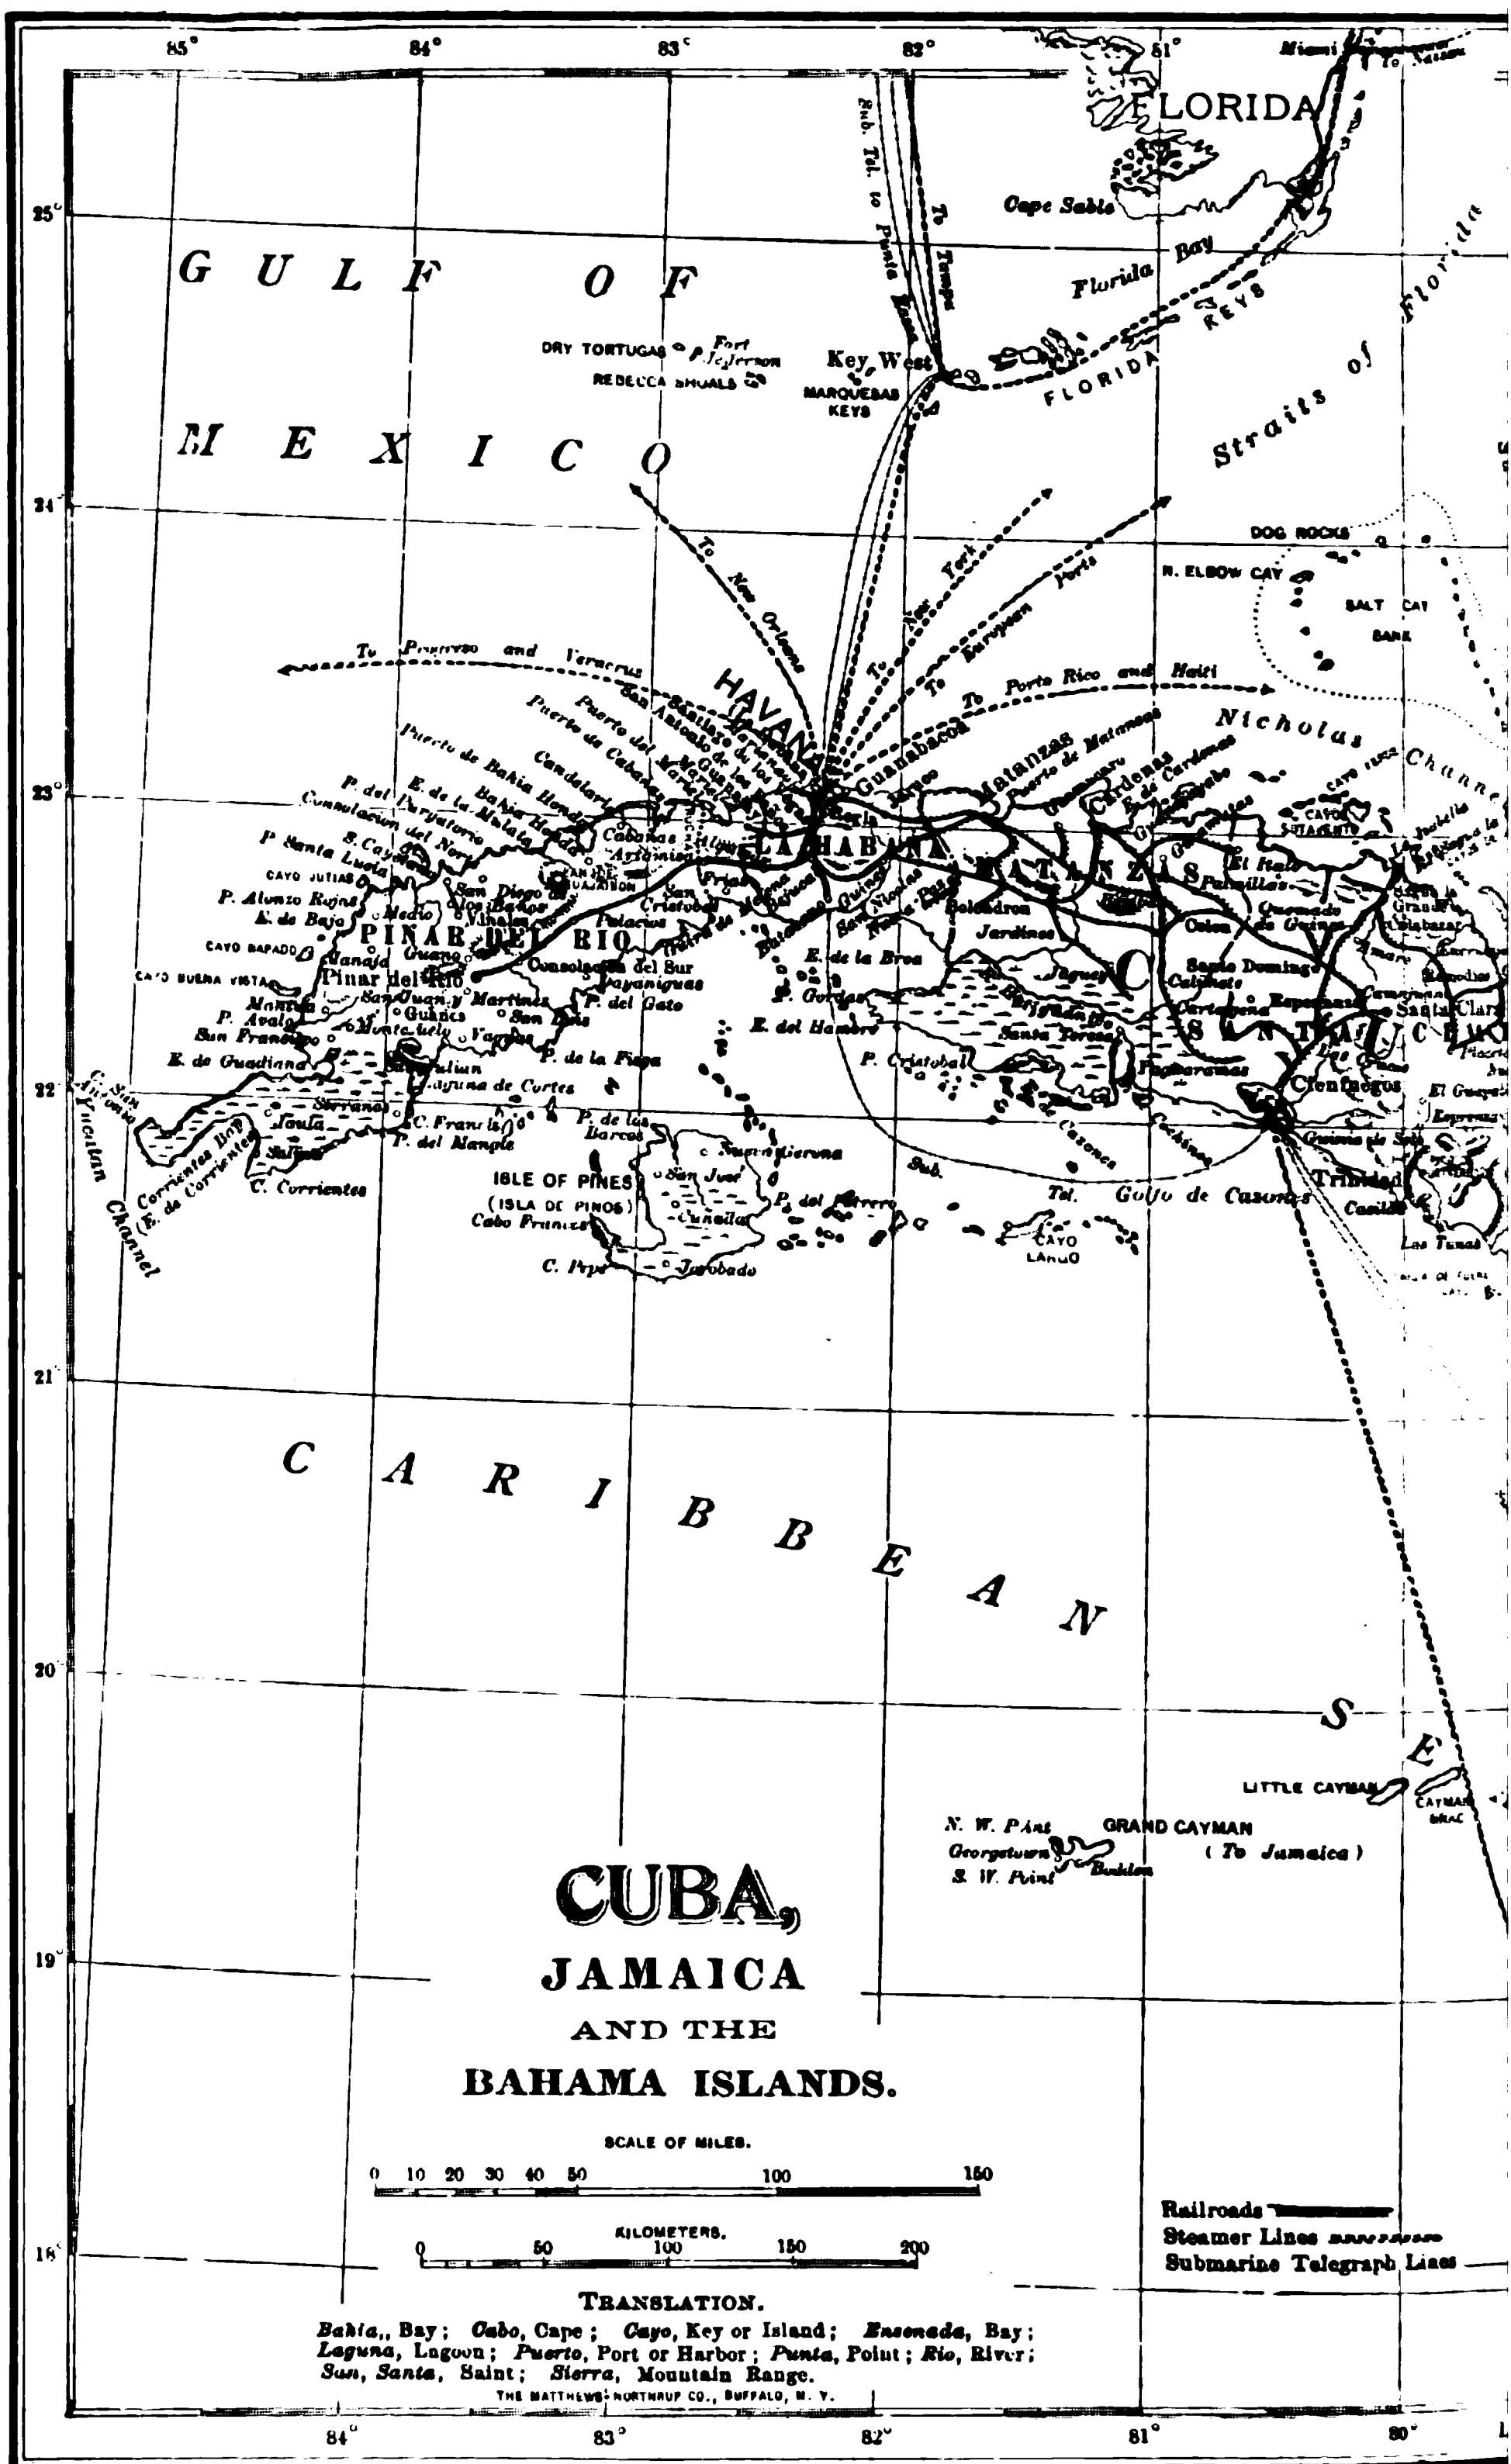

CRUGER, STEPHEN VAN RENSSELAER, died at Bayville, Long Island, N. Y., June 23, 1898. He was born in New York City, May 9, 1844: was educated there and in Europe, where he was at the outbreak of the Civil War. He immediately returned and received a commission as first lieutenant in the One Hundred and Fiftieth New York Volunteers. For gallantry at Gettysburg he was appointed adjutant of his regiment, which was soon assigned to Sherman's army. He was twice wounded in the battle of Resaca, was discharged, but was restored to his former command and participated in Sherman's march to the sea. He was promoted to a captaincy, was brevetted major and lieutenant-colonel for meritorious services in Georgia and the Carolinas, and was mustered out in June 1865. He then entered the real estate business in New York and became prominent in political, business, and social circles. He was comptroller of the Trinity Church corporation, and was connected as director and trustee with many large business corporations. He was a strong Republican and was a member of the most prominent clubs in New York. His wife was Miss Julie Grinnell Storrow, who writes over the pen name of Julien Gordon.

CRYSTAL-GAZING. See HYPNOTISM.

CUBA, the largest island of the West Indies, having an area about equal to that of the State of Pennsylvania, and a population estimated in 1887 at 1,631,687, of whom 528,998 were negroes and mulattoes. No trustworthy figures were available for the population at the close of the war in 1898. The capital is Havana, with a population of about 220,000. The coast line is very extensive, and affords a number of safe harbors. The northern coast is about 918 miles long and has thirty-two harbors; the southern is 972 miles long and has twelve important harbors. A chain of mountains traverses the island from southeast to northwest, the highest portion being found in the southeastern part. The soil of Cuba is well watered. Among the numerous streams may be mentioned the Cauto, 150 miles long, and the Sagua, 111 miles long.

Political Divisions and Cities.—Cuba comprises six provinces which were divided under the Spanish administration into three regions: the western including the provinces of Pinar del Rio and Havana; the central comprising Matanzas and Santa Clara; and the eastern comprising Puerto Principe and Santiago de Cuba. Havana, which under the Spanish rule was the residence of the Captain-General, and the seat of government is situated on the west side of the port of Havana, having an excellent harbor, the entrance to which is guarded by Morro and La Cabana on one side and on the other by the Punta and Reina batteries. It is well fortified, including besides the defenses mentioned the fortifications of Castillo del Principe, Fort Atarés, Fort No. 4, and other works. In the older parts of the city the streets are narrow, but outside the walls there are a good many wide avenues. The city is well provided with educational institutions, including a university, a school of fine arts, theological and normal schools, etc. Among its notable buildings are the cathedral, and the palace of the government. The city contains a navy yard, arsenal, gun factory and repair shops, and a large number of cigar and cigarette factories, tanneries, and manufactories of confectionery, rum, candles, gas, beer, carriages, soap, etc. Next in size is the city of Santiago de Cuba, which is situated on the southeastern coast of Cuba, and has a population estimated in 1895 at 59,614. Of the other important cities may be mentioned Matanzas, with a population of 49,384 in 1893, Cienfuegos (pop. 1895, 28,030); Cardenas (pop. 1893, 23,517); Pinar del Rio, the capital of the province of the same name (pop. about 30,000); Puerto Principe, capital of the province of the same name (pop. about 49,000); Santa Clara, (pop. about 32,000); Trinidad, (pop. about 29,000); Santi Espiritus, (pop. about 29,000); and Sagua la Grande. (pop. about 18,000).

Agricultural Resources.—The soil of Cuba is marvelously fertile and it is said that even when the same crops are grown on the same piece of land for a hundred

years, as in the case of the old sugar-cane fields, no artificial fertilizers are necessary. The exact figures for the proportion of the island which was cultivated are not available for the year 1898, but a large part of the surface is under forests, and some portions of the island are still unexplored. The chief products are sugar, tobacco, coffee, mahogany and other timber, honey, wax, and a great variety of fruits, including pineapples, bananas, oranges, mangoes, guavas, and cocoanuts. Of these sugar and tobacco are by far the most important. The growing and manufacturing of sugar were until the outbreak of the Cuban insurrection exceedingly profitable employments. It is said that the total sugar crop of any other West Indian island was barely equal to the output of three or four of the largest Cuban manufactories. The special advantages which Cuba possesses result from the increase in the size of sugar plantations, the fertility of the soil, the extensive rainfall which renders irrigation unnecessary, and finally, the proximity to the United States, which affords a good market for the product. The insurrection, followed by the Spanish-American war, greatly injured the sugar industry. During the insurrection the sugar planters and manufacturers suffered severe losses, and it is said that in 1895-96 there was a decrease of $77\frac{1}{2}$ per cent. in the total production. The average tobacco crop is estimated at 560,000 bales, each bale equalling 110 pounds. Cuban tobacco is of superior quality. It is produced in the largest quantities in the western part of the island, but there are some places where the production is considerable in the provinces of Santa Clara and Santiago de Cuba.

Cuban Ore Deposits.—Gold is found in the provinces of Santa Clara and Santiago de Cuba, but lack of capital has retarded its development; other veins are said to occur near Las Meloneras, El Descarso and Holguin. Both copper and iron are known in the province of Santiago de Cuba, and of the latter the most important deposits are those of the Juragua Iron Co., whose mines yielded 350,000 tons in 1893. Both iron ores and manganese from this province are exported to the United States for use in steel manufacture. Petroleum is known near San Juan in Santa Clara province and Languinilla in Matanzas province, while asphaltic shales outcrop not only in this latter province but also in Cardenas Bay, where their thickness is reported to be 70 feet.

Commerce.—For the year ending in April, 1896, the total value of the imports was \$66,166,754; of the exports \$94,395,536. The trade of Cuba has been mainly with the United States and Spain. There was a serious falling off in the amount of exports and imports in consequence of the insurrection and the Spanish-American war. In 1893 the trade of the United States with Cuba is given as \$78,706,506 imports from Cuba into the United States, and \$24,157,698 exports from United States to Cuba. In 1897 it had fallen to \$18,406,815, imports, and \$8,259,776, exports. The United States has received nearly all the tobacco and about one-half of the cigars exported from Cuba. Other Cuban articles which have found a market in the United States are fruits, molasses, wood, for manufacturing purposes, and iron ore. The exports from the United States to Cuba include hog products, wheat, flour, boards, deals, planks, joists, etc., coal, corn, locomotives, potatoes, mineral oil, boilers and parts of engines, carriages and street cars, etc. With Spain, which ranks next to the United States in the importance of its trade with Cuba, the imports from Cuba amounted in 1896 to \$4,257,360, and the exports to Cuba to \$26,145,800. Of other countries than Spain the most important in respect to their trade with Cuba and Porto Rico in 1896 were the United Kingdom, France and Belgium. The exports of sugar declined from 832,431 tons in 1895, to 235,628 tons in 1896. Owing, it is said, to the discriminating duties imposed by the former Spanish tariff in favor of Spanish products, the imports from the United States formed a relatively small proportion of the articles consumed in Cuba, yet the foreign trade with the United States as a whole was in normal years much larger than that with Spain on account of the great exports from Cuba. The trade with Spain consisted mainly of imports from Cuba to Spain.

Tariff.—The former Spanish tariff appears to have been framed solely in the interest of Spain and the rates levied were full of inequalities, and in some instances virtually prohibitory. When the province of Santiago de Cuba fell into the hands of the United States government, the latter country adopted as a temporary measure a rate of duty corresponding generally to the minimum levied under the old tariff, that is to say, the rates classed as revenue duties were adopted as a basis for the new tariff, although a duty was imposed on leaf tobacco, cigars and cigarettes. Imports from the United States were rendered dutiable like other commodities. A large number of articles were placed upon the free list. The tariff applied first to the province of Santiago de Cuba, but by the terms of its proclamation it was to be applied to all parts and places in the island of Cuba as soon as they should be occupied or possessed by the forces of the United States. A special commissioner was sent out by the United States to report upon the agricultural, industrial, commercial and financial conditions of the island. The report, which was made public

in November, 1898, recommends the substitution of a new tariff which would reduce all duties about 60 per cent. as compared with the old Spanish rates, and would place upon the free list cattle and agricultural implements. The commissioner said that the United States officials would be able to collect as much revenue on a tariff the duties of which were nearly two-thirds less than those levied by the existing law as the Spanish government had collected under the old system, since, owing to the dishonesty of the officials, a large part of the returns did not reach the Spanish government. It was expected that the reduction would result in a far greater importation and would increase the trade with the United States. The proposed tariff has regard to the home industries of Cuba, and aims not to reduce the duty beyond the protective point in such cases. Among the the classes of articles on which a reduction ranging from 60 per cent. to nearly 77 per cent. was proposed were the following: 1st, stones, earths, ores, etc.; 2nd, metals and metal manufactures; 3rd, chemicals; 4th, cotton manufactures; 5th, hemp, flax, jute, and other vegetable fibres and their manufactures; 6th, wool, bristles, etc., and their manufactures; 7th, silks and their manufactures; 8th, paper and its applications; 9th, wood and wood manufactures; 10th, animals, and animal wastes; 11th, instruments, machinery, etc.; 12th, food products.

Transportation and Communications.—In 1898 there were ten railway companies in Cuba owning over 1,000 miles of main line, besides which there were many private branch lines to the important plantations. The Western Railway, which was acquired by an English Company in 1891, connects Havana with Pinar del Rio. An English Company also owns the Marianao Railway, a short line connecting Havana with Marianao, and having a branch line to a village on the coast. Other lines join Cardenas and Santa Clara; Matanzas with Murga and Guareinas; Concha and Cruces; Cienfuegos and Santa Clara; Caibarien and Placetas, etc. Cuba is connected by cable with the United States, the West Indies, and South America. These lines and their branches include a cable from Havana to Florida; from Havana to Santiago de Cuba and Cienfuegos; from Havana to Jamaica, Porto Rico, the lesser Antilles and the Isthmus of Panama; and from Havana to Santiago de Cuba, Hayti, San Domingo, Venezuela and Brazil. The government owns the telegraph and telephone system, but has farmed out the latter to a private company for a term of years.

Finance.—The estimated revenue for 1897-98 was 24,755,760 pesos; the ordinary expenditures, 26,119,124 pesos; and the extraordinary revenue, 80,000,000 pesos. (The United States Treasury Department in 1898 placed the value of the peso at 92.6 per cent.). The Cuban debt on July 31, 1895, was estimated at \$295,797.264; in 1897 it was about \$350,000,000, and in the autumn of 1898, at the time when the Peace Commission was in session, it was estimated at \$500,000,000. The main sources of revenue under the Spanish rule were the customs duties, and the principal expenditures have been for those items which have had to do with Spanish control. The report of the special commissioner above mentioned gives the sovereignty expense as follows: (1) Interest on public debt and general expenses, \$12,574,700. (2) Religion and clergy (State religion and justice) \$329,072. (3) War, \$5,896,740. (4) Navy, \$1,055,136. (5) Executive, \$2,645,150. Total, \$22,500,808. No satisfactory estimates of the new budget were possible before the close of the year 1898, but it was thought that under a more economical management, far less revenue would be required for the necessary expenses of administration.

Currency.—The basis of the Cuban currency system is gold, but there are many kinds of depreciated currency in circulation. The gold coins current in Cuba are the Spanish twenty-five peseta, or "Alfonso," and the French twenty franc piece, or "Napoleon." The Spanish silver dollars in circulation have been taken at their daily value, which fluctuates with the changes in Spain's credit. In 1898 bank-note circulation was practically worthless, having sunk to less than ten cents on the dollar.

Education.—The latest report of the U. S. Commissioner of Education (published January 1899) gives the number of school children in Cuba, according to the report of 1889-90, the latest available, as 30,994 or nearly 2 per cent. of the total population. The condition of the schools at the end of the Spanish-American War, and the lack of any institutions of higher education in Cuba and Porto Rico, made it most desirable that some acts of concerted benevolence should be taken. A movement was accordingly started in New York to give the young men of Cuba some advantages of education in the institutions of learning in the United States. This work is being done by the Cuban Educational Association, organized by a few earnest American educators—Major-General Joseph Wheeler being president and Gilbert K. Harroun, secretary—for the purpose of accepting and administering the offers made by American colleges to give free tuition to two or more reputable Cubans each, competent to pass the necessary examinations to secure admission to such colleges. A large number of applicants from Cuba and Porto Rico asked

for allotment in the educational institutions of the United States, but had not the money to support themselves. Parents and guardians in some cases were willing to go under bond or to mortgage their property in order to guarantee the subsequent payment of money advanced for the support of the young men during the time of their education in the United States. To these requests the colleges of the United States made a generous response. The office of the secretary of the Cuban Educational Association is at 289 Fourth ave., New York City.

HISTORY.

For an account of the Cuban insurrection and the events in Cuba during the war, see the article **SPANISH-AMERICAN WAR**. The present article is concerned only with the affairs of Cuba after the war had closed.

Political Situation.—In spite of the slight feeling of jealousy betrayed by the Cuban forces at the close of the war in connection with affairs at Santiago, the President of the Cuban republic expressed in a proclamation the gratitude of the army and citizens of Cuba for the work of the Americans in liberating their country. Nevertheless there were signs of uneasiness among the people lest the United States should attempt to govern the island without consulting the wishes of the natives and there were signs too that the party formerly favorable to autonomy under Spanish rule were drawing toward the former insurgents in defense of the absolute independence of the island. The autonomists said it was their purpose to accept the existing order of things, meaning thereby the separation from Spain, and to unite with all who were in favor of Cuban independence. Commissioners were appointed by the United States and Spain to arrange for the evacuation of Cuba by the Spaniards. The Spanish commissioners were informed that the evacuation must be completed by December 1, but the difficulty of transporting so large a body of Spanish soldiers (estimated at 120,000), led to an extension of the time to January 1, 1899. Early in December the provinces of Puerto Principe and Pinar del Rio were evacuated.

Santiago.—After the capitulation on July 17, 1898, Santiago was occupied by the American troops. General Leonard Wood was made military governor of the department of Santiago and the vigor and efficiency which he showed in his administration attracted much attention. The city was in need of a thorough sanitary overhauling and General Wood applied American methods to the task with extraordinary energy. A street cleaning brigade was formed and the city of Santiago underwent a vast improvement. Under this provisional government civil liberty of the individual was guaranteed, the courts of justice were maintained, the rights of popular assembly, freedom of worship, habeas corpus and freedom of the press, as well as the other safeguards of individual liberty were declared. The building of roads from Santiago to Holguin and Guantanamo was begun and the supreme court composed of Cubans was installed on December 2. The Cubans themselves took up the work of improvement and in many instances cleaned and repaired their own houses.

Havana.—While the Spaniards were still in control of Havana there was much confusion. The Spanish troops showed a mutinous spirit on account of the delay in paying them and but for the prompt action of the authorities a rebellion might have broken out. The silver expected by General Blanco for the payment of the troops did not come and the latter were sent to Spain without pay. There was a mutiny of the Orden Publico but its leaders were disarmed and shipped to Spain. The Civil Guards also showed a mutinous spirit but they were suppressed and embarked. Affairs were kept from taking a serious turn largely through the sternly repressive measures of the military governor, General Arolas. For some weeks there was danger of an armed conflict in the streets of Havana, where large bodies of discontented troops were encamped. At times the enmity of the troops toward the Cubans broke out in street fights and riots. In one of these fracas on December 11 several Cubans were killed or wounded and on December 13 another outbreak on the occasion of a funeral procession resulted in the wounding of 11 persons. Several fatalities also occurred at a riot on December 18. The autonomist cabinet, which had been formed in accordance with the scheme of autonomy offered by the Spanish government, was dissolved on December 15. In the meanwhile General Blanco, the Captain-General of the island, resigned on November 23 and was succeeded by General Castellanos. Similar work to that done by General Leonard Wood at Santiago was also needed at Havana. There was an especial need of prompt action since American troops would have to be sent to take the place of the retiring Spanish garrisons. Accordingly the President of the United States and the War Department decided to appoint a commission of experts for the purpose of choosing camp sites and making recommendations as to supplies, drainage, transportation, etc., in advance of the sending of American troops. Colonel George E. Waring, Jr., volunteered his services on this commission and the offer was gladly accepted by the President.

Colonel Waring became the chairman of the commission and in addition to the task of preparing for the reception of the troops he was charged with the duty of inspecting sanitary conditions of Havana and the other cities of western Cuba with a view to recommending measures for the eradication of yellow fever. He entered upon his duties early in October and at the end of that month returned with a report which proved to be of the greatest value, but in the course of his work he contracted yellow fever and died soon after his return (October 25). The sanitary measures which he recommended would cost several millions of dollars but opinion was practically unanimous as to the necessity of promptly carrying them out.

Attitude of the Cubans Toward the United States.—On November 7 there was an assembly of Cubans at Santa Cruz where the disbandment of the troops and the future relations of the United States were discussed. One party, representing the extremists, opposed any further intervention on the part of the United States in the affairs of the island and especially the garrisoning of the cities by United States troops. A commission was appointed through the influence of General Garcia to prefer the requests of the Cubans to President McKinley, but its work was checked by the death of General Garcia in Washington on December 11. The Cuban army was not formally disbanded but individual applications for discharge were granted and here and there companies gave up their arms. After the Spanish evacuation parts of the Cuban army garrisoned many of the towns. One of the obstacles to disbandment was the lack of funds for the payment of the troops. It was said that only among an irresponsible element of the population was there any hostility toward the authority of the United States. There were signs at the close of the year that the business prospects of the island were improving and that American capital was seeking investment there. It was reported toward the close of the year 1898 that the demand for labor on the sugar plantations was on the increase, although there was surplus labor in Havana. A plan was proposed for conveying the able-bodied men who were in need of labor to the districts of the sugar plantations where labor was scarce on account of the great number killed during the war, or weakened by disease or starvation. It was also said that unemployed labor could be taken up in the mining industries if provision was made for its transportation.

Government.—Major-General John R. Brooke, U. S. A., was made Military Governor of the island, to assume control upon the formal evacuation by the Spaniards on January 1, 1899. His authority was coextensive with that formerly exercised by the Spanish Captain-General. At the close of the year Cuba was under a military government, being for military purposes a territorial division corresponding to the Territories of the United States. The headquarters of the division of Cuba were at Havana. Under General Brooke, Major-General Leonard Wood remained as governor of the eastern end of the island. Major-General Fitzhugh Lee was placed in charge of all the troops in the province of Havana; General Simon Snyder was in command in the province of Santa Clara, General L. H. Carpenter in Puerto Principe and General G. W. Davis in Pinar del Rio. The civil administration of Havana, which was separate from the military, was entrusted to Major-General William Ludlow, who was charged with all that related to the collection and disbursement of the revenues of the port and city and to its police, sanitary and general government under such regulations as might be prescribed by the President. In spite of the riots which took place in Havana during the closing days of the Spanish rule, the difficult and delicate work of transferring the control of the island from Spain to the United States was, on the whole, managed creditably to all parties concerned. The many problems to be solved in connection with Cuba as they appeared at the close of the year were the relief of the great distress caused by the war, the promotion of industry which had been almost paralyzed as a result of recent events, and finally the carrying out in the other cities of Cuba those thorough-going sanitary reforms which General Wood had introduced with such success in Santiago. As to the general political situation, it was clear that the leading men in Cuba were much concerned over the question of annexation to the United States. While many of them believed that the absorption of Cuba into the United States was the ultimate destiny of the island, they thought that the best plan for the present was to give Cuba her independence in order that she might work out her own form of government and adapt it to the needs of her people without interference from abroad.

CUBAN EDUCATIONAL ASSOCIATION. See CUBA (paragraph Education).

CUBAN FEVER. Cuban Fever or Calentura is the name given to a severe fever which attacked many of the American troops during service in Cuba or shortly after returning to this latitude. Its status was definitely settled by James Ewing of New York, who investigated the blood of 800 patients suffering from the disease. He found it to be a variety of malarial infection.

In 1880 Laveran discovered the parasite to which malarial fevers are due, and named it the *Plasmodium malariae*. It is not a bacterium, but an animal organism.

a protozoön. It is found in the blood of patients in the form of spores, intra-corpuscular bodies, segmentation forms or rosettes, crescents, rings, and flagellate organisms. The intra-corpuscular forms are so named because they pierce and enter the red corpuscles of the blood, during the disease. These parasites have always been found in malarial diseases, and never in the case of any other disorder. Each febrile attack, during the course of malarial fever, is accompanied by the appearance of a new generation of these parasites in the blood, being due, probably, to toxins set free by the young parasites. The disease can be communicated from one person to another by injecting the healthy person with blood from one suffering with malarial fever and containing the parasites.

Ewing found that 80 per cent. of the cases of Cuban fever were of the æstivo-autumnal type of malarial fever, the blood containing rings or crescents, or both forms of the plasmodium. Twenty per cent. of his cases were of the ordinary tertian type, and 4 per cent. showed double infection. Many of the æstivo-autumnal cases showed typical weekly recurring attacks, and these are commonly fatal on the third attack. Jaundice was pronounced in ten cases, all fatal. Nephritis of severe grade was found in but five cases. Anæmia was noted in all the cases examined, many showing the early changes of pernicious anæmia, some of secondary pernicious anæmia. The anæmia progresses for a long time after the blood is free from parasites. Typhoid fever coexisted with malarial fever in 40 cases of the 800. In such cases, malarial paroxysms reappear during convalescence.

CULLIS, GENERAL JOHN B., died at Lancaster, Wisconsin, September 24, 1898. He was a veteran of the Civil War, and, as a Congressman from Alabama, introduced the Ku-Klux Klan bill, which resulted in the stamping out of that organization.

CULLUM, SHELBY MOORE, senior United States Senator from Illinois, was born in Wayne county, Kentucky, November 22, 1829; received an academic education and later passed two years at Mount Morris University. In the autumn of 1853 he began the study of law in Springfield, where he has since resided. Upon being admitted to the bar he was elected city attorney. In 1856 he was a presidential elector on the Fillmore ticket, and was elected to the legislature by a coalition of the Fillmore and Fremont men. He was returned in 1860, 1872, and 1874, and was elected speaker in 1861 and 1873. He served from December 1865, to March 1871, in the national House of Representatives, being a member of the XXXIXth, XLth and XLIst Congresses. He was a delegate to the national Republican conventions of 1872 and 1884. In 1876 he was elected Governor of Illinois and was reëlected in 1880, serving until February 5, 1883, when he resigned to accept an election to the Federal Senate, to succeed the Independent Democrat, David Davis. Senator Cullum was reëlected in 1888 and 1894. In July 1898, President McKinley appointed him chairman of a commission of five to consider and report to Congress upon the questions of government in Hawaii.

CUMBERLAND PRESBYTERIANS report a very prosperous year. The educational institutions prospered by the additions to their funds, the theological seminary being the recipient of a bequest amounting to \$20,000. A missionary was sent to China by the Endeavorers. This branch of the Presbyterian Church reports for 1898, 3,021 churches, 1,691 ministers with 593 probationers and a membership of 180,635. A new Synod, called Indianola, was formed in Oklahoma and the Indian Territory; the woman's board of missions was entrusted with the work of erecting manses and given charge of the work among the mountaineers of the Appalachian Range. A constitution was proposed for the Church Extension Associations. The Colored Cumberland Presbyterians report 224 churches, 359 ministers, and 35,000 members.

CURACOA, a colony belonging to the Netherlands, consisting of the islands Curaçao, Aruba, Bonaire, St. Eustache, Saba, and the southern part of St. Martin, has a total area of 403 square miles and in 1895 had 48,744 inhabitants. The colony is administered by a governor assisted by a council. The revenue and expenditure for 1897 were estimated to balance at 702,216 guilders (the guilder is worth about \$0.406). The main sources of revenue are duties and taxes. There is a militia of about 400 men on the island of Curaçao and a garrison of about 240; a vessel of the Dutch navy constantly cruises among the islands. In 1895 there were about 28 schools with over 5,100 pupils; at the same time the Roman Catholics numbered 40,255, the Protestants 7,909, and the Jews 808. The principal products are maize, pulse, beans, cattle, lime and salt. In 1895 there entered at the various ports 2,695 vessels of 553,656 English tons.

CURRENCY REFORM. The advocates of currency reform made considerable progress during the year 1898. In order to understand this movement, a brief sketch of its history during the two preceding years is essential.

General Nature of the Movement.—For several years the attempt has been made to embody some scheme of currency reform in our national legislation. The advocates of reform have been able and earnest men, but for a long time their views were not harmonious and they failed to unite on a single plan. The general objections urged against the existing system were first that the government ought not to be in the banking business. So long as it is pledged to issue notes in response to the money demand there will always be, it is said, a feeling of uncertainty in regard to its ability or readiness to remit promptly. The banks have special means for knowing the money demand and their notes are drawn out readily in response to it, while the government has no means of adjusting its note issues to the needs of trade. Many have feared that inflationists might gain control of the Treasury to the great detriment of the public credit. Another objection urged against the present system was the so called inelasticity of the currency supplied by the banks. By inelasticity is meant the mal-adjustment of the circulation to the commercial demand. It was said that the bank-notes were not issued in sufficient quantities to supply the money demands. This was attributed of course to the too stringent rules governing their circulation. The note-issuing function was not made sufficiently profitable to induce the banks to undertake its adequate performance. As a result merely a small portion of the representative money of the country consisted of bank-notes, the rest being made up of silver certificates, silver dollars, treasury notes and greenbacks. A further objection to the existing monetary system was the alleged danger to the gold reserve. As the government is required to redeem the treasury notes and greenbacks in gold it must retain a gold reserve for this purpose. The panic of 1893-94 has been cited by the advocates of currency reform as a proof of the unsoundness of the system. If the banks, owing to the possession of more liberal privileges, were enabled to supply an adequate currency it was held that the government would be relieved from the constant strain upon its resources. Instead of redeeming greenbacks in gold and issuing new ones in their place,—the “endless chain” as it has been called,—the government would be able to withdraw from the banking business and retire the greenbacks. Such have been some of the most important arguments of the advocates of currency reform. The opposition has ranged all along the line from those who really favor fiat money to those who hold conservatively to the currency principle, and fear anything which looks like an extension of the banking principle. In the political campaign of 1896 promises were made by the “sound money” party that an honest effort would be made to improve the currency. For various reasons all action in the line of currency reform was delayed for some time. The advocates of reform measures, however, gained ground and the principal points of interest in the history of the movement to the close of the year 1898 are as follows:

The Indianapolis Monetary Conference.—At a meeting held in Indianapolis, December 1896, it was proposed that a national monetary conference should assemble in that city. This conference met on January 12, 1897, and consisted of 270 delegates representing trade and commercial organizations in twenty-four States chiefly in the north and east. The purpose of this body was to show Congress and the people that practical business men desired reforms in the existing currency and banking systems. The cardinal points in these reforms were first, the strict maintenance of the gold standard on a permanent basis; second, the banishment of the United States treasury from the banking business with the retirement of all kinds of United States notes; third, the rendering of the banking system safe and elastic. The conference appointed an executive committee to induce Congress to choose a monetary commission to report on the proper remedies for the present monetary evils. If the executive committee could not secure congressional action, it was to appoint such a commission itself. The committee went to Washington and tried to influence Congress to take the desired action. On July 24, 1897, President McKinley sent a message to Congress recommending the appointment of a non-partisan commission of well-informed citizens of different parties, entitled to the confidence of Congress and the people, whose duty it should be to recommend such changes in the present banking and currency laws as they deemed expedient. A bill embodying the policy recommended in the President's message passed the House but was killed in the Senate.

The Monetary Commission.—The executive committee now set to work to organize a monetary commission at Chicago. It succeeded in securing as members of this body some of the most prominent statesmen and financiers in the country. The chairman was ex-Senator George F. Edmunds of Vermont. The commission met on August 10, 1897. During the summer and fall sub-committees worked on a report which in December was submitted to Congress. This report was published on January 3, 1898. The new meeting of the commission was appointed to consider the report—January 20-26. The report was approved.

Recommendations of the Monetary Commission.—The chief recommendations of the monetary commission were as follows: In the first place, there was to be created a separate division of the Treasury in which would be deposited all funds held against outstanding gold, silver and currency certificates, silver bullion behind the Treasury and the guarantee and redemption funds of national banks as well as an amount of gold equal to twenty-five per cent. of all government notes and five per cent. of all silver dollars. All government credit money including silver dollars to be redeemed in gold with the exception of silver certificates which should be redeemed in silver dollars. Government and bank-notes to be in the denominations of \$10.00 and over; silver certificates under \$10.00. The issue of gold and currency certificates to cease.

Secondly, as to the retirement of government notes. The plan of the commission provides that government notes shall be paid out only in exchange for gold coin and currency certificates except that they may be used by the secretary at his discretion for the purchase of United States bonds; these notes to the amount of fifty million dollars to be canceled at once, then for the next five years to be canceled dollar for dollar with the increase of bank-notes, and finally after five years to be canceled one-fifth each year until cancellation is complete.

Thirdly, the gold reserve is to be replenished by the secretary from surplus revenues or by the sale of silver bullion or by borrowing in one of three ways: First, by the sale of three per cent. twenty year gold bonds payable after one year: Secondly, by the sale of three per cent. gold certificates of indebtedness payable in one to five years; Thirdly, by borrowing at not over three per cent. in sums not less than fifty dollars for which neither bonds nor certificates are issued, the record being kept in the books.

The Commission's Proposals as to the Banks.—The provisions in regard to banking are important. The limit of note issues is to be the amount of capital. The lowest denomination is ten dollars. For an amount of notes in excess of sixty per cent. of the capital a repressive tax of two per cent. is charged and on an amount exceeding eighty per cent. of the capital a tax of six per cent is charged. The notes to be legal tender to national banks and to the government except for duties on imports. As to the security for bank-note issues it is provided that government bonds shall still be deposited with the United States Treasury. But this does not mean that the note issues are in any way limited to the amount of the bonds. The amount of the bonds is only twenty-five per cent. of the capital and after five years the bond deposit is to be annually reduced one-fifth until in ten years it is extinguished. The main security for deposits is a common guarantee fund in gold coin equal to five per cent. of the circulation; all banks to be liable to assessment in case of the impairment of this fund. Another safeguard is the rendering of notes the first lien on the assets of the issuing bank and besides this stockholders are personally liable to the extent of their stock. As to redemption the present system of redemption by the government is to continue and each bank is required to maintain in the treasury a redemption fund to the amount of five per cent. of its circulation. No change is made in the present requirements in regard to reserves of the banks held against deposits, but a bank cannot count its deposits in the redemption or guarantee funds as part of its reserve nor its own notes as part of its cash assets. One-fourth of a bank's reserve must be in coin held in its own vaults. The number of banks permitted under these provisions is greatly increased, for there can be banks with a capital of twenty-four thousand dollars in places of four thousand population or less. The expenses of the Treasury are to be covered by a tax of one-eighth of one per cent. on capital surplus and undivided profits.

Purpose of the Proposed Changes.—Now the object of these provisions is to remove those defects in the present system which are enumerated by the commission as follows. First, too much government credit currency. Second, the continued circulation of government demand notes. Third, the failure of the currency to increase with the growth of the country. Fourth, the inelasticity of the currency. Fifth, the inadequacy of loanable capital. Sixth, the diversity of government credit money. Seventh, the difference between the nominal and the bullion value of the silver dollar. Eighth, an unsystematic bank currency. Ninth, the confusion of the Treasury's functions. Against the present banking system the commission has urged that it requires the continual issue of government bonds and does not contemplate the ultimate extinction of the debt of the United States; that the required investment in government bonds subtracts from funds which might be loaned to advantage; and, thirdly, that the bank currency is not flexible or elastic; that is, it does not increase with a temporary increase in the demand for currency or diminish with a temporary diminution. The commission thinks that these defects can be remedied by still maintaining a national banking system, but with improved regu-

lations as to examination, supervision, etc.; by basing the issues upon convertible assets instead of government bonds; by a limitation of the issues to the amount of the unimpaired capital of the banks; by a further security of a common guarantee fund as well as of the liability of the share holders to the full amount of their shares at par; by the maintenance of the present redemption fund and method of redemption.

Criticism of the Plan.—The plan proposed by the Monetary Commission is criticized not only by those who are opposed to all attempts to reform the present system by the extension of the banking principle, but also by men who favor such a reform, and yet believe that the Commission's scheme would not realize it when put into practice. The latter declare that under the system presented by the Monetary Commission the proportion of credit money in currency would not be lessened, for bank-notes would merely be substituted for government notes. The greenback and Sherman notes would be retired, to be sure, but in their place bank-notes would be issued. Yet it is acknowledged that banks might be compelled to increase their holdings of gold under this system. There is no positive assurance, however, that this would happen, for it is argued that under a system which permits the prompt issue of notes against general assets, a smaller cash reserve is necessary than under a system permitting note issues only against deposits of coin or bonds. A more serious objection urged against the proposed system is that it will not make the currency elastic. It is argued that as the bank-notes will have all the qualities of money, and will inspire such confidence that they will be accepted in all parts of the country, there is no probability that they will be presented for redemption as the needs of trade decrease. When a bank-note is limited in its circulation to a certain locality, its issue and redemption will conform to the fluctuations of trade. But if its security be so well guaranteed that it is accepted in any part of the country, the process of redemption will be slow, and not in conformity with the varying conditions of business. It is urged that if the plan of the Monetary Commission is adopted, there is no reason why three-fourths of the money payments in excess of \$10.00 should not be effected by means of bank currency, and some of the opponents of the measure maintain that such a currency would be no more elastic than that which is supplied under our present system. There is further criticism of the plan in respect to almost all of the points which its framers urged on its behalf. It is denied that it will lessen the strain on the National Treasury. It is held it will tend to increase the proportion of credit money, that it may cause contraction when expansion is needed, and that it offers opportunity for fraud. Space is lacking for the consideration of the opposing arguments on these points. The friends of the measure—and they include some well-known and able financiers—regard it as certain to put an end to the existing monetary evils.

Secretary Gage's Plan.—In the President's Annual Message of December 6, 1897, he urged strongly the need of currency reform, and gave a brief outline of a plan. But the plan outlined by the Secretary of the Treasury, Lyman J. Gage, contained the features of the President's scheme, and was far more carefully worked out. Mr. Gage's plan received the endorsement of the President.

The following outline of Secretary Gage's plan is taken from *Annals of the American Academy of Political and Social Science*, March 1898.

"1. *Issue and Redemption.*—Create separate division of treasury for issue and redemption of all kinds of government and paper money. Transfer to it \$125,000,000 gold, and silver dollars and bullion equal to outstanding silver certificates and treasury notes. Do not issue redeemed United States notes, treasury notes, or silver certificates except in exchange for the coin in which they are redeemed.

"2. *Refunding Plan.*—Authorize the issue of 2½ per cent. gold bonds, redeemable after ten years at option of the United States, to be exchanged on an equitable basis for the government 5's of 1904 and the 4's of 1907; also authorize an issue of \$200,000,000 of said 2½ per cent. bonds in addition to the amount needed for making said exchanges.

"3. *Banking.*—Limit the issue of bank-notes to capital. Lowest denomination \$10. Two kinds of circulation: the first secured by United States bonds of a par and market value equal to the face of the notes; the second unsecured and restricted in amount to 25 per cent. of the bonds deposited against the secured circulation. A bank must deposit bonds equal to 50 per cent. of its capital before notes may be issued.

"(a) *Deposit of Government Money.*—A bank, in lieu of bonds, may deposit as security for its notes, United States notes, treasury notes or silver certificates. But not more than \$200,000,000 of such government money can be so deposited, and the secretary may, at his discretion, substitute for it 2½ per cent. bonds, the money then becoming part of the general redemption fund.

"(b) *Redemption.*—Each bank to maintain in the Treasury a redemption fund equal to ten per cent. of its circulation. The notes to be redeemed at the Treasury

and at designated sub-treasuries. 'The faith of the United States is hereby pledged' to the prompt redemption of the notes.

"(c) *Safety Fund*.—Each bank to pay a tax of two per cent. per annum on its unsecured circulation; the proceeds to be a safety fund to reimburse the United States for redemption of unsecured circulation. It may be invested in government bonds.

"(d) *Miscellaneous*.—(1) A tax of one per cent. on circulation, except that issued against the deposit of government money. (2) Banks of \$25,000 capital to be permitted in places of 2,000 population or less. (3) Present law as to legal tender character of bank-notes not changed."

The Merits of the Gage Plan.—It will be seen from this that Secretary Gage's plan proposes to reform the currency without departing radically from the present system. The danger to the gold reserve would be averted, he thinks, by locking up the United States Treasury notes and silver certificates, and preventing their reissue except in exchange for the coin in which they are redeemed. Bonds are to be retained as the security for national bank-notes, but the national debt is to be refunded at 2½ per cent., and the issue of notes is to be made more profitable to the banks by the provision that notes may be issued up to the par value of the bonds deposited, and that an emergency circulation equal to 25 per cent. of the bonds, and taxed at the rate of two per cent. per annum, may exist along with the secured circulation. The establishment of a separate division in the Treasury for the redemption and issue of notes is a feature of both plans. This scheme appeals to the conservative men. The security remains ample, and undoubtedly the relaxation of the present rules in regard to the issuance of notes would increase the volume of bank currency. Bank-notes would take the place of a great part of the government credit money. \$200,000,000 in government notes and silver certificates may be deposited by the bank in lieu of bonds. After this, \$50,000,000 would be tied up in a redemption fund. These sums, together with the amount of bank-notes issued under the present system, bring the total to \$500,000,000, which would have to be replaced by the new notes. Secretary Gage estimates the reduction of the government's demand obligations at about \$500,000,000. The banks will step into the breach and supply the requisite currency, greatly lessening the strain upon the government. There will remain, according to Secretary Gage's reckoning, \$360,000,000 of government obligations. He thinks that the amount of government credit money being so greatly reduced there will be far less difficulty in maintaining the gold reserve. On account of the scarcity of government credit money the banks will be able to redeem in gold as easily as in government paper. This would be true if the exportation of gold bore an exact ratio to the amount of government paper money in circulation, but it is doubtful if it does. Some think that the exportation of gold depends rather on the inelasticity of the currency. If this latter view is correct, exporters would find no difficulty in obtaining gold, and the drain on the treasury would not be lessened. If, however, the secretary's plan renders the currency more elastic, the danger to the gold reserve will be lessened. The emergency circulation is of course designed to adjust the amount of issues to the needs of the trade. Its success would depend on the question whether it would really tend to expand in times of stringency, or contract in periods of inflation. If the security of the notes are such that they would be accepted from one end of the country to the other even when they are based merely on general assets, it is hard to see how they would show any greater elasticity than the present currency. The imposition of a tax, however, upon such emergency circulation, would tend to make it conform to the demands of business, if the tax were high enough to prevent the banks from resorting to emergency circulation under normal conditions. Whether 2 per cent. would accomplish this result is a question to be decided by experts.

The Teller Resolution.—The other plans for changes in the currency system do not require detailed discussion. President McKinley's proposal was confined to the facilitation of the maintenance of the gold standard. It consisted of the simple requirement that on the retirement of the greenbacks they should not be reissued except in exchange for gold. During the early part of 1898 there was considerable discussion in the Senate over the currency question, and an interesting but not very profitable debate was occasioned by the introduction of a resolution on Jan. 20, by Senator Teller, of Colorado. This resolution was as follows:—

"*Resolved*. By the Senate (the House of Representatives concurring therein), that all the bonds of the United States issued, or authorized to be issued, under the said acts of Congress hereinbefore recited, are payable, principal and interest, at the option of the government of the United States, in silver dollars, of the coinage of the United States, containing 412½ grains each of standard silver, and that to restore to its coinage such silver coins as a legal tender in payment of said bonds, principal and

interest, is not in violation of the public faith, nor in derogation of the rights of the public creditor."

The McCleary Bill.—The measures proposed by the Monetary Commission and Secretary Gage together with certain proposals made by Congressmen Walker and Fowler were laid before the Committee on Banking and Currency of the House of Representatives, which after considerable discussion submitted a bill to Congress on June 15. There being no hope of passing the bill through the Senate the friends of the measure withdrew it from further consideration. In the meanwhile the war with Spain had arisen and Congress was engrossed with pressing matters relating thereto. Some alterations in detail were afterwards made in the bill, but it is worth while here to consider some of the chief points in the original measure and especially some of the arguments urged for it in the accompanying report which was one of the most important statements on the currency question that has appeared in recent years.

Features of the Plan. "National Reserve Notes."—Among the provisions of the bill was one creating a new division of issue and redemption in the Treasury Department, this division to be under the charge of three comptrollers of the currency and to manage all affairs relating to the issue, redemption and exchange of currency whether coin, government notes, or bank notes. To this division should be transferred by the Secretary of the Treasury "all funds in excess of a cash balance of \$50,000,000 and all gold and silver coin and bullion not held in the Treasury for the purpose of redeeming United States notes, Treasury notes and certificates." Among the other important features of the measure are the provision for a new form of currency to be known as "national reserve notes" which shall take the place of the existing greenbacks with a view to relieving the government of the United States from the burden of redeeming its demand obligations. These national reserve notes are "government notes whose current redemption is provided for by the banks. They are a legal tender and are intended for circulation as currency or for use in the reserve of the banks in exactly the same manner as the existing greenbacks. National reserve notes are to be issued to any national bank to any amount not exceeding its paid up capital upon its surrender to the Treasury of an equal amount of greenbacks." The banks exchange these national reserve notes for United States notes which are thereupon cancelled and destroyed. There is to be a current redemption fund for the reserve notes and this is to consist of contributions from the note-issuing banks to the extent of 5 per cent. of the amount of their reserve notes in gold coin. Thus the government is relieved from the burden of the current redemption of its demand notes and at the same time the money in circulation is not reduced, for the greenbacks as they disappear are replaced by national reserve notes in equal amounts.

Elasticity.—In return for this service of the banks in redeeming the United States notes they have the privilege of issuing currency notes upon general assets and of enjoying a partial remission of a tax of $\frac{1}{4}$ of 1 per cent. each year levied upon the capital surplus and undivided profits of each bank. At the same time that any diminution in the existing amount of currency from the withdrawal of the government from the banking business is prevented by this device of the national reserve notes, the bill aims to secure elasticity of the currency by permitting the banks to issue notes based upon commercial assets without the deposit of United States bonds. Such notes, however, are not to exceed 40 per cent. of the paid up capital of the banks and can be issued only upon condition that bond-secured notes and national reserve notes be taken in equal amounts. The issuance of notes on the basis of bonds is to continue but the banks may issue notes upon bond deposits to the par value of the bonds instead of to 90 per cent. of the par value as at present. The committee gives the following illustration of the working of this plan: "Thus a bank organized under this bill having a capital of \$100,000, is required to take out \$25,000 in national reserve notes and to have on deposit in the Treasury \$25,000 of United States bonds, against which it may issue \$25,000 in national bank-notes. It may also issue \$25,000 additional in such notes based upon commercial assets, and may increase such issues if it increases also its bond deposits and its holdings of reserve notes in equal proportions. This process may be continued up to the point where the amount of notes secured by bonds, the amount of notes not thus secured, and the amount of national reserve notes are each equal to 40 per cent. of the paid-up capital, making an aggregate of \$80,000 in bank-notes and \$40,000 in reserve notes." A tax of $\frac{1}{2}$ of 1 per cent. each month may be imposed on notes issued in excess of 80 per cent. of the paid-up capital exclusive of issues of reserved notes. "But bond-based notes may be issued to the full amount of the capital without any tax on them." The redemption of the paper currency thus rests with the banks, which must redeem reserve notes over their own counters and maintain a 5 per cent. gold fund in the Treasury for the redemption of notes in gold. The government guarantees the ultimate redemption of these reserve notes in case the bank fails.

Alleged Advantages of the Plan.—Such are the main points of the bill as summarized by the committee in its accompanying report. The most striking feature of the

measure is the method of dealing with the greenbacks and in regard to this the report makes the following arguments:

"In dealing with the existing legal-tender notes of the government your committee have endeavored to adopt a system which would be subject to none of the criticism made against the issue of interest-bearing bonds or the taxation of the people for the payment of this demand debt. While the arguments are strong for the adoption of one of these methods of paying back to the creditors of the United States the money thus borrowed for the preservation of the Union, the system adopted is such as to continue to the government all the benefits of the loan without any of the disadvantages of its character as a demand obligation. The proposed bill places upon the banks the burden of providing for the current redemption of the greenbacks.

"The form of the proposition submitted by your committee makes that portion of the demand debt which is not now covered by gold in the Treasury a loan by the banks to the government. This loan is made without interest and without any compensation to the banks except what is afforded them in getting their franchise as national banks and thus securing the power to issue a banking currency, which is granted in other sections of the bill. There is no other profit or return to the banks in thus carrying the nation's debt, except a small remission of the new franchise tax.

"This policy is not without precedent in that of European governments, but the privileges granted by those governments are enormously greater, because they are granted to a single bank having a monopoly of all the note issues of the country. The Bank of France, for instance, makes the government a loan without interest, which has just been increased to 180,000,000 francs, or about \$35,000,000; but this loan is substantially offset by the deposit of the treasury with the bank, which amounted on January 7, 1898, to 212,268,560 francs, or 32,000,000 francs in excess of the entire sum advanced to the government. The government of Austria-Hungary has an advance from the Austro-Hungarian Bank amounting to about 75,000,000 florins, or \$30,000,000; but this is in process of annual reduction by the amount of the profits of the bank, charged as a government tax, but actually employed for the reduction of the loan. There are illustrations of several similar cases, but they serve to show that no country imposes so heavy a burden upon its banks as this bill provides, unless under the pressure of dire necessity, as in the cases of the governments of Spain, Portugal and Italy.

"The banks are required to redeem this debt of the government now assumed by them upon precisely the same terms as the current redemption of their own notes while they are conducting a solvent banking business. It is only when, by the refusal to pay such notes, they become insolvent, that the government recognizes again its demand debt and reassumes it for the complete protection of the holder of the note and for the benefit of the creditors of the bank by leaving the remaining assets unimpaired for the settlement of their just claims. The form of note thus assumed by the bank with the final redemption guaranteed by the government combines the strongest of all resources for its ultimate payment. The note which it is proposed to issue under this bill in lieu of the government notes is called the national reserve note, a designation which may be taken to imply at once that it has behind it not only the banking resources of the issuing bank, but the reserve strength of the national government, and also that it is peculiarly available for money reserves of all kinds. It is, moreover, a legal-tender note, whose parity with gold is assured so long as the banks maintain the parity of their notes, and for whose parity the government is also responsible, if it is conceivable that the government should maintain specie payments while the banks were unable to do so."

The Secretary's Report.—In his report on the state of the national finances submitted to Congress December 6, 1898, Secretary Gage took his stand firmly on the principles of the monetary bill before Congress. He made the following summary of the arguments for effective currency and banking reforms: "The power of the bank note * * * will always be restored in full upon the call of industry. The power of our present currency, on the contrary is not suspended. It is inevitably misdirected. It artificially stimulates speculative activity in securities at the centers. It periodically absorbs the credit powers at times when they should be made serviceable to the whole country. It ministers to the speculator, it prejudices the producer, the merchant, and the manufacturer, though, at last, all suffer from its deranging influences.

"These are the reasons, the most important reasons, why our banking system should be reformed and made effective to commercial and industrial needs; and these same reasons, with others not here set forth, call for the elimination, in a safe and proper way, of the injurious interference in our currency system by the legal-tender paper money of the government.

"If it be conceded that the legal-tender money issued by the government does not possess the qualifications to make it a proper factor in the country's exchanges of

products and manufactures; if the fact also be admitted that it is a deranging and disturbing factor in its relation to industry and commerce, then the time has come to substitute for it a currency which will adequately, economically, and safely meet the ever-growing needs of the country, rapidly developing, as it is, in the power of production, in the number of its people, and the importance of its domestic and foreign trade.

"The total circulation of failed banks outstanding at the time of failure, up to Oct. 31, 1897, was \$20,893,827. The loss upon these notes, if the security for them had been impaired in the same degree as the security for other liabilities, would have been \$5,379,165, or an annual average of about \$163,000. This loss would have been made good by a tax of about one-twelfth of 1 per cent. per year upon the circulation of the solvent banks. A tax of one-fifth of 1 per cent. upon the average circulation of the National banks since the foundation of the system would have paid such losses up to Oct. 31, 1897, amounting to \$5,379,165, and left a surplus of about \$9,000,000 in the guaranty fund.

"Whether preference be given to the note holder, as in Canada, or he be made to take his share of the risk with the depositor, as in Germany, France, and Scotland, or whether the note holder shall be protected by the special pledge of security as now provided in our National Banking act, these considerations affect the questions relatively, not absolutely. Under either of these conditions provisions may be made which will furnish to the country a paper money adequate to commercial needs, economical to the people, and safe in its general workings.

"In the nature of things the banker is the proper agency for operating this important function. He must have motive for his action or he will not exercise it. Given this motive he will, like the laborer, the merchant, or the professional man, be diligent in the employment of his powers. That this motive must be the motive of gain does not differentiate the bank from other working forces of society, whose actions are healthful and helpful to the social whole.

"In my last report I ventured upon specific recommendations. These recommendations, if adopted and formulated into law, would, in my opinion, be curative of the evils herein pointed out. In House Bills Nos. 10,289 and 10,333 are embodied a series of measures in some respects more meritorious. The measures therein proposed are the result of careful study by expert and experienced men. With some modifications—the reasonable fruit of full discussion—they would, I believe, meet the country's needs. I commend the subject to the early and earnest attention of Congress."

American Economic Association's Report.—The last important contribution to the discussion of the currency question during the year was the following report of the Currency Committee of the American Economic Association at the latter's annual meeting on Dec. 27-29, 1898.

"*I. The Need of Reform.*—Despite the fact that much improvement has taken place within two or three years, there still exists a real need for monetary and banking reform in the United States. The standard of value upon which the whole system rests is by no means as secure as it should be. The circulating note system is still greatly lacking in elasticity. Adequate banking facilities for newer, or more backward, districts are still wanting. In the system as a whole, there is a notable lack of unity and organization.

"In citing the first particular, *i. e.*, the insecurity of the monetary standard, as a proof that currency reform is needed, your committee do not mean to imply that the existing standard is the only possible one, or even the most desirable one. It is merely assumed that, so long as that standard is retained, it should have the utmost possible security; since the unquestioned security of the monetary standard is indispensable to a high degree of industrial prosperity.

"It is possible, however, to argue that the defect in question no longer exists—that the stability of the gold standard is now substantially assured. There is unquestionably much force in this contention. Besides a number of temporary circumstances, such as a full treasury, a large gold reserve, and a favorable trade balance of exceptional amount, several changes of a more permanent character have contributed to the improvement of the situation. We cite particularly the repeal of the provision in the act of 1890 to issue Treasury notes in purchase of silver, and the insertion in the war-revenue bill of a clause which authorizes the Secretary of the Treasury to make loans at his own discretion to meet temporary deficits. In fact, under the laws now in force, a Secretary who desires to maintain the gold standard need have no difficulty in doing so. But this is only one side of the case. It is equally true that, because of inconsistencies in these same laws, it is possible for a Secretary so disposed to overthrow the gold standard, even though it continue to be the declared policy of the nation to maintain that standard. There thus remains in the situation an element of uncertainty which is needless and which cannot but prove harmful.

"As respects the need for elasticity in the note system, next to nothing has been gained. In the first place, we still retain for our bank circulation the system of bond security, and under that system it is in the nature of the case extremely difficult, if not impossible, to secure in the currency that prompt and easy adjustment of volume to need which constitutes genuine elasticity. In defence of this statement, much might be said, but it may suffice to call attention to a single consideration. If bank circulation is to be elastic, the assets which are required as a security for that circulation must be such as a bank ordinarily has in its possession; since, in a stringency when expansion is needed, the bank already has its resources locked up, and consequently cannot without great difficulty get hold of new assets. But government bonds are not a kind of assets which banks will, or usually ought to, have on hand in considerable amounts. The special office of banks is to provide funds for the everyday business of the country, *i. e.*, to invest their resources, not in a supply of bonds to furnish the basis of a possible issue of notes, but in commercial paper, grain bills, and the like. As a result of all this, the amount of notes which, under our system, most banks issue, is that amount which can be kept in circulation substantially all of the time. Fluctuations in the need for such notes, there is almost no attempt to meet.

"In the second place, we have not attained in our circulation even that degree of elasticity of which a bond secured system is capable. At the outset, we disregard the fundamental principle that, in order to be elastic, a circulation should be profitable. That this is a fundamental principle needs little proof. The necessity of profitability to secure expansion is self-evident. In securing contraction, on the other hand, profitability, if less necessary, is not less effective; for, in making each banker anxious to expand his own circulation, it leads him promptly to send home the issues of his neighbors in order to make room for his own. Thus, from the single fact that the circulation is fairly profitable are derived two opposing forces which work respectively for the expansion and for the contraction of the currency as a whole. Further, the relative strength of these opposing forces is largely determined, as it should be, by the needs of business. If more notes are wanted in the ordinary circulation, they will be swifter in going out, and, since they will not naturally get into the hands of bankers, slower in being sent home to the issuer. If, on the other hand, fewer notes are needed, they will be slower in going out and more prompt in coming back; since, when idle, they will naturally accumulate in the banks and by them will be sent home. It is thus evident that a reasonable degree of profitability is a most important requisite of an elastic currency. Now it is a commonplace that our bank circulation is not a profitable one. Most banks deposit bonds to the least amount permitted by law, and do not always issue even the quantity of circulation corresponding thereto. It is true that conditions have in this respect measurably improved, the lower price at which bonds are now available having rendered the conditions of issue somewhat more profitable; but it is practically certain that this process has not been carried sufficiently far to furnish the necessary conditions for an elastic currency.

"But again, even an increase in profitability cannot avail unless the machinery of issue and redemption is efficient. The forces which work respectively for expansion and contraction must have easy and unimpeded action. At this point our present law is not only inadequate, it is positively evil. It limits the amount of circulation which may be retired during any one month, and prohibits reissue for six months after retirement, thus actually putting a premium on inelasticity. Further, the machinery of issue and redemption is unnecessarily slow and clumsy. Even if a bank decides to expand its circulation, the process can seldom be completed till the special need has passed. In like manner, contraction cannot usually be brought about till long after a plethora has worked much harm.

"The foregoing remarks have more especial reference to the experience of ordinary times; for the case of the monetary panic, when there arises a demand for an immediate and very great increase in the stock of current moneys, absolutely nothing has been done. We thus have every reason to expect that, should another crisis as serious as that of 1893 overtake the nation, we should experience a monetary famine of equal severity and should again be obliged to resort to numerous extemporized devices very doubtful as to their legality and still more doubtful as to their efficiency.

"What has been said concerning the continued lack of security and elasticity applies in substance to every other recognized need of the monetary system. Almost no progress has been made. It thus becomes evident that the only method by which we can insure that, when less favorable conditions arise, there shall be no recurrence of the disasters formerly experienced, is to bring about some more or less fundamental changes in the monetary system itself.

"II. *The Security of the Standard.*—Under existing conditions, the only wise and consistent policy for the United States is the frank recognition of the fact that the actual monetary standard is now, and for some time to come will be, gold, and the adoption of legislation which shall insure the entire stability of that standard, until

such time as the nation may have decided to establish some other. Assent to this statement does not commit any one to the position that the gold standard is, abstractly considered, the most desirable one. As is well known, a large number of economists hold to the opposite opinion. But, as is also well known, the particular substitute which such economists favor, *i. e.*, international bimetallism, is at present, and for a long time will be, out of the question. In consequence, the precise form which the question of standards now takes in the United States is as to whether the currency shall rest on a gold basis or on a silver or paper basis. Thus stated, it can have, to the majority of economists, but one solution. Under existing conditions, the gold standard is, for the United States, the best available. This being the case, it is the duty of the nation to render that standard as stable as possible and to remove all uncertainty as to its maintenance and its easy working; for uncertainty as to the basis of the currency must always be a menace to prosperity.

"With respect to the means through which increased stability for the standard shall be insured, it is hardly to be doubted that much would be gained by its explicit definition in terms of gold. Still more important would be the enacting of such legislation as shall insure that the task of maintaining the standard, or, in other words, of maintaining the convertibility into gold of other forms of currency, shall be efficiently performed. At this point, your committee find themselves in accord with the commonly received opinion that, under normal conditions, the task in question can most advantageously be devolved upon some institution or institutions of a banking nature. We are also agreed, though perhaps less positively, that, even under the conditions which must prevail in the United States, this same solution of the problem is, on the whole, best. If, however, this plan shall prove impracticable—if the task of maintaining the standard of value is still to rest upon the Treasury—everything calculated to make that task an easier one should be done, and the department should be specially organized with reference to the duty thus devolving upon it, and provided with such additional powers as are necessary to insure its fitness for the work in hand. Among the various changes which would tend to the accomplishment of these objects, your committee believe the most important to be some modification of the existing system whereby the duties of the Treasury as respects the management of the monetary system of the country shall be separated from those functions which are of a purely fiscal nature. It would doubtless be well, also, to find a place for silver where it will cause least trouble, by retiring all notes under ten dollars, and to authorize the Secretary to withdraw, at least temporarily, United States notes which have been once redeemed.

"*III. The Banking System. (a) Elasticity.*—Whatever decision may be reached with reference to the much disputed question as to whether United States legal-tender notes shall continue to hold their place as part of the paper currency of the country, it is certain that the maintenance of some system of bank issues will be indispensable. This system should, without doubt, be under Federal control and should take such form as to insure much greater elasticity than exists in the present system provided always that the security of the issue shall be in no wise impaired.

"As respects the method to be employed for attaining this needed increase in elasticity, it is believed that the really successful one must involve issuing some portion of the circulation upon ordinary banking assets. The chief reason for this, as already indicated, is that such ordinary banking assets are the only ones which are universally and readily available when expansion is needed. The superiority of such a system is further insured by the fact that there is a very close correspondence between the amount of such assets in the possession of the banks and the need of the community for currency; since these assets, like the need for money, vary in amount with the volume of business. As respects the security of such notes, there need be no anxiety, provided the system is supplemented with the device of a safety fund, or with one or more of the various other expedients which have been proposed. If it be urged that nothing can make this system really safe, at least for the banks considered as guarantors of each other's notes, so long as the securities on which these notes are based remain in the custody of the issuing bank, the objection might be met by enacting that notes of this character shall be issued only through clearing-house associations, which are to hold in trust the commercial paper or other collateral by which the notes are secured, just as they now do in the case of loan certificates, and as the Treasury of the United States does in the case of national bank-notes.

"It may, however, prove impossible to secure legislation of the character described. In such event the existing system of notes based on United States bonds should be amended so as to give to it as large a measure of elasticity as is possible. The provisions of the law of 1882 which limits the amount of notes that may be retired in any one month and prohibits reissue within six months after retirement should be repealed. To secure in some degree that increase in profitableness which, as we saw earlier, is indispensable to elasticity, it would be well to raise the ratio of notes to bonds deposited and to lower the tax, or, better still, to levy it on capital and surplus.

In order still further to enlist the self-interest of the banks, especially on behalf of the prompt retirement of redundant notes, we should be inclined to prohibit any bank from paying out the notes of any other bank except to the issuer or to the redemption agency. As respects making easier the processes of expansion and contraction, some gain would result from requiring the Comptroller to keep on hand a supply of notes in blank, and still more from an increase in the facilities for redemption.

"In order to furnish the sort of elasticity which is needed in a panic, it is even more necessary than in ordinary times to depend on general banking assets for the security; since at such times few banks have any resources left with which to purchase government bonds. To insure that some portion of the power of issue should be reserved for such occasions, as also to secure its prompt retirement after the special need has passed, there is probably no better expedient than that already tried in Germany, *i. e.*, levying on such circulation a tax so high as to be in ordinary times prohibitive. It would seem that the natural way to apply this general plan both safely and effectively would be to intrust its elaboration and management to the Clearing-house Associations, which have already worked out an analogous scheme in the loan certificates that have done much service in former crises.

"(b) *Country Banking*.—As already remarked, there is a real need for increased banking and currency facilities in the newer or more backward parts of the country, and legislation could do something towards satisfying this need. In the judgment of your committee, the most effective as well as the safest expedient for accomplishing this object is some system of branch banking so constructed as to supplement, but not displace the present system of independent banks. Under such a plan, banking facilities can be furnished to communities too small to support even the smallest independent bank of issue, and capital can be most cheaply and easily transferred from districts oversupplied to those needing it; while, at the same time, the dangers of fraud or mismanagement incident to all banking are far less serious than under a system of small independent banks. There are doubtless objections to the plan, but the experience of other countries has shown that they are not of great moment.

"If, however, the apparent tendency towards excessive concentration of capital shall prove too strong an objection to this system, other alternatives offer themselves. A decision to permit the issue of any portion of the circulation upon general assets would greatly increase the banking facilities of the country districts, since the chief obstacle at the present time to the establishment of national banks of issue in such districts is to be found in the circumstance that they could not afford to invest their capital in assets so unproductive as United States bonds. Another but rather more doubtful remedy for the difficulty in question would be the exemption from the Federal ten per cent. tax on circulation, of such State banks as should comply with the regulations of Federal law and submit to Federal supervision. This change would, without doubt, greatly increase banking facilities, and, probably, it would prove quite safe. Again, a lowering of the minimum capital for a national bank from the present figure to twenty or twenty-five thousand dollars would be better than nothing, and would probably work no evil effects of any moment.

Conclusion.—In conclusion, your committee cannot refrain from expressing the conviction that it will be a genuine misfortune if the very notable movement towards monetary reform, which has filled so large a place in the history of the last few years, shall pass away without having left any results in legislation. Never before has there existed among all classes so great an interest in this subject, so near an approach to unanimity of opinion, and so strong a purpose to see something accomplished. To this very promising attitude of the public mind, are added external conditions of an extremely favorable character. We allude to the exceptionally large stock of gold, both in the Treasury and in the country at large, to the unprecedented trade balance, to the generally solid condition of business, to the absence of any necessity for that haste which makes legislation in a crisis dangerous. A conjuncture in so many respects favorable we can scarcely hope to meet again in the near future. Its utilization would, therefore, seem to be commended by every consideration of prudence and good judgment.

"Without doubt, there are still considerable obstacles in the way of reform. It is easy, however, to exaggerate the seriousness of those obstacles. Your committee wish particularly to remark this in respect to the much-noted divergencies of opinion among friends of reform. The not uncommon opinion that these divergencies are so serious as to render hopeless the prospects of reform, we consider quite unwarranted. As a matter of fact, barring differences due to the circumstances of some being more, others less, radical, the various projects of reform have a surprising similarity. Doubtless there are differences of method so fundamental that the choice of one plan involves the rejection of its rivals; but cases of this sort are comparatively few. An analysis of a large number of plans of reform discloses the fact that, of the various expedients proposed in them for accomplishing the several objects sought, a considerable proportion appear in nearly every one of the plans.

"In the light of these facts, your committee are of the opinion that what is most needed at this juncture is a disposition on the part of the friends of reform to sink individual preference as to details, and to insist that Congress shall enact such legislation as it may be possible to agree upon. Undoubtedly there is room in this matter of currency reform for honest differences of opinion, but such a degree of persistence in one's opinion as makes a working compromise impossible has no justification in monetary principles, or in the conditions prevailing in the United States. It is safe to say that, of the five or six currency bills that, during the last twelve months, have been in any serious sense before the country, the passage of any one would have resulted in great improvement, and would have measurably satisfied the demands of reformers."

For further discussion of currency matters see the articles BANK—BANKING, BI-METALLISM, UNITED STATES, RUSSIA, INDIA, JAPAN, and other countries; also the table following the article MONEY.

CURRIER, MOODY, ex-Governor of New Hampshire, died in Manchester, August 23, 1898. He was born in Boscawen, New Hampshire, April 22, 1806. After his graduation at Dartmouth College in 1834 he taught school and studied law, and was admitted to the bar in Manchester in 1841. In 1843-44 he was a Democratic State Senator. He soon became prominent in financial circles and in 1864 was made president of the Amoskeag National Bank. The slavery question led him to join the Republican party, and when the war broke out he performed valuable service in raising and equipping troops. He was a presidential elector in 1876, and an unsuccessful candidate for Governor in 1882; but in 1884, he was elected by a large majority. Mr. Currier was always interested in religious and educational institutions, and never discontinued his literary and scholarly pursuits.

CURZON, GEORGE NATHANIEL, M. A., Lord of Kedleston, Viceroy of India, was born at Kedleston, Derbyshire, January 11, 1859. He is the son of Lord Scarsdale; he was educated at Eton and at Balliol College, Oxford. In 1885 he became assistant private secretary to the Marquis of Salisbury; from 1886 to 1898 he was a Conservative Member of Parliament from the Southport Division S. W. Lancashire. In 1891-92 he was Under-Secretary of State for India; from 1895 to 1898 he was Under-Secretary of State for Foreign Affairs, and in the former year was made a Privy Councillor; upon his appointment to the viceroyalty in 1898, to succeed Lord Elgin, he was raised to the peerage. The appointment was looked upon with some disfavor both by Indian natives and by the Russian government. The latter regards Lord Curzon as an Englishman who is particularly opposed to Russian advance. Adverse comment also arose in England; it will not do, however, to prophesy disaster to his administration, for he has shown great political sagacity and ability. He is a progressive man and a supporter of the "forward" policy; his appointment was taken as a sign that a vigorous policy would be adopted in the East. Lord Curzon has traveled widely in Central Asia, Afghanistan, the Pamirs, Persia, Siam, Indo-China, and Corea. In 1883 he received the Lothian essay prize at Oxford and in 1884 the Arnold essay prize; in the former year he was made a fellow of All Soul's College, Oxford. The gold medal of the Royal Geographical Society was awarded him in 1895. Lord Curzon has published the following works: *Russia in Central Asia*, 1889; *Persia and the Persian Question*, 1892; *Problems of the Far East*, 1894. He married in 1895 Miss Mary Victoria Leiter, daughter of Mr. L. Z. Leiter, the Chicago financier.

CYCADACEÆ. See BOTANY (paragraph Spermatozoids in Gymnosperms, etc.).

CYPRUS, which is one of the largest islands of the Mediterranean, lies 41 miles from the coast of Syria. It is now a dependency of Great Britain, having been granted to her in 1878. It has an area of 3,584 square miles with a population in 1891 of 209,286. Its capital is Nikosia with a population of 12,515. Agriculture is the chief occupation and there is a considerable exportation of the products of the soil. The island is said to have derived much advantage from the English rule. Its foreign trade is considerable, and the shipping, entering and clearing at its ports has increased in recent years. The revenue, which is derived chiefly from tithes, customs duties, excise, stamps, etc., has been for many years steadily in excess of the expenditure. The executive authority is entrusted to a British High Commissioner aided by an executive council and legislature of 18.

CYTOLOGY (VEGETABLE). See BOTANY (paragraph Cytology).

CYRANO DE BERGERAC. See ROSTAND.

CZECHS, a branch of the Slavonic race, who settled in Bohemia and Moravia about the middle of the fifth century A. D., having migrated thither from the north-east. They still constitute by far the great majority of the population of those provinces. Besides the Bohemians and Moravians, the term Czech includes the Slovaks

who occupy the northwest part of Hungary and there are other Czechs gathered in communities in several parts of the crown-lands. According to the enumeration of 1890 the Czechs in the Austro-Hungarian monarchy numbered 7,410,388 of whom 3,644,188 were in Bohemia, 1,590,513 in Moravia, 1,937,517 in Hungary, 129,814 in Silesia, and 93,481 in Lower Austria, etc. They have preserved their racial spirit which in late years has been the cause of much political disturbance in the affairs of Austria-Hungary. For an account of the part which they have played in the recent history of political parties see the articles AUSTRIA-HUNGARY and BOHEMIA.

DAHLGREN, Mrs. MADELINE VINTON, a literary and society woman of Washington, died in that city May 28, 1898. She was born about 1835 at Gallipolis, Ohio. In 1859 she published sketches and poems under the pen name "Corinne" and subsequently she used the name "Cornelia." At an early age she married David Convers Goddard, of Zanesville; Mr. Goddard died and in August 1865, his widow married Admiral Dahlgren. Her greatest literary activity began after the Admiral's death in 1870; during the succeeding years she actively opposed the woman's suffrage movement. She was one of the founders of the Literary Society of Washington and for a number of years was President of the Ladies' Catholic Missionary Society of that city. Her writings on social and general topics were more successful than her poetry or fiction. Her book on official etiquette has long been a standard authority. Among her works are: *Idealities*, 1859; *Thoughts on Female Suffrage*, 1871; *South Sea Sketches*, 1881; *The Social Official Etiquette of the United States*, 1881; *A Washington Winter*, 1882; *South Mountain Magi*, 1882; *Memoirs of John A. Dahlgren*, 1882; *Lights and Shadows of Life*, 1886; *The Lost Name*, 1886. She translated the following works from the French, Montalembert's *Pius IX*, and De Chambrun's *Executive Power*; from the Spanish, Donoso Corte's *Catholicism, Liberalism, and Socialism*.

DAHOMEY is a West African dependency of France on the Gulf of Guinea between the British Gold Coast and the Niger territories. It comprises two distinct divisions, namely the native kingdom of Dahomey, a French protectorate, under the direct government of a native prince, with a population of about 150,000, and the colony of Dahomey, comprising the Benin settlements on the coast with a population of about 400,000. The Benin settlements have been united for administrative purposes with French Guinea (q. v.) but are under the direction of a local governor resident at Kotonu. The total area of Dahomey is about 14,000 square miles. The people are said to be industrious and the products exported include palm oil, maize, cattle, ivory and India rubber. The capital is Abomey. The kingdom was one of the most important states on the slave coast in former years but French activity has resulted in a curtailment of its territory as well as of its power. In 1892 the French came into conflict with the King of Behanzin and having invaded his country and defeated him placed the present ruler, Guthili, on the throne. In 1893 the French declared the kingdom a protectorate with the exception of certain divisions which were formed into a colony and afterwards united administratively with French Guinea. In 1897 and 1898 the back country of Dahomey was the seat of conflicting claims on the part of France, Germany, and England. The delimitation of the French and German spheres in this region was accomplished by a convention between France and Germany signed on July 23, 1897. By this France obtained a far wider though less productive tract of land than Germany. Here, as is generally the case with territorial disputes in Africa, the question was complicated by the sharp practice of the native chiefs who made treaties simultaneously with both powers or laid claims to a wider extent of territory than they had a right to. With Great Britain the dispute took on a more serious character. Each country declared that the other had been the aggressor and at one time French and English troops were facing each other in the hinterland with a prospect of collision at a very early date. From the French point of view the Niger Company had no just claim to this territory in the treaties which it had made with the native chiefs. The especial point in dispute was the possession of the pagan kingdom of Bussa whose capital of the same name had been occupied and garrisoned by a French force. This town lies in the hinterland of the British dependency of Lagos and it was claimed by the Niger Company that treaties with the native chiefs covered this entire district. Nevertheless the French advanced into it and finally a French officer stationed himself at Bussa in the capacity of a French resident. By the close of the year 1897 it was evident that a conflict could be averted only by an international commission for the claims of the two powers were irreconcilable in principle. See the article NIGER TERRITORIES.

DAMES OF THE REVOLUTION, an organization established in 1896, consisting of members who are descended from an ancestor who contributed in any way towards the establishment of American independence during the War of the Revolution, 1775-1783. President, Mrs. Edward Paulet Steers; Vice-President and Registrar, Mrs.

Montgomery Schuyler; Second Vice-President, Mrs. John F. Berry; Secretary and Historian, Mrs. Mary A. Phillips, 19 W. 38th street, New York; Treasurer, Mrs. J. Wesley French, and Librarian, Mrs. Francis E. Doughty.

DAMS. The largest dam under construction in this country and probably in the world, is now being built to form an immense storage reservoir for the water supply of New York City. It is known as the New Croton dam, because it is located on the Croton river, a few miles below the original Croton dam. At its highest point this dam when completed will be 290.8 ft. high and 216 ft. thick at the base. This portion is of solid masonry and will decrease in height and thickness each way from the point of maximum cross-section. The length of the masonry portion, measured along the top, will be 700 ft. To the south of this the dam will be continued as an earth structure, about 500 ft. long, with a masonry wall in the center. To the north, the dam turns nearly at right angles to the main structure and extends 1,050 ft. upstream, its top being enough lower than the main dam to allow waste waters to spill over the top of this section—hence the name spillway, or wasteway. The contract for the dam was awarded in the summer of 1892. Some four years or more were required to do the necessary preliminary work of diverting the river and excavating for the foundations before the contractor could begin to lay stone on the dam proper. At the close of some six years of work the main dam had been brought up, in the highest places, only to the original level of the bed of the river. The contract price for the dam was about \$4,150,000. It will form a reservoir some 18 miles long containing 32,000,000,000 gallons of water, and entirely submerging the old Croton dam and part of the old Croton aqueduct. The chief engineer of the dam is Mr. Alphonse Fteley, of New York City.

Cross-Section of the New Croton Dam.
(From *Engineering News*.)

Steel has recently been used in dam construction in California and Arizona. In the Lower Otay dam, built 22 miles S. E. of San Diego, Cal., by the Southern California Mountain Water Co., of San Diego, a 14,000,000,000 gallon reservoir is formed by a dam 130 ft. high and 545 ft. long on the crest, composed of loose rock or stone filling, with a vertical core, or diaphragm. The plates range from about $\frac{1}{3}$ to $\frac{1}{4}$ in. in thickness. To protect the plates from rusting they were painted with semi-liquid asphalt and to guard them against damage from the rock filling a thin wall of cement mortar was built up each side of the plate. Water will not be allowed to discharge over the top of the dam, but will be carried in a wasteway constructed at one side, whenever any is to be wasted.

The Arizona dam is built entirely of steel, except for masonry abutments at each end. It was built by the Atchison, Topeka & Santa Fé Ry. Co. to supply its engines and incidentally to furnish water to the village of Ash Fork, Ariz., near which it is located. It forms a reservoir of 36,000,000 gallons capacity. The steel portion of the structure is 184 ft. long at the top and its greatest height is 46 ft. It consists of a series of triangular steel frames, against the upper sides of which rest the riveted steel plates, $\frac{3}{8}$ in. thick, which hold the water back. These plates are curved so as to form a series of channels from the top to the bottom of the inclined face of the dam, with flat strips between. The two masonry abutments have a combined length

of about 116 ft. Water will flow over the top of the steel dam. This form of dam was suggested and designed by Mr. F. H. Bainbridge, of Chicago, under the direction of Mr. James Dun, Chief Engineer of the A. T. and S. F. Ry. Co.

DANUBE, NAVIGATION OF THE. Great improvements have been made in the navigation of the Danube in recent years. On September 27, 1896, the new passage through the Iron Gates was formally opened. It will be remembered that the navigation is under the direction of a mixed commission composed of representatives of the riparian powers. The European Commission which has charge of the improvements of the navigation of the Danube, decided on May 9, 1898, to straighten the channel of the Sulina branch by a cutting five miles long, 400 feet wide, and 20 feet deep. This commission was formed in accordance with the Peace of Paris in 1856 and its work in improving the Lower Danube has resulted in greatly facilitating the navigation of that portion of the stream. The improvements proposed in 1898 would, it was estimated, be completed in five years. The river is already navigable by vessels of 3,000 tons burden between the ports of Braila and Galatz. In September 1898, it was reported that the canal at the Iron Gates would be free to navigation without tolls till further notice. In 1897 a monopoly was granted to a German firm by the Servian government, including the right to use the cataracts of the Danube for water power and to work mines and quarries along the banks. In the autumn of 1898 it was reported that this German firm had suspended its operations pending an inquiry to be made into the Servian concession, the Hungarian government having objected to the contract.

DARFUR, with an estimated area of 200,000 square miles and an estimated population of 1,500,000, is one of the provinces of the Soudan which after the Mahdi's revolt was lost to Egypt. It was reduced by Ziber Pasha in 1874, but after the Mahdist rebellion appears to have asserted its independence. It lies on the frontier of Wadai, and its capital is El Fasher. It is within the area claimed by Great Britain according to agreements with Germany and Italy in 1890 and 1891, and the British claim is further strengthened by Great Britain's position in Egypt as a guarantor of the restoration to the latter power of her authority over the lost provinces of the Soudan.

DARTMOUTH COLLEGE, at Hanover, New Hampshire, chartered in 1769, is Congregational and for men only. Connected with the college proper are the medical school and the Thayer school of civil engineering. In 1898 there were about 80,000 volumes in the library. The officers of instruction of the college, the medical school, and the engineering school numbered for the year 1898-99, 59; the students numbered in the college, 581; in the medical school, 131; in the engineering school, 11; total, deducting names inserted twice, 697. The academic and medical courses are four years in length, and the engineering course two years. The degrees conferred in 1898 were as follows: B. A., 37; B. S., 21; B. L., 11; C. E., 5; M. D., 24; M. A., 4; Ph. D., 1; D. D., 2; LL. D., 1. President since 1893, William Jewett Tucker, D. D., LL. D.

DATE LINE, INTERNATIONAL. See INTERNATIONAL DATE LINE.

DAUGHTERS OF THE AMERICAN REVOLUTION. Organized Oct. 11, 1890, in Washington, D. C., in which city are its headquarters. The members are any women who can prove descent from an ancestor who "with unfailing loyalty, rendered material aid to the cause of independence as a recognized patriot, as soldier or sailor, or as a civil officer in one of the several Colonies or States, or of the United Colonies or States." Regents preside over the State chapters existing in 44 States and Territories, and the District of Columbia. The membership is about 25,000. President General, Mrs. Daniel Manning; First Vice President, Mrs. A. G. Bocket; Secretaries-General, Mrs. Albert Ackers, Nashville, Tenn., and Mrs. Kate K. Henry, Washington, D. C.

DAUGHTERS OF CUBA, a patriotic society of women, organized in 1895, for promoting Cuban Independence. Membership, 100. President, Mrs. Gonzalo de Quesada; Secretary, Miss C. Mantilla. Headquarters, 116 W. 64th street, New York.

DAUGHTERS OF THE CINCINNATI, a woman's society corresponding to the Sons of the Cincinnati (q. v.), founded in 1894. Mrs. Howard Townsend, President; Mrs. Morris P. Ferris, Secretary, Dobbs Ferry, New York.

DAUGHTERS OF THE HOLLAND DAMES, founded to collect and preserve historical documents and to honor the memory of the early Dutch period in America. The members are descendants of "ancient and honorable families of New York."

DAUGHTERS OF THE KING, THE, an organization older than the King's Daughters (q. v.), being founded in 1885. It is distinctively Episcopalian, being more of an order than a society, and corresponds somewhat to the Brotherhood of St. Andrew (q. v.), as its purpose is "the spread of Christ's Kingdom among young women." President, Mrs. E. A. Bradley; Secretary, Miss Elizabeth L. Ryerson.

DAUGHTERS OF THE REVOLUTION, organized in New York in 1891. Membership is restricted to women who are lineal descendants of an ancestor who was a military, or naval, or marine officer, soldier, sailor or marine in actual service under the authority of any of the thirteen Colonies or States, or of the Continental Congress, and "remained always loyal to such authority, or descendants of one who signed the Declaration of Independence, or of one who as a member of the Continental Congress or of the Congress of any of the Colonies or States, or as an official appointed by or under the authority of any such representative bodies, actually assisted in the establishment of American independence by service rendered during the War of the Revolution, becoming thereby liable to conviction of treason against the government of Great Britain, but remaining always loyal to the authority of the Colonies or States." President, Mrs. Harry S. Snow, Brooklyn, N. Y.; secretaries, Mrs. L. Holbrook, New York, and Miss Virginia S. Sterling. Headquarters, 156 Fifth avenue, New York.

DAVENPORT, FANNY LILY GIPSY (Mrs. Melbourne MacDowell), actress, died of enlargement of the heart at her summer home in Duxbury, Massachusetts, September 26, 1898. She came of a histrionic family, her father being the well-known actor, Edward L. Davenport. She was born in London, England, April 10, 1850, was educated in the public schools of Boston, Mass., and in childhood determined to make a livelihood on the stage. Her first public appearance was in 1862 and, according to her own statement, she supported herself from the age of fourteen. Her career was marked by steady progress until she became, under the management of Mr. Augustin Daly, one of the foremost American actresses in high comedy. Later she achieved much success in "emotional" rôles, among the most important of which were "Fedora," "Theodora," "Cleopatra," and "Camille." It was upon these and other serious rôles that her reputation for the last twenty years of her life was based; many critics, however, maintain that she would have been even more successful had she kept to her earlier style in comedy. Her genius, like that of her father was certainly very versatile; in the course of her career she appeared in almost every kind of legitimate drama, including the Shakespearean comedies. Miss Davenport was a woman of great personal attraction, and to this fact her popularity was doubtless in part due; her art was high, but not of the highest order. During her long connection with Mr. Daly's company she was associated with many of the most famous American actors. She left the management of Mr. Daly in 1878 and subsequently began a series of starring tours. She was married in 1879 to actor Edwin F. Price, from whom she was divorced some ten years later; she soon married Mr. Melbourne MacDowell, who survives her.

DAVIES, SIR LOUIS HENRY, M. P., K. C. M. G. (created 1897), Canadian Minister of Marine and Fisheries, was appointed a member of the Anglo-American Joint High Commission which was created in May, 1898. (See CANADA, paragraphs History.) He was born in Charlottetown, Prince Edward Island, May 4, 1845; was educated at Prince of Wales College; became a barrister in 1867; Solicitor-General for Prince Edward Island, 1869, and 1871-72. In the assembly he was leader of the opposition, 1873-76, and during the next three years was Premier and Attorney-General. He became Queen's Counsel in 1880; two years later was elected to the Dominion House of Commons and has since been continuously returned. In 1877 he was counsel for the British government before the International Fisheries Arbitration at Halifax between the United States and Great Britain. He has been prominent in educational matters.

DAVIS, Colonel CHARLES W., Commander of the Loyal Legion, died in Chicago, Illinois, December 16, 1898. He was born at Concord, Massachusetts, October 11, 1833; served in the Civil War as adjutant of the Fifty-first Illinois Infantry, rising by successive promotions to the rank of colonel in May 1865; he took part in the engagements at Island No. 10, Corinth, the Cedars, Chickamauga, and Missionary Ridge, where he was severely wounded. Colonel Davis accepted the surrender of General M. J. Thompson in Arkansas.

DAVIS, CUSHMAN KELLOGG, Republican United States Senator from Minnesota, was born at Henderson, Jefferson county, New York June 16, 1838; was graduated at the University of Michigan in 1857; studied law. In the Civil War he served as a first lieutenant in the Twenty-eighth Wisconsin Infantry, 1862-64; was elected to the legislature of Minnesota in 1867 and from 1868 to 1873 held the office of District Attorney. In 1874-75 he was Governor of Minnesota, in 1887 succeeded S. J. R. McMillan in the Federal Senate, and was re-elected in 1893. When John Sherman retired from the Senate to become Secretary of State, March 5, 1897, Mr. Davis was appointed Chairman of the Foreign Relations Committee. On August 26, 1898, President McKinley appointed him one of the five commissioners to negotiate a treaty of peace with Spain.

DAVIS, Miss VARINA ANNE ("WINNIE"), the "Daughter of the Confederacy."

died at Narragansett Pier, Rhode Island, September 18, 1898. She was a daughter of Jefferson Davis and was born in the Southern White House, Richmond, Virginia, June 1864. She had no small ability as a musician and painter, and gained some reputation as an essayist and story writer. Among her writings are: *An Irish Knight of the Seventeenth Century*; *The Veiled Doctor*; *On Summer Seas*; and *Foreign Education for American Girls*, which was one of her last articles.

DAY, WILLIAM R., an Ohio lawyer but little known to the general public when he came to Washington in April 1897, to become Assistant Secretary of State, achieved a marked success in his diplomatic relations during the first eight months of 1898. Mr. Day was born at Ravenna, Ohio, April 17, 1849. He comes from a family of lawyers, both his grandfathers having been Supreme Court judges in Ohio and his father having been Chief Justice of Ohio for many years. He prepared for college in his native town, was graduated from the School of Arts, University of Michigan, in the class of '70, and having been admitted to the Ohio bar, practised law at Canton. In 1886 Mr. Day was elected Judge of the Common Pleas Court of the Ninth Judicial District of Ohio, but in the following year he resigned. President Harrison in 1889 appointed him United States District Judge for the Northern District of Ohio, but he was obliged to decline this honor on account of poor health. Mr. Day was chosen by President McKinley to institute a personal investigation of affairs in Cuba, but, before he could leave, the President called him to the office of Assistant Secretary of State. It was known in Washington at this time, April 1897, that Secretary of State Sherman, by reason of age and weakness could perform little more than the nominal and formal functions of his office. And yet the venerable statesman could hardly be expected to resign as he had left his seat in the United States Senate to become the head of the State Department. The actual labor and responsibility of the Department devolved upon the Assistant Secretary. When Mr. McKenna was appointed to the Supreme Court, the President offered Mr. Day the Attorney-Generalship but he declined. Mr. Day had shown such marked ability in diplomatic affairs that, when Mr. Sherman was obliged to resign by reason of the enormously increased work of the Department occasioned by the troubles with Spain, President McKinley made the former Secretary of State, April 1898. At the same time, at Mr. Day's request, Professor John Bassett Moore, of Columbia University, was made Assistant Secretary. Upon the signing of the protocol between the United States and Spain in August, Mr. Day was placed by the President at the head of the Peace Commission which met with the representatives of Spain at Paris in October. This necessitated his resignation from the State Department (September 16).

DEATH RATE. See PUBLIC HEALTH.

DELAGOA BAY is a large bay on the southeast coast of Africa which forms the southern end of the Portuguese province of Lourenço Marques in Portuguese East Africa. As one of the most important harbors on the entire eastern coast and as the natural outlet for the trade of the interior, its possession has been greatly desired by Great Britain. For a long time Great Britain disputed the Portuguese title but the question was decided in favor of Portugal in 1875. During recent years there have been various reports in regard to the designs of Germany respecting Delagoa Bay and the attempts of Great Britain to purchase it from Portugal. It is the objective point for trade from the Transvaal, but the border of the Transvaal lies 52 miles inland. The Delagoa Bay Railway extends from the coast to the Transvaal frontier at Komati, whence it has been extended to Pretoria, the capital of the Transvaal. This makes Pretoria 350 miles by rail from the sea and Johannesburg 400 miles. The extension of the road in the territory of the Transvaal is the property of the Netherlands South Africa Company. The total length of the road in 1896 was 382 miles. In 1889 the line was seized by Portugal and the claims for compensation led to long negotiations. A tribunal of arbitration was assembled at Berne in Switzerland, but its proceedings dragged on and it had rendered no award at the close of 1898. In the spring of that year, however, the British Under Secretary for Foreign Affairs, Mr. Curzon, announced that experts who had been employed to investigate the case had presented their report. It was then supposed that the decision would soon be rendered, but this was not the case. In August 1898, an agreement was made between Great Britain and Germany in regard to their respective possessions in Africa (see TOGOLAND), and it was rumored that Germany had consented to any arrangement that Great Britain might choose to make respecting Delagoa Bay or other possessions of Portugal. The details of this agreement were not published in 1898, but the belief was current that the control of Delagoa Bay was about to pass to England and the British papers referred in a triumphant tone to the exclusion of the Transvaal from access to the sea.

DELAWARE, a State of the United States, area 2,050 sq. m. Capital, Dover.

Agriculture.—Chief crops with their value in 1898 were: corn, 5,219,600 bu., \$1,118,076; wheat, 988,762, \$682,246; oats, 386,914, \$116,074; buckwheat, 5,296, \$2,118;

potatoes, 251,664, \$173,648; and hay, 71,684 tons, \$605,730—total value, \$2,697,892. Live-stock comprised, horses, 30,883; mules, 4,928; milch cows, 35,376; other cattle, 22,995; sheep, 12,981; and swine, 50,556—total head, 157,719.

Transportation.—In 1897 the railroads under State charter had a total length of 317.77 miles. A new one was opened from Greenwood to Queenstown, Md., and one was projected to connect Lewes and Seaford. The Delaware Railroad was again leased to the Pennsylvania company for a term of thirty years.

Banks.—On October 31, 1898, there were 19 national banks in operation and none in liquidation. Delaware was the only State that reported all her national banks in operation. The aggregate capital was \$2,133,985; deposits, \$5,514,349; circulation, \$1,568,213; and resources, \$9,888,089. There were 4 State banks, with capital, \$680,000, deposits, \$1,136,059, and resources, 2,579,182; two loan and trust companies, with capital, \$1,000,000, deposits, \$2,644,796, and resources, \$4,108,518; and a mutual savings bank, with deposits, \$848,126, and resources, \$981,480.

Government.—The new constitution, which went into operation in 1897, made many radical changes in the fundamental law of the State. The number of State Senators was changed from 9 to 17 and of Representatives from 21 to 35. Presiding officers have a per diem allowance of \$6; all other members \$5. Sessions of the legislature are unlimited, but members will be paid for a service of 60 days only. The Governor is made ineligible for a third term instead of a second as formerly, and is given the veto power, subject to the passage of an act over his veto by a three-fifths vote of each house. The office of Lieutenant-Governor is created, and provision is made for the succession of officers, in case of death, disability, or removal of the Governor, in the manner usual in other States. The Court of Errors and Officials is abolished and a Supreme Court created in its place, consisting of a chancellor, chief justice, and four associate justices, all appointed by the Governor with the consent of the Senate, for terms of 12 years, and with salaries of "not less than \$3,000" per annum. Hereafter clergymen may hold civil offices while regularly engaged in ministerial work. The Attorney-General, Insurance Commissioner, Treasurer, and Auditor are now chosen by popular vote at the general elections. The State is divided into four districts for the purpose of providing for local option; a State board of agriculture is created; and the board of pardons consists of the Lieutenant-Governor, Chancellor, Secretary, Auditor and Treasurer. A new qualification for a voter is the ability to read the State constitution and to write his name. Any person who shall attempt to bribe a voter or interfere with the lawful expression of the people's will at the ballot box will be subject to a fine of from \$100 to \$5,000 or imprisonment for from one month to three years, or both. Under specified circumstances such offender will be disfranchised for ten years. The former poll-tax is changed to a registry fee of \$1, and there will be a uniform biennial registration. In the apportionment of school money no distinction is allowed on account of race or color, and no part of such money may be used for any sectarian church or denominational school. The trial of election cases by a jury is abolished, and a bench of judges, appointed by the Governor, is to have sole jurisdiction, without the intervention of either grand or petit jury. The old boards of canvass are superseded by the courts. Divorces can be granted only by the judgment of the court, instead of by the legislature as formerly. Education is now compulsory.

Education.—At the close of the school year 1896-7, there were 14 public high schools; 3 private secondary schools; a public and a private normal school; a State college; and an agricultural and mechanical school connected with the college. Delaware College has now seven courses, the last addition being one in general science. Tuition is now free to all students belonging in the State. The agricultural and mechanical department, endowed by Congress, received from the Federal government \$22,000 in 1897 and \$23,000 in 1898. In the last year there were 42 periodicals, of which 6 were dailies, 30 weeklies, and 5 monthlies.

Finances.—On December 31, 1897, the liabilities of the State aggregated \$844,750, and the treasury held assets amounting to \$1,120,816, or \$276,066 in excess of the liabilities. The total assessed valuation was \$77,632,079, a gain of \$3,497,678 in seven years. In January 1898, the total debt was \$769,750, a decrease of \$312,690 since 1890. The new constitution prohibits the State from borrowing money or creating a debt, excepting "to supply casual deficiencies, repel invasion, suppress insurrections, defend the state in war, or pay existing debts." Countries, cities, towns, or other municipalities are prohibited from lending their credit, appropriating money, or aiding in any manner any private person or corporation.

Population.—As estimated by Federal officials, the population on June 30, 1898, was about 187,000.

Events of 1898.—Shortly before its adjournment the legislature passed a law nullifying civil service law by practically destroying the Australian ballot system. This the Governor afterwards restored. One of the most sensational incidents in the State was the trial of Senator Kenney for defrauding a bank; the jury disagreed.

Officers.—The Representative to the House is John H. Hoffecker (Rep.), from Smyrna, whose plurality was 2,510; the Senators are Richard R. Kenney (Dem.), from Dover; and a Republican.

The officials at the beginning of 1899 were: E. W. Tunnell (Dem.), Governor; J. H. Hughes (Dem.), Secretary; L. H. Ball (Rep.), Treasurer; Edward Fowler (Dem.), Commissioner of Insurance; Robert P. White (Dem.), Attorney-General; J. A. Lingo (Rep.), Auditor; and Garrett T. Hart (Dem.), Adjutant-General. Chief Justice, Charles Lore (Dem.); Associates, Ignatius C. Grubb (Dem.), W. C. Spruance (Rep.), James Penniweil (Rep.), William H. Boyce (Dem.), and Clerk, W. S. Hutson (Dem.). There are 21 Democrats and 31 Republicans in the State legislature.

DELUGE, BABYLONIAN ACCOUNT OF. See ARCHÆOLOGY (paragraph Babylonia).

DEMANGE, EDGAR, the counsel for Dreyfus (see FRANCE) in his trial before the secret court martial. He undertook the case only after convincing himself that his client was innocent, and he is said to have remarked that he was perfectly sure that had the trial been public, Dreyfus would not have been condemned. His services were heartily appreciated by the accused, who wrote to him that he felt sure that an innocent man could not be forever condemned. Demange criticized severely the action of the court in proceeding with the Esterhazy trial with closed doors, attributing to it the prolongation of the popular excitement. He caused a great sensation by stating publicly in court that the decision of the court martial was illegal, since the judges had evidence which was not communicated to the accused, and again on July 9, 1898—two days after M. Cavaignac's speech in the Chamber—M. Demange wrote that the documents cited by the Minister of War and used against Dreyfus in his trial, had never been shown to the prisoner or to his counsel.

DENDERAH, EGYPT. See ARCHÆOLOGY.

DENMARK is the smallest of the three Scandinavian states, having an area, including the Farøe Islands, and the islands of the Baltic sea, of 52,289 sq. m. and a population exclusive of the colonies, estimated in 1897 at 2,256,000. The area of the crown dependency of Iceland, and the colonies of Greenland and the West Indies is 86,614 square miles, with a population in 1890 of 114,229. About 80 per cent. of the soil of Denmark is productive. The land is divided into small holdings, and the system of tenure is largely peasant proprietorship. The importance of agriculture is increasing and recent statistics show a more extensive foreign demand for native agricultural products. Nevertheless, Denmark does not raise sufficient cereals for home consumption and imports a much larger quantity than she exports. The principal crops raised are oats, barley, rye, wheat, potatoes and other vegetables. Dairy-farming is one of the chief occupations, the export of dairy products being an important source of wealth. Mineral resources are not extensive, but coal, gypsum and salt are found. The lack of a sufficient supply of coal has retarded the development of manufactures.

Exports and Imports.—The chief exports are pork, butter, eggs, lard, and colonial goods. The exportation of dairy products has recently increased to an enormous extent. As to the distribution of the export trade, the leading nations to which Danish exports were sent in 1896 were, in the order of their importance, Great Britain, Germany, Sweden and Norway, Russia, the Danish Colonies, France, and the United States, and of these Great Britain's share was by far the largest. In that year the leading nations in respect to imports into Denmark were in the order of their importance, Germany, Great Britain, Sweden and Norway, Russia, United States, Holland, France and Belgium. In 1896 Denmark exported to Great Britain goods to the value of 169,684,000 kroner, and imported from Great Britain goods to the value of 78,264,000 kroner, both showing an increase over the previous year. In the same year the value of the exports to Germany was 57,842,000 kroner, and of the imports 126,077,000 kroner. During the year ending June 30, 1898, Denmark exported to the United States goods to the value of \$211,837 and imported from the United States goods to the value of \$12,697,421. As an illustration of the vast increase in the exportation of butter, it may be stated that Denmark's exports of butter to Great Britain rose from £767,190 in 1870, to £6,288,413 in 1896. There is regular steamship service to the United States, steamers running from Copenhagen to New Orleans and, since December, 1897, from Copenhagen to Newport News and Norfolk. It was announced in March, 1898, that more complete communications would be afforded by different vessels and that efforts would be made to promote the interchange of articles of commerce.

Revenues and Expenditures.—The revenue for 1897 was 65,235,336 kroner, and the expenditures 65,235,594 kroner, the value of the krone, or crown, being in United

States currency 26.8 cents. The estimated revenue and expenditures for 1897-98 were 66,847,101 and 64,734,189 kroner respectively; for 1898-99, 68,568,724, and 68,430,032 kroner respectively; and for 1899-1900, 68,200,000 and 68,000,000 kroner respectively. The estimate of the budget for 1898-9 showed the chief sources of revenue to be, indirect taxes, direct taxes, and the interest on the state assets. A considerable income each year is derived from the State Lottery. In the same estimate the largest item of expenditure was for the improvement of state property and reduction of the debt, and the next item of importance was the Ministry of War. Between 1880 and 1895 the debt increased, but since that it has been reduced, being in 1898, £11,579,335.

Army and Navy.—All able-bodied men who have reached the age of twenty-two are liable to military service for eight years in the regular army and its reserve, and for eight years in the extra reserve. Important changes have been undertaken since 1894, and it has been estimated that by the year 1910 Denmark will have an effective force of 83,000 men, but according to the figures for 1897 the strength of the army on a peace footing was 751 officers and 10,000 men, and on a war footing, 1,352 officers, and 45,910 men, and, including the Citizens' Corps of Copenhagen and Bornholm Island, the total war strength amounted to about 60,000 men. The Danish fleet is kept up for purposes of coast defence and was represented in 1897 by 3 coast defence armor clads; 11 cruisers of the third class and gun vessels; 5 gun boats, and a flotilla of 24 torpedo boats.

Labor Interests.—A law providing compensation for workingmen in case of accident was passed in 1898 but was not to go into operation until January 1, 1899. The injured workingman is to receive three-fifths of his daily earnings beginning at the close of the thirteenth week from the time of the accident and lasting so long as the disablement is complete. If the disablement be permanent a sum equal to six times his yearly wages is granted to him and in case of death the burial expenses are paid and the family receives four times the yearly wages of the deceased.

Political Parties and History.—Danish political parties are divided on the question of the supremacy of the Lower House of Parliament. The Conservative party, or Right, hold that the constitution does not give to the Lower House, or Folkething, the control in matters of finance and taxation or the right to decide who shall be the ministers. These powers and rights are claimed for the Folkething, by the other party known as the Left, which, however, is divided into two groups, the Radicals and the Moderates. The Left favors the English parliamentary system and maintains that the Folkething may not be overruled by the Landsting, or Upper House, and the King. For years the majority in the Folkething has been fighting the Upper House on this issue. After the election of 1892 the Moderate Left held 43 seats, the Radical Left 28, and the Right 30 seats in the Folkething. This was a falling off for the Radical Left, which in the previous election had secured 39 seats. It was now agreed that a compromise should be established, the majority promising to confirm the provisional laws which had been enacted by the ministry and the ministry promising to resign. This agreement was carried out and the Estrup ministry retired after holding office for nineteen years (August 7, 1894). The new Premier, Baron de Reedtz-Thott, made overtures to the Radical party. A series of somewhat democratic measures were introduced and there was a gradual leaning toward the Agrarian element in the Folkething. The result of this was to offend the Conservatives and at the same time it did not insure Radical and Socialistic support because the measures of the government did not go far enough in the desired direction. In the meanwhile in 1895 the Radicals had gained a large number of seats and the Conservative minority was further reduced. In 1897 a conflict arose with the ministry over an item of the budget which was objectionable to some of the Radicals and Socialists. The Conservatives remained inactive hoping that the Radicals would overthrow the ministry, but a compromise was reached in regard to the budget and the Radicals continued to support the Premier. The Conservatives now steadily opposed the government and in the spring of 1897 the Premier retired. The new minister was M. Hoerring whose affiliations with the Agrarian element were not so marked as those of the previous Premier. The elections of April, 1898, showed further gains for the Radicals and losses for the Conservatives. The returns gave 63 Radicals, 23 Moderates, 12 Socialists, and 15 Conservatives. Thus the Radicals had an absolute majority over all others in the Folkething. But the Hoerring ministry did not resign, continuing to rely for its support on the Landsting. To that body the elections of September, 1898, returned 43 Conservatives and 23 members of the opposition.

Among the other important events of the year 1898, were the festivities in commemoration of the events of 1848; the meeting of the Socialists' congress at Odensee on August 4; and the death of Queen Louise of Denmark on September 29, followed by her interment in the Roskilde Cathedral on October 15, the funeral being attended by a number of royal personages including the Czar of Russia, the King of Sweden, and the King of Greece.

DENSITY OF EARTH. See PHYSICS (paragraph Gravitation Constant, etc.).

DERMATOLOGICAL ASSOCIATION, AMERICAN, organized in 1876, to promote the study of dermatology. Membership restricted to regular graduates in medicine who have practiced 5 years in the specialty in the United States or in Canada. Next annual meeting in Philadelphia, Pa., in June, 1899. President, J. K. Fordyce, M. D.; Secretary, Geo. T. Jackson, M. D., 14 E. 31st st., New York City.

DEROULEDE, PAUL, a French poet and politician, born September 2, 1848, was prominent in the year 1898 for his violence as a member of the Anti-Dreyfusards. He was the organizer and chief of the "League of Patriots," being for the second time elected president of that body in 1895. He attacked in a furious speech the prime minister Brisson for his favorable attitude toward the revision and he was foremost in the hue and cry raised against the Jews and against Zola. See FRANCE (paragraphs on History). Among his recent writings may be mentioned: *Chants du paysan* (1894); *Messire du Guesclin* (1895); *Poésies Militaires* (1896); and *La mort de Hoche* (1897).

DESART, WILLIAM ULICK O'CONNOR CUFFE, Fourth Earl of, died September 15, 1898. He was born in London July 10, 1845; was educated at Eton and Bonn; became page of honour to the Queen, and in 1862 lieutenant in the Grenadier Guards and in 1865 captain. He was the author of many novels, among which are: *Kelverdale*; *Lord and Lady Picadilly*; *Children of Nature*; *Love and Pride on an Iceberg*; *Helen's Vow*; *The Raid of the "Detrimental"* (1897).

DESCHANEL, PAUL, was reelected permanent president of the French Chamber of Deputies in June, 1898. He was born in Brussels in 1857, his father being an exile from France at that time. He was educated at Sainte Barbe and afterwards at the Lycée Condorcet and in 1876 became secretary to the Minister of the Interior. After holding several minor offices he stood for a seat in the Chamber of Deputies but was defeated (1881). Four years later he was elected as a Moderate Republican. At the close of 1891 he visited the United States as a commissioner of France to study the labor problem in this country, and with this object in view conferred with the prominent representatives of labor and investigated the different systems of trades unions. After about two months spent in traveling throughout the country he returned to France, having stated as his general impression that the American laboring classes were better paid, better fed and as a rule more contented with their lot than those in France. In the Chamber of Deputies his career has been marked by conservatism. His oratory is said to be of a high order and his speeches on financial questions especially effective.

DEVELOPMENT OF THE EMBRYO. Of all the advances made during 1898 in our knowledge of embryonic development, that made in Reptilian embryology through the investigations of Professor Dendy on the New Zealand Tuatua Lizard (*Sphenodon*) is undoubtedly the most important. This interesting animal, the only living representative of its order and regarded as the oldest existing type of reptile, is now found only on Stephen's Island off the coast of New Zealand, where it is at present protected by the government. By special permission, Professor Dendy secured the eggs, the collecting of which is forbidden by law. They are laid in November, but do not hatch for 13 months, the embryos passing the winter in a state of hibernation. In this respect they resemble the embryos of some turtles, which have heretofore been considered the only vertebrate embryos having this peculiarity. Before hibernation the nostrils of the embryo become plugged up with a growth of cellular tissue. The early stages of development are strikingly like the corresponding stages in the turtle, and this is especially true of the membranes that surround the young animal. The posterior amniotic canal, leading to the exterior behind the embryo and previously known only in turtles, is present. These facts seem to confirm, at least in part, the views of certain zoölogists that this curious reptile is as nearly related to the turtles as it is to the lizards. In the later stages of development, the young animal has a strongly developed pattern of longitudinal and transverse stripes, which disappears before hatching, the adult being usually spotted. This is an interesting confirmation of the law of coloration which has been observed to prevail among many mammals and birds, that a striped condition usually precedes a spotted or plain coloration.

It is interesting to consider that as in 1898 the most important advance in our knowledge of development comes from the antipodes, so in the preceding year the most important contribution to embryology was by Professor Hill of Australia, showing the presence of a placenta in the Marsupial, *Perameles*. That these most important discoveries and additions to our knowledge should come from workers geographically so far away is an interesting commentary on the advances made in our knowledge of the development of animals since Professor Agassiz gave his famous lectures on *Comparative Embryology*.

The development of representatives of all the important groups of animals has now been worked out so thoroughly that the relationship of the parts to each other and

the likenesses between the embryos of different animals are much more clearly understood than ever before. During the past five or six years the science of "Developmental Mechanics" has been recognized and many investigators are engaged with its problems. It is now well known that the form which the earliest stages of development take depends largely on the amount of yolk in the egg; those in which the amount of yolk is comparatively small dividing completely in the first stages, while those with a great deal of yolk divide only superficially. The three layers of the embryo, now known as *ectoderm*, *mesoderm* and *endoderm*, arise differently in different groups of animals and their origin and ultimate fate forms one of the fascinating problems of embryology. As a rule we can say the ectoderm gives rise to the body-covering and nervous system, and the mesoderm to muscles, and the circulatory system and internal skeleton when these are present. The endoderm, from which the greater part of the alimentary canal is formed, usually arises as an invagination of certain larger cells at one pole of the dividing egg, and as these cells become completely covered by the more numerous small cells of the other pole, which form the ectoderm, there is a small opening or pore left at one end of the embryo, known as the *blastopore*. In eggs of fishes, reptiles, birds, etc., the large amount of yolk prevents the enclosing of the endoderm cells by the ectoderm and accordingly no true blastopore is formed. But it is not unlikely that the *primitive streak* (Agassiz's "primitive stripe") or at least one end of it, represents all that remains of the original blastopore. At any rate it subsequently disappears and does not give rise, as was once supposed, to the *chorda dorsalis* (notochord) nor do its edges unite to form "a closed canal which is soon filled with a fluid from which the brain and spinal cord are subsequently developed." The notochord arises some time after the primitive streak has disappeared, as a thickening on the dorsal side of the primitive gut and is therefore derived from the endoderm. The brain and spinal cord are formed from a furrow in the ectoderm, in front of the primitive streak, which gradually sinks into the mesoderm and becomes a hollow tube of ectoderm entirely cut off from the exterior. Its anterior end subsequently enlarges and gives rise to the brain, the first appearance of which is in the divisions of swellings, but these do *not* "correspond to the organs of sight, hearing and smell." The most anterior of them subsequently gives rise to the cerebrum and the optic thalami, the middle one gives rise to the optic lobes, and from the posterior arise the cerebellum and medulla oblongata. During their early stages the embryos of vertebrates resemble each other closely but the differences between them are yet so well marked that the class or even the order to which they belong can be determined very early in life. Unfortunately space does not permit us to go further into the problems of development or to discuss any more of the advances made in our knowledge during the past year.

DEWEY, GEORGE, Rear-Admiral, U. S. N., who was brought into especial prominence by his brilliant victory in Manila bay on May 1, 1898, and who was popularly held as the first hero of the Spanish-American War, was by no means unknown before the battle of Manila, for he had a most honorable record, having fought with great bravery under Admiral Farragut in the Civil War, and having occupied various positions of rank and responsibility since that time. Admiral Dewey is of old English stock and was born in Montpelier, Vermont, December 26, 1837. His father Doctor Julius Dewey was a man of great strength of character, kindly and religious. The admiral seems to have inherited many of his strong points from this man of whom he has said, "Of all the public men I have met in my experiences in the world, my father stands first in character."

In 1825 Julius Dewey married Miss Mary Perrin. Four children were born, Charles, Edward, George, and Mary. As a boy George showed a great love for outdoor sports and activity of every kind. At fifteen he entered the Norwich Military Academy, at Norwich, Vermont, and two years later the Naval Academy at Annapolis as a member of the class of '58. The class entered with sixty-five, fourteen of whom received diplomas, Dewey ranking fifth. Two years later he returned to be examined for a commission; his standing gained at this time, together with his mark at graduation, gave him three as a final class rating. When Fort Sumter was fired on, Dewey was ordered to serve as first lieutenant on the *Mississippi* of the West Gulf squadron, which fleet in February 1862, came under the command of Admiral Farragut. In April the larger vessels, among them the *Mississippi*, passed up the river with the purpose of running the batteries of St. Philip and Jackson and engaging the Confederate fleet which lay below New Orleans. The undertaking was hazardous, but in the terrific cannonading that ensued young Dewey bore himself with the utmost calmness and bravery. The next year when the *Mississippi* was stranded and lost on the Port Hudson shoals, though the shots were flying so thick that the boat was struck two hundred and fifty times in half an hour, Lieutenant Dewey, on whom devolved the task of getting the men off in safety, again conducted himself with that firmness and ability which has always been characteristic of the man. Years afterward Admiral Farragut said to the old Doctor, the lieutenant's

ADMIRAL GEORGE DEWEY.

father, "Sir, your son George is a worthy and brave officer. He has an honorable record and some day will make his own mark." In December, 1864, and January, 1865, Lieutenant Dewey served with distinction at Fort Fisher on the *Colorado*, under Commodore Thatcher and Admiral Porter. Two months later he was made a lieutenant-commander. During the first two years after the war he served with the European squadron; in 1868 he was attached to the Naval Academy, and two years later received his first command. In 1875 he was made commander. After serving on the Light-house Board and as commander of the *Juniata* in the Asiatic squadron, he was advanced in 1884 to the rank of captain, having in command the *Dolphin*, of the "White Squadron," and the next year he was transferred to the *Pensacola*, the flagship of the European squadron. After 1888 he served in several responsible positions on shore, and when he was made commodore became the chief of the Board of Inspection and Survey. At the beginning of 1898 he was ordered to sea again, taking in command the Asiatic squadron, which was destined to have such an important part in the Spanish-American War. Upon receiving the report of the battle of Manila, President McKinley immediately made Commodore Dewey an acting rear-admiral, and Congress unanimously passed a joint resolution of thanks, and a bill increasing by one the number of rear-admirals, so that Commodore Dewey might receive immediate promotion.

The admiral was married about 1867 to Miss Susy Goodwin, daughter of the well known "fighting governor" of New Hampshire. His wife died in 1872. He has one son, George Goodwin, born in 1872. See SPANISH-AMERICAN WAR (paragraph Battle of Manila).

DHOUKHOBORTSI, a Russian sect termed by their Orthodox fellow-countrymen, "spirit wrestlers," but claiming for themselves the name of "Universal Brotherhood Christians." Their origin, which dates from the eighteenth century, is obscure, but is attributed by some to Quaker influence. They do not believe in a personal God and in their doctrine of the Trinity they identify the memory, the reason and the will with God the Father, God the Son, and God the Holy Ghost, respectively. They are communists, but, although they do not recognize human authority as binding, they have not shown themselves revolutionary in practice, for generally they have offered no resistance to governmental decrees beyond a persistent refusal to take up arms. With them the family tie is not regarded as binding except in so far as it rests upon mutual affection. The sect has been subjected to persecution for several centuries. In 1799 the Czar issued a decree directing their banishment to Siberia for life and 15,000 of them are said to have been transported in consequence. In 1860 nearly an equal number of these exiles returned to Russia. At last they sought permission to emigrate and obtained it on condition that they should do so within two years and at their own expense. The interest of philanthropic persons in other countries was enlisted by Count Tolstoi, and in England some practical efforts were made on their behalf, resulting in the transplanting of about 1,100 of them as a colony in Cyprus. Recently people in Canada and in the United States have shown an interest in their cause. The Canadian government has consented to the settlement of numbers of them in western Canada. In the United States a committee was formed in 1898 to aid them in emigrating.

DIAMONDS. For the year ending June 30, 1897, 2,769,423 carats, or 1254.3 lbs. avoirdupois, or about $\frac{5}{8}$ of a ton of diamonds were produced by the De Beers Consolidated Mines, Ltd., of South Africa. This required washing of 2,409,030 tons of diamond bearing rock. The following figures apply to the same company and extend to June 30, 1897:

Number of loads (16 cwt.) of blue ground hoisted.....	2,515,889
Number of loads (16 cwt.) of blue ground washed.....	3,011,288
Number of carats of diamonds recovered.....	2,769,423
Amount realized by sale of diamonds.....	£3,722,099 \$18,610,495
Number of carats per load of blue ground.....	0.92
Amount realized per carat sold.....	\$6.45
Amount realized per load....	\$5.93
Cost of production per load	\$1.77
Profit per load	\$4.16

Up to the end of 1897 the total weight of diamonds exported from South Africa exceeded 63,000,000 carats ($12\frac{3}{4}$ tons), valued at about £87,000,000, or \$435,000,000.

A new district has been discovered in the Transvaal, thirty kilometres east of Pretoria, and 480 kilometres from the Kimberley Mines.

Recent experiments tend to show that diamonds may be produced by bringing a fused silicate mineral in contact with carbon, and as the African diamonds are found in igneous rocks, which cut carbonaceous shale, they may have been formed in this way.

DIARRHŒA. See PUBLIC HEALTH.

DIET AND FOOD. Haig, of London, has published a small brochure during the year, in which he treats of the physiology of albumen and urea, in the line of his first work on uric acid in the causation of disease. He considers the ignorance of people in regard to the relative value and importance of foods as accountable for much disease. He alludes to the error of carrying the diet of youth into middle life, or the diet for an active, out-door life into a life of sedentary office work. The first essential of nutrition is the supply to the blood of albumen, sufficient in quantity to replace that transformed into urea in the production of force. Exercise increases the production of urea. With the fall in the quantity of urea there is a corresponding diminution of strength and power of endurance, that is, of force production. The excretion of urea is the measure of the force available; its falls and rises accurately register the conditions of the nutrition, strength and endurance of the body. Haig has tested on himself and others the urea-producing power of milk, cheese and sugar, finding that the earliest results came from milk, the slowest from sugar, and that the rise in urea from sugar was due to the rise of acidity preceding it. Sugar owes its bad reputation as a producer of gout, Haig says, to its effects on acidity and the solubility of uric acid. If uric acid supplies are kept low, and the supply of fresh vegetables and fruits is good, sugar can do no harm. The trouble with it has arisen from associating it with animal flesh. Ingestion of dilute acetic acid caused a rise in acidity and in urea, because it clears the blood of uric acid which probably in colloidal form is obstructing the peripheral capillary circulation and preventing both the ready access of the blood albumens to the tissues and the removal of waste products from these. Fatigue Haig considers due to a general dearth of albumens in the blood and a condition in the blood which leads to its defective circulation through the tissues, so that though the blood contains albumens the tissues cannot readily extract them, and also the tissues become laden with waste products. Meat-eaters, who also use tea, coffee, tobacco and stimulants suffer early from fatigue; while those who get their albumens from milk, cheese and vegetables, and use lemons, show great endurance. The latter class suffer, also, less shock after injury, with less liability to fatal results. The available foods, free from uric acid, are the following: (1) Milk and milk products, as cheese. (2) The pulses, as peas, beans, lentils and dhol. (3) Bread stuffs, cereal foods and glutens. (4) Nuts and nut foods. (5) Garden vegetables, as potatoes. (6) Garden fruits, as apples. (7) Dried and foreign fruits. For a man weighing 140 lbs. Haig proposes a daily allowance as follows:

10 oz. of bread, 8 per cent. of albumens.....	340 grains
2 oz of oatmeal, 12 per cent. of albumens.....	104 grains
2 pints of milk, 3 per cent. of albumens.....	525 grains
2 oz. of cheese, 33 per cent. of albumens.....	281 grains
1 oz. of pulses, 22 per cent. of albumens.....	94 grains
Fruits, nuts and vegetables, about ½ to 2 per cent. albumens.....	126 grains

Total, 1,470 grs. of albumens daily, which will produce 490 grs. of urea per day when completely digested and metabolized. See SUGAR AS A FOOD.

DINGLEY, NELSON, Jr., member of the national House of Representatives from the second district of Maine, leader of the Republicans, and chairman of the ways and means committee, was appointed a member of the Anglo-American Joint High Commission, which was created in May, 1898. He was born at Durham, Androscoggin county, Maine, February 15, 1832; entered Waterville College (now Colby University) in 1851, but was graduated from Dartmouth in 1855. Though admitted to the bar he did not practice law, but in 1856 became editor and proprietor of the *Lewiston Journal*, a weekly, which in 1861 became a daily. This paper, with which he always maintained some connection, has been constant in its support of Republican principles. Mr. Dingley was a member of the State House of Representatives in 1862-65, 1868, and 1873, being speaker 1863-64; he was Governor of Maine for the two terms 1874 and 1875 and declined renomination; and in 1876 was a delegate to the national Republican convention. On September 12, 1881, he was chosen at a special election to fill the vacancy in the Forty-Seventh Congress made by the election of William P. Frye to the United States Senate; he was reelected as representative at large to the next Congress, and was returned successively to the Forty-Ninth—Fifty-Fifth Congresses. Since his first speech in Congress, which was on the subject of protection to American shipping, he has favored legislation for the development of American shipping and fisheries. He aided in the preparation of the McKinley tariff law of 1890, opposed the Wilson law of 1894, and framed the present tariff schedule which became a law in 1897. It was upon his initiative that the Bureau of Navigation in the Treasury Department was organized. In 1874 he received the degree of LL. D. from Bates College, and in 1894 from Dartmouth. Mr. Dingley was always popular with his constituents and his party

and was recognized by all as an able and conscientious member of Congress. On June 11, 1857, he was married to Miss Salome McKenny. They had six children, of whom five are living.

DIPHTHERIA. The control of diphtheria, which has been epidemic in this country since 1857, is largely due to the early treatment of the disease with antitoxin, together with systematic isolation of cases. While occasional clinicians of experience and ability are found who actively antagonize the theory of and deny the good results claimed for the use of antitoxin, the great and overwhelming mass of evidence in its favor continues to increase year by year. The diphtheria committee of the Clinical Society of London in its report for 1898 publishes the following results of inquiry into 633 genuine cases of diphtheria: The total mortality in these cases was 19.5 per cent., as opposed to 29.6 per cent. in the non-antitoxin control series, compiled before the introduction of antitoxin. In the tracheotomy cases the mortality amounted to 36 per cent., as opposed to 71.6 per cent. in the non-antitoxin series. Buchwald, of Munich, reports 57.72 per cent. of deaths in cases treated without antitoxin, 28.93 per cent. of those treated with antitoxin. Krönlein, of Zürich, reported to the Congress of German Surgeons in April, 1898, upon 1,773 cases of diphtheria observed in the clinical hospitals of the University from 1881 to 1897. The mortality in the pre-antitoxin period was 39.9 per cent. as against 12.5 per cent. in the antitoxin period. In the operation cases (including both tracheotomy and intubation cases), the mortality was 66.1 per cent. under the old régime, and 35.6 per cent. with antitoxin. In the cases not operated upon the mortality in the pre-antitoxin period was 14.2 per cent. against 5.6 per cent. under antitoxin. In all the 437 cases occurring in the antitoxin period the Klebs-Löffler bacillus was demonstrated. A. Jacobi, of New York, (*Twentieth Century Practice*), sums up the facts proved by Krönlein's statistics as follows: While the morbidity of the whole district (city and country) remained unaltered in the antitoxin period, the mortality decreased considerably, and principally in the first years of life. While previously to the institution of the antitoxin treatment one-half of all the cases demanded operation, this percentage had fallen to 23.1 per cent. since that time. H. M. Biggs, of New York, concludes from extensive experience and many researches made as pathologist for the Health Department, that since the introduction of antitoxin treatment the mortality of diphtheria is reduced to one-half, its course is shorter and milder; an injection made within the first two days reduces the mortality to 5 per cent.; the earlier it is made the better the result. Small quantities of concentrated serum are tolerated by the very youngest babies. If antitoxin is not a specific it is certainly the best remedy in our possession against diphtheria. The genuine (that is, uncomplicated bacillary) cases are more amenable to its favorable influence than mixed infections. It has no secondary effects on heart, kidneys or nerves. Heart failure and paralysis whenever observed are caused by diphtheria not by antitoxin.

Klebs reported in 1883 his discovery of the bacillus which causes diphtheria, and in the succeeding year Löffler published the results of extensive investigations of the subject. Roux and Yersin added proof to the dependence of diphtheria on this bacillus, and the names of the first discoveries have been given to the causative micro-organism. The Klebs-Löffler bacillus is an aërobe, non-motile and non-liquefying, and does not form spores. It occurs in the form of rods, straight or slightly curved, generally swollen at the ends, or swollen in the middle portion and pointed at the ends, found singly or in pairs, and very infrequently in chains of three or four. The diphtheria toxin has been isolated by Roux, Yersin, Brieger, Fraenkel and others, by filtration through porous porcelain from cultures of the living bacilli. While it has not yet been successfully analyzed, it appears to be analogous to the poisons of certain venomous serpents. Fraenkel, Behring, Wernicke, Aronson, Roux and others have succeeded in rendering animals immune to diphtheria by the use of inoculations of virulent or somewhat attenuated cultures or of diphtheria toxin. W. H. Park, of New York, says: "The most important and valuable results are those which have been obtained by Behring, in conjunction with others, who showed that the blood of immune animals contains a substance which neutralizes the diphtheria toxin. The blood-serum of persons who have recovered from diphtheria has also been found to possess this protective property, which it acquires about a week after the beginning of the disease, and loses again in a few months." To obtain antitoxin for therapeutic purposes, strong toxin obtained from virulent cultures of the Klebs-Löffler bacillus are injected into young and healthy horses. At the end of two months, during which time increasing doses of the toxin have been given, blood is drawn from the horses and tested for antitoxin. Those having sufficiently strong antitoxin are retained and the process of inoculating and of withdrawing serum is repeated for years, allowing 3 months each year as an interval of freedom from inoculations. The serum obtained is sterilized by the addition of carbolic acid by some who prepare it, but Park considers the addition of any antiseptic as not only unnecessary but probably inadvisable. The antitoxic serum is used hypodermically as

early as a diagnosis of diphtheria has been made, in dosage of from 600 to 2,000 units. A unit is equivalent to 1 c. c. of "normal serum." Normal serum is the blood serum of an immunized animal which was made so efficacious that 0. 1 c. c. antagonizes ten times the minimum of diphtheria poison fatal to a guinea pig, weighing 300 gm., or about 10 ounces (Jacobi). In the preparation of this article free use has been made of the essays in *Twentieth Century Practice*, Wm. Wood & Co. See PUBLIC HEALTH and SERUM THERAPY.

DISCIPLES OF CHRIST, a division of Baptists, also known as the Campbellites, and as the Church of Christ. They are composed principally of rural people, but they are now increasing in the cities. There are (1898), 5,922 ministers, 10,088 churches, and 1,085,615 members. In 1898 they had 42 State and district missionary societies, and they inaugurated a system of city evangelization and collected and expended \$506,454 in missionary work at home and abroad. The three missionary societies of the church, the American Christian Missionary Society, the Christian Woman's Board of Missions, and the Foreign Christian Missionary Society supported mission workers in the West Indies, India, and in Mexico, besides in the United States. This denomination has 646 Christian Endeavor societies.

DISINFECTION. See FORMALDEHYDE.

DISPENSARY ABUSE. The want of unanimity among physicians in limiting the dispensary abuse still exists and the abuse increases. In all the large cities where medical colleges exist the number of well-to-do people who seek free medical aid increases. The blame appears to lie at the doors of the trustees and superintendents of the clinics and of the physicians who practice in the clinics. The college clinic is established for the purpose of securing material with which to illustrate the didactic lectures delivered by the professors, and with which to teach medical students appearances and conditions of disease. To give free medical advice to the poor is generally a secondary consideration. The applicant for free treatment at a college clinic, or at a dispensary where the attending physician is allowed to teach private paying pupils with the illustrative aid of the patients, is quite as often admitted in silence as he is questioned about his ability to pay a fair fee to a physician practising near his home. If the question is asked him, he is not always truthful. It is a matter of common occurrence for patients to wear old clothing and give fictitious names and false addresses, in order to save paying a physician the fees they are abundantly able to afford. Patients will spend in railroad fares from adjacent or even distant towns the money they will not pay to their physicians at home, and then ask free treatment at the hands of one whom they think more famous or more competent. Some patients have been known to drive in cabs to dispensaries and ask gratuitous aid. Others proffer a banknote of considerable size to pay the small fee (generally ten cents) charged for medicines. When the Vanderbilt Clinic of the College of Physicians and Surgeons, medical department of Columbia University, in New York City, was first opened, all cases applying for treatment were investigated by the Charity Organization Society of that city. The Society discovered that about one-third of the cases were undeserving. Carelessness in investigating the status of people applying, a desire to show large numbers at the end of the year, the hope of attracting a disproportionately great number of unusual or rare cases of disease and an attempt to secure a large share of the charitable funds of the community—the share being proportionate to the work done—combine to create, foster and increase the dispensary abuse. The latest available statistics in New York State, in which the dispensary abuse probably flourishes most extensively are those collected by the State Board of Charities, and are limited to the seven largest cities in that State. They are as follows for the year 1897:

	Number of Patients.	Per Cent. of Population.	Number of Prescriptions.
New York.....	1,077,140	71	1,699,468
Brooklyn.....	252,695	31.3	455,940
Buffalo.....	14,886	5.8	32,509
Rochester	2,476	1.8	6,698
Albany.....	20,345	21.4	17,939
Syracuse.....	8,796	9.9	6,116
Troy.....	715	1.2	716

The figures apparently showing the percentage of population are misleading, because many patients come from a distance to be treated at the free dispensaries of all

large cities. Patients have come, for example, to make application at the Vanderbilt Clinic, in New York City, from towns on Long Island, in the Hudson River Valley, in New Jersey, in Connecticut and even in Vermont.

The physicians who serve in the clinics and dispensaries receive no salaries and no fees of any kind. Their return comes, if it comes at all, from the clinical experience afforded and the prestige attached to membership in the medical staff of a perhaps famous institution. Their colleagues, to whose offices the well-to-do patients ought to go, are defrauded out of their natural income, and these patients are demoralized and allowed to take the first step toward pauperization. Of late years some bill calculated to control the dispensary abuse has been introduced annually into the State Legislature as soon as the annual meeting has occurred. Most of the bills die in committee. In March, 1898, the New York State Senate Committee on Public Health reported favorably a dispensary bill for New York City, after a long and stormy argument. Dr. E. Eliot Harris, of New York, thus sums up the salient features of this bill:

"This bill is designed to restore to the poor people an absolute monopoly of what belongs to them alone by virtue of the prime purpose for which all dispensaries are designed, and prevent any further encroachment upon the rights of the poor by those who have no right so to encroach. Every dispensary is supported by private donations and bequests, or by public appropriations, or by both, solely for the benefit of the poor, and the use of those institutions by any but the poor is an abuse of medical charity, and a fraud upon the institution, or else a misapplication by the institution of private funds held in trust by it for a specific purpose, or public funds appropriated for a specific purpose, or both. This bill is designed to relieve the poor of the annoyance and inconvenience constantly complained of, they being compelled to wait in these dispensaries until well-to-do patrons are cared for. If this bill is not passed, you will find that within one decade the charitably disposed, influenced by the present condition of acknowledged misuse of legacies and bequests, will turn their charitable instincts in some other direction. Then what will become of the increased number of poor in the greatly increased population that will then exist? All dispensaries have taxes remitted and participate in the charitable funds of the community in proportion to work done, and their sworn statements to the Board of Charities demonstrate that the charitable work done in the dispensaries of New York City equals 50 per cent. of the population, showing the necessity for State control of the methods of bookkeeping in the matter of the investment of such funds as come into their hands, and the institution of a proper system of registering the cases treated. The bill provides that rules and regulations which will include a system of bookkeeping, and the registering of all cases treated shall be made by the State Board of Charities." The bill did not become a law.

DISPERSION FORMULA. See PHYSICS (paragraph Interpolation Formula for Prismatic Spectrum).

DISTILLING SHIPS to produce fresh water for the boilers of the United States naval vessels engaged in blockading the Cuban ports during the war with Spain, and at Manila, were found to be necessary, and two vessels were purchased by the government and equipped for this work. These were the *Iris* and *Rainbow*. Both were iron vessels about 310 feet long, 38½ feet beam, and 27 feet depth of hold, with speeds of from 10 to 12 knots, and capacity of about 2,500 tons. The *Iris* was equipped with a form of boiler known as an evaporator, the total capacity of the 12 evaporators being 60,000 gallons per day, or two pounds of fresh water per pound of coal burned. In the fore part of the vessel were 17 large storage tanks, capable of holding 83,000 gallons of fresh water, and in the rear were 16 similar tanks with a capacity of 95,000 gallons, or a total of 178,000 gallons. The process is to pump sea water into the evaporators, where it is heated and slowly turned into steam. It then passes to the condenser and is turned into water. From the condensers it flows to the storage tanks. The cost of fresh water obtained in this way averaged about 18 cents per ton, against 70 cents per ton for fresh water conveyed in lighters and tank boats.

DISTRIBUTION OF ANIMALS. Our knowledge of animal distribution has been increased along many different lines during the year 1898, but the most important contribution to that knowledge has undoubtedly been the publication of Mr. J. E. S. Moore's investigations into the fauna of the great Central African lakes, particularly Tanganyika. Although Mr. Moore set out in 1895, it is only during the past year that the material collected has been worked over, and the results have proven interesting beyond expectation. The discovery of jelly-fish in Tanganyika some years ago was an indication of a peculiar fauna in that lake, resembling in some particulars the fauna of the ocean. Mr. Moore's collections show beyond question that such a fauna not only exists but is quite extensive, and he has designated it as "*halolimnic*." To quote his own words: "The fauna of Lake Tanganyika is to

Population.—As estimated by Federal officials, the population on June 30, 1898, was about 296,000.

DOBSON, WILLIAM CHARLES THOMAS, well known English painter, died January 30, 1898. He was born at Hamburg, Germany, December 8, 1817; educated at the Royal Academy, London; became an A. R. A. in 1860, an R. A. in 1872, and a member of the Royal Society of Painters in Water Colours in 1882. A great number of his pictures have been engraved.

DOCKERY, General THOMAS, died in New York City February 26, 1898. He will be remembered for organizing and leading a Confederate detachment in the Civil War. He was born at Bowling Green, Kentucky, in 1828.

DODGSON, Rev. Dr. CHARLES LUTWIDGE, M. A., mathematician and humorist, died at Guilford, England, January 14, 1898. He was born in 1832. Having graduated at Christ Church, Oxford, with an excellent record, he was ordained in 1861 and for the next twenty years was mathematical lecturer at his *alma mater*. His first publication was *A Syllabus of Plane Algebraical Geometry* (1860); this was followed by *The Formulae of Plane Trigonometry* (1861) and *A Guide to the Mathematical Student in Reading, Reviewing, and Writing Examples* (1864). In 1865 appeared, over the pen name "Lewis Carroll," the book that more than any other made him famous—*Alice in Wonderland*. This book, full of fantasy and whimsical humor, a classic, a delight not only to children but to men and women, was written, it is said, for Alice, daughter of the late Very Reverend Henry George Liddell, sometime Dean of Christ Church. It is difficult for people to believe that the lecturer on mathematics was the author of this quaint and unique work. The approbation with which it was hailed has scarcely diminished in the thirty-five years that have passed since its appearance. The story is told that the Queen on reading it was so pleased that she ordered that Mr. Dodgson's next work be sent to Windsor; Mr. Dodgson obeyed and the Queen received *An Elementary Treatise on Determinants* (1867). Among his subsequent writings are the following: *Phantasmagoria and Other Poems* (1869), *Songs from "Alice's Adventures in Wonderland"* (1870), *Through the Looking-Glass and What Alice Found There*, and *Facts, Figures and Fancies Relating to the Hebdomadal Council* (1871), *Euclid, Book V., Proved Algebraically* (1874), *The Hunting of the Snark, an Agony in Eight Fits* (1876), *Doublets, a Word Puzzle* (1879), *Rhyme? and Reason?* (1883), *A Tangled Tale* (1885), *Alice's Adventures Underground* (1886), *The Game of Logic* (1887), *Curiosa Mathematica, Part I.—A New Theory of Parallels* (1888), *Symbolic Logic* (1896).

It is said that in his latter days he expressed a fear that the excellence of his mathematical labors, which he considered his real life-work, would be obscured by his books of grotesque humor. This will probably be the case, but doubtless the world has received and will continue to receive greater benefit from Lewis Carroll's whimsical fancies than from his learned demonstrations. It was written of him at the time of his death,—“The world will remain convinced that, beneath the pseudonym which has long seemed a real name, there was the soul of a poet of humor, belonging to the great school whose representatives in many ages and countries have been Æsop, Aristophanes, Cervantes, La Fontaine, Goldoni, Molière, Scheffel.”

DOLE, SANFORD BALLARD, jurist, was born in Honolulu, Hawaii, in 1844, his father being an American missionary to the island. After his education in Honolulu and the United States, he was admitted to the Massachusetts bar; he was judge of the Supreme Court of Hawaii from 1887 until the overthrow of the monarchy and the establishment of the provincial government in January 1893. At this time he was chosen Provisional President, and when Hawaii was proclaimed a republic July 4, 1894, Mr. Dole became the first President. In January, 1898, he came to the United States and was welcomed with appropriate honor. It was believed that his mission was to bring about the annexation of Hawaii to the United States. After the resolutions providing for annexation were passed by Congress, President McKinley, on July 8, 1898, made Mr. Dole one of the members of the committee appointed to recommend to Congress suitable legislation for Hawaii. See HAWAIIAN ISLANDS.

DOMINICA, the largest of the Leeward Islands (q. v.), having an area of 291 square miles with a population in 1891 of 27,339. The capital is Roseau, with a population of about 4,500. The chief products are sugar, coffee, spices, lime-juice, cacao, and fruits. The trade of the island having declined, an inquiry was recently made into the causes of the lack of prosperity, and the discontent that was said to prevail there. A change was made in the constitution and the administration of local affairs was placed in the hands of an executive having greater powers than those possessed by the former official. In 1898, the question of accepting financial aid from the imperial government came up for discussion in the legislative assembly. This aid was offered on condition that the crown should have control of the finances. It was at first refused, but later, after the election of the new assembly, was accepted (July 14, 1898).

DONALDSON, Colonel THOMAS C., was born in Columbus, Ohio, 1843; died in Philadelphia, Pennsylvania, November 18, 1898. He served through the Civil War; was register of public lands in Idaho in 1869-75; was a commissioner of the Centennial Exposition, and in 1884 a member of the Republican national committee. He wrote *The Public Domain*, a volume of 2,000 pages, which is the standard reference history of public lands; he was the author of several other books, including *George Catlin's Indian Gallery* and *Walt Whitman, the Man*.

DONGOLA is a province of the Egyptian Soudan with an area, including Khar-toum, estimated at 100,000 sq. m., and a population estimated at 1,000,000. Its capital is New Dongola. It was lost to Egypt in consequence of the Mahdist rebellion, but in 1896 the Anglo-Egyptian expedition under the Sirdar resulted in the restoration of the province to Egyptian rule. See EGYPT.

DREYFUS, ALFRED, the cause of the agitation which has kept France (q. v.) in a tumult throughout the year 1898, was a captain in the 14th Regiment of Artillery, born in Alsace in 1859. At the time of the alleged discovery of his treason he was an officer in the second bureau of the General Staff. It is there that the most important plans affecting army organization and the mobilization of troops are drawn up, and when it was seen that much of this valuable information was communicated to outsiders, suspicion pointed toward Dreyfus. The way in which he was confronted with his accusers was peculiar. On the 14th of October, 1894, he was summoned to the War Office, where he was received by Major du Paty de Clam, in the presence of three witnesses. He was then asked to write a memorandum dictated by du Paty de Clam. This memorandum contained the words of the famous *bordereau*. An arrangement of mirrors in the room made it possible for its occupants to see every gesture and change of expression. As he wrote, Major du Paty de Clam remarked that his hands shook. When the copy was complete the others withdrew from the room, and Dreyfus finding himself alone, noticed a loaded revolver on the table beside him. This of course was interpreted as an invitation to commit suicide. Soon afterwards he was arrested on the charge of high treason, and placed in the Cherche-Midi prison. When the news spread, the public indignation against the supposed traitor rose to a high pitch. He was kept in close confinement, and his counsel, Demange, was not allowed to see him until December 6. On December 19 the court martial began, and the trial was held in secret, and lasted till December 22, resulting in the sentence of military degradation, and transportation for life. On January 4, 1895, he was conducted by a military escort to the courtyard of the Ecole Militaire, and in the presence of a vast crowd which did not cease for a moment to threaten and insult him, the stripes of his uniform were stripped off, and his sword was broken. He was then marched round the courtyard amid cries of "Death to the Traitor." During all this time, notwithstanding threats and cajolery, he protested his innocence, and he continued to protest it and to cry, "Long live France;" in the presence of the angry crowd. On January 19 he was taken to La Rochelle, whence he was shipped to the neighboring Ile de Ré, and on the 10th of March he was transported to the Ile du Diable, off the coast of French Guiana. His wife believed in his innocence from the first. She was the daughter of a wealthy diamond merchant of Paris, and their home was a luxurious one. Upon the arrest of her husband she was threatened by Major du Paty de Clam with all sorts of disasters if she communicated the news to the other members of the family. During the imprisonment of her husband she tried by every means to prove his innocence. She and her husband were permitted by the authorities to carry on a regular correspondence, which, however, was subjected to careful official scrutiny. She worked hard to demonstrate the identity of the hand-writing of the *bordereau* with that of Esterhazy, and she applied twice for a reopening of the case. Her second appeal on September 3, was referred by the Cabinet to the Court of Cassation, when it voted about three weeks later for a revision of the case.

DRIVEN WELLS. See WATER-WORKS.

DRUIDS, UNITED ANCIENT ORDER OF, a fraternal society founded in England in 1781, in America in 1839, has 16 grand groves, 375 sub-groves, and 15,650 members in America. The benefits disbursed since 1847 in this country are \$3,835,248, and in the last fiscal year \$244,669. Peter Schaffrit, St. Louis, is the Supreme Arch;

H. Freudenthal, Albany, Supreme Secretary; and Philip Reichwein, Indianapolis, Supreme Treasurer.

DRUMONT, EDOUARD, the editor of *La Libre Parole* was prominent in the anti-Dreyfus agitation in 1898. He has been one of the most violent of the Anti-Semites in Paris. In the action of the friends of Dreyfus he could see nothing but a desire to support the Jews in their "criminal" policy, and he used the agitation in the Dreyfus affair as a means for stirring up the Anti-Semite feeling. He was born May 3, 1844, in Paris, and has published among other works: *La fin d'un monde* (1886), *La dernière bataille* (1890), *Le testament d'un antisémite* (1891), and *Le secret de Fourmies* (1892).

DRUSES, a people of Syria dwelling on Mt. Lebanon and on Anti-Lebanon to the south of the district occupied by their ancient enemies, the Maronites. They also occupy the district of Hauran. Their number is variously estimated at from 83,000 to 100,000, of whom 50,000 dwell in Hauran. At the close of the year 1895 they revolted against the severe government of the Turks. Hauran was the center of this revolt. The Turks greatly strengthened their troops in that district, but peace having apparently been restored they began to reduce their forces. The banishment of a Druse chieftain in 1896, however, stirred up a fresh revolt in the course of which a Turkish battalion sent out from Suweidah was surprised and cut to pieces by the Druses, and a garrison about 1,000 strong was besieged. The Turks displayed unwonted energy in mobilizing their troops and there was soon an army of 30,000 in the district. In July the Turkish troops gained two victories in the neighborhood of Suweidah, and peace was restored in August.

DUCLAU, M., the head of the Pasteur Institute, came into prominence in connection with the Dreyfus case on account of his efforts to secure revision. He signed the memorial in favor of revision, giving as his reason that whether or not Dreyfus was guilty, it was essential to the cause of public justice that the case should be revised. A fair trial, legally conducted, he thought, was the only way for ending the trouble. He said that France was in a terrible condition if an honorable soldier could be condemned to the worst of all punishments on account of the similarity of his hand-writing to that of a scoundrel. See FRANCE (paragraphs on History).

DUNKARDS, THE, (known also as Tunkers or German Baptists) composed of the German Baptists (Conservative, Old Order, and Progressive) and the German Seventh Day Baptists, had a remarkably prosperous year. The mission work of the church, both home and foreign, especially in India, was satisfactory. The membership in 1898 increased about 5,000.

The total Dunkard denomination comprises 1,116 churches, 2,791 ministers, and 109,194 communicants. Their next National Conference will be held at Roanoke, Va., in May, 1899. The Progressive Brethren held their Conference in Warsaw, Ind. They opened a mission in Dayton, Ohio, paid a part of the debt on Ashland College, Ohio, which was reopened in the autumn of 1898. They have 231 ministers, 160 churches, and 15,000 members. The Old Order Brethren keep no records of any kind and continue their opposition to colleges, high-schools, and Sunday schools.

DUNKIN, EDWIN, F. R. S., F. R. A. S., English astronomer, died November 27, 1898. He was born at Truro, Cornwall, August 19, 1821; was educated privately and in 1838 became a member of the staff of the Royal Observatory, Greenwich, becoming first class assistant in 1856, chief assistant in 1881, and retiring three years later. He was member of council of the Royal Society, 1879-81; president of the Royal Astronomical Society, 1884-86; president of the Royal Institution of Cornwall; 1889-91. Among his published writings are: *On the Probable Error of Transit Observations*, 1860-64; *On the Movement of the Solar System in Space, determined from the Proper Motions of 1,167 Stars*, 1863; *The Midnight Sky: Familiar notes on the Stars and Planets*, 1869; *Obituary Notices of Astronomers*, 1879; *Presidential Addresses*, 1885-86, and 1890-91.

DUPUY, CHARLES, French Premier and Minister of the Interior, succeeding M. Henri Brisson in that position in October 1898, was born at Puy in Auvergne, November 5, 1851. He was educated at the Ecole Normale des Hautes Etudes, and afterward passed many years as a lyceum professor in provincial towns, being for some time a sub-rector in a high school at Ajaccio. His special study has been philosophy. After serving in the Department of Public Instruction he was elected a deputy of the Haute-Loire in 1885, and was re-elected in 1889, 1893, and 1894. In the Ribot cabinet (1892) he was Minister of Public Instruction and in April 1893, was called by President Carnot to become president of the council (Premier) and Minister of the Interior; in December of that year he was elected president of the Chamber of Deputies, and the following May again became Premier, but resigned his office in January 1895. Upon the assassination of President Carnot in June 1894, M. Dupuy was the strongest rival of M. Casimir-Périer, the successful candidate for the presi-

dency of the Republic. M. Dupuy is a Republican in politics; he is opposed to the priesthood and especially to the Jesuits. For an account of the Dupuy ministry of 1898, see FRANCE (paragraphs on History).

DUPUY de LOME. See SPANISH-AMERICAN WAR (paragraph De Lome Incident).

DURYEY, JOSEPH TUTHILL, D. D., pastor of the First Reformed church, Brooklyn, died in Boston, Mass., May 17, 1898. He was born at Jamaica, Long Island, N. Y., in 1832; was educated at Princeton College and Seminary. He was pastor of a Presbyterian church in Troy, N. Y., for three years, going from there to the Collegiate church in New York City. In 1867 he went to the Classon Avenue Presbyterian church, Brooklyn, remaining until 1879, when he accepted a call to the Central Congregational church, Boston. During his pastorate, which continued until 1888, he taught the senior class in philosophy at Wellesley College. From 1888 to 1895 he was pastor of the First Congregational church in Omaha, Neb.; during the hard times of the winter of 1893, Dr. Duryea was active in relieving the sufferings of the poor. He resigned the Omaha pastorate and the same year (1895) became pastor of the First Reformed church, Brooklyn. He was a deep thinker and impressive speaker.

DUTCH BORNEO. See BORNEO.

DUTCH GUIANA, or SURINAM, is a dependency of Holland, lying between British Guiana and French Guiana on the northeast coast of South America. It is divided into sixteen districts whose aggregate area is 46,060 square miles, and had a population at the close of 1895 of about 63,000, exclusive of the negroes inhabiting the forests. The capital, Paramaribo, has about 29,000 inhabitants. The executive authority is vested in a governor with a council consisting of an attorney-general and three members, all of whom are appointed by the crown. Of the representative body, which is known as the Colonial States, four members are appointed annually by the governor, and the rest elected, the ratio being one representative for 200 electors. Besides a judicial court, all of whose members are named by the crown, there are three cantonal and two circuit courts. The chief products are cacao, sugar, molasses, rum, rice, and maize. Gold is found, the mining being carried on chiefly in placers, though recently a few crushing plants have been introduced. The gold taken from the beginning of the mining industry in 1876 to 1896 amounted to 1,307,383 guilders; the production in the latter year was 846,366 grammes. In 1895 there had been 291 concessions covering 264,040 hectares. The amount (in guilders) of foreign commerce, expenditures, local revenues, and the subventions appropriated by the Netherlands government have been as follows:

	Imports.	Exports.	Expenditures.
1894	6,225,076	5,062,814	
1895	5,203,029	5,490,735	2,094,000
1896	5,335,180	4,391,728	2,084,000
1897			2,245,498

	Local Revenues.	Subvention.
1895	1,726,000	368,000
1896	1,775,000	309,000
1897	2,020,739	224,759

The chief items composing the local revenue are import, export, and excise duties, and real, personal, and some indirect taxes. At the end of 1895, the colonial savings bank had a balance of 544,148 guilders. Communication is effected chiefly by small sailing and steam vessels. There is a small militia and navy of a few guard ships and some vessels of the royal navy. The government grants religious liberty, the most prominent denominations having in 1895 the following numbers: Moravian Brethren 27,055; Roman Catholic 10,634; Hindus 9,326; Reformed and Lutheran 8,826; Mohammedans 2,594; Jews 1,225. In 1895, besides a central school of the Moravian Brethren and of the Roman Catholics, there were 19 public schools with 2,131 pupils and 32 private schools with 4,865 pupils.

DWIGHT, TIMOTHY, D. D., LL. D., president of Yale University, on November 17, 1898, tendered his resignation, to take effect at the end of the academic year. This action, explained in the letter of resignation, was based on his conviction that no one beyond the age of seventy ought to continue at the head of a large university. Dr. Dwight was urged by the corporation to remain in office until Yale's bi-centennial celebration in 1901, but he declined to change his decision, and the resignation was accepted on December 13, the corporation adopting resolutions expressive of its high regard for his character and its appreciation of his services to the University.

Along with Dr. Dwight's resignation came that of Prof. George J. Brush, director of the Sheffield Scientific School.

Dr. Dwight was born at Norwich, Connecticut, November 16, 1828; his father was James Dwight, third son of Timothy Dwight, who was president of Yale from 1795 to 1817. After his graduation at Yale in 1849, Dr. Dwight studied theology there and from 1851 to 1855 acted as a tutor in the college. After three years study at Bonn and Berlin, he was called to the chair of sacred literature and New Testament Greek in the Yale theological school. In 1873-74 he was a member of the American committee for the revision of the English version of the Bible. He has been for many years on the editorial staff of the *New Englander*. On July 1, 1886, Dr. Dwight became president of Yale; both before and after his presidency began he did much for both the educational and the financial interests of the institution. He was known as the "great mechanical reconstructionist of Yale" and under him it became a great university, developing and expanding in all departments.

EARTHQUAKES. The earthquakes which are recorded for the United States in 1898 are distributed as follows: Alabama, 1; Arkansas, 2; California, 12; Indiana, 1; Kentucky, 4; Maine, 1; Montana, 1; Nebraska, 1; New Hampshire, 1; New Jersey, 1; Tennessee, 1; Vermont, 1; Washington, 5; Wyoming, 1. Most of these were very slight with the exception of one on March 30 in California, which was felt severely at a number of localities. A curious feature of it was that at San Francisco there was no preliminary tremor. One building 19 stories high swayed, and the water in the bay rose two feet.

Two earthquakes are reported from Cuba, two from Port au Prince, two from Nicaragua, one from Chili, and a severe one from Messina, Italy.

EAST AFRICA is the term applied to the British, German, and Portuguese possessions on the eastern coast of Africa extending from Abyssinia on the north to the British colony of Natal on the south. See the articles **EAST AFRICA, BRITISH**, **EAST AFRICA, GERMAN**, and **EAST AFRICA, PORTUGUESE**.

EAST AFRICA, BRITISH, includes the protectorates extending along the eastern coast between Somaliland on the north and German East Africa on the south, and westward into the interior to the White Nile, which borders on the Congo Free State, and beyond the portion of that river which is north of the Congo Free State into the Bahr-el-Ghazal district, the region the British claim to which was disputed by France in 1898. These protectorates are administered by commissioners and not directly by the imperial government. The British control in this region dates from very recent times. Agreements with Germany in 1886 and 1890 define the southern boundary and an agreement with Italy in 1891, the northern. Roughly estimated the region comprises about 1,000,000 square miles. The sultan of Zanzibar formerly held the entire coast but in 1886 his dominions were limited to a strip ten miles deep extending from Cape Delgado to the Ozi river. In 1888 the Imperial British East Africa Company received its royal charter acquiring jurisdiction over the coast from the Umba to Kipini. It extended its control into the interior and finally was authorized to administer the territories between the Indian ocean and the Equatorial lakes. By 1892 its sway extended as far as Lake Albert Edward and Uganda but the company did not pay and was dissolved in 1895. British protectorates were then declared over its territories and at present (1898) they are divided into (1), the **EAST AFRICA PROTECTORATE**, (2) the **UGANDA PROTECTORATE**, (3) the **PROTECTORATE OF ZANZIBAR**. See the articles on these topics.

EAST AFRICA, GERMAN, the most important of the German possessions in Africa extends from the eastern coast to the interior beyond Lake Victoria Nyanza in the northwest, Lake Tanganyika on the west and Lake Nyassa on the southwest. It has an estimated area of 380,000 square miles and coast lines of about 620 miles and a population placed at 4,000,000. The principal settlements on the coast are Dar-es-Salaam, Bagamoyo, Saadani, Pangani, Kilwa, and Tanga. Its boundaries were defined by various treaties, the terms of which marked as a rule a withdrawal of Germany from tracts formerly claimed. The enterprising geographer, Dr. Peters, has penetrated into this region and a German writer says that had German diplomacy acquiesced in the plans of this explorer the flag of Germany would be waving to-day over Uganda, and the provinces of the Sultan of Zanzibar. Nevertheless the tract of eastern Africa assured to Germany by these treaties is in some respects the most valuable portion of the eastern country. There are valuable forests near the coast containing the mangrove, cocoa plant, tamarind, baobab, etc., and in the more elevated tracts there is an abundance of acacias, cotton trees, sycamores, banyans, etc. The natives raise goats, sheep and cattle and in the more thickly settled portions follow agriculture. Bananas, pulse and maize are raised and there are plantations of coffee, cocoa palms, vanilla, tobacco, caoutchouc, and cacao. The country is said to have great mineral resources including coal, iron, malachite, and salt.

The export trade in ivory has been important, although the writer above quoted (F. Bley, formerly a district governor in East Africa) thinks that the day is not far distant when the elephant herds will be extinct. In the bottom lands of this region the sugar cane, tobacco, rice and spices can be raised in abundance and in some parts the coffee plantations are very successful. In the interior, particularly near the borders of Nyassa, the country has the advantage of moist soil and at the same time a healthful climate owing to the high altitude. A railway already open for traffic from Tanga to Pongwe is being pushed on toward Karagwe, the latter being a Central African state which belongs mainly to the German sphere of influence. The natives are of a mixed Bantu race and are divided into various branches. As a general characteristic they show a tractable disposition, a readiness to work and often a high degree of intelligence. There are Protestant and Catholic missionary societies carrying on active work in the country. Recently there has been a movement to establish in German East Africa a peasant settlement but the work of transplanting the surplus population of Germany to African colonies has not yet been effectively carried out.

EAST AFRICA, PORTUGUESE, extends along the eastern coast of Africa from German East Africa on the north to Tongaland (a dependency of the British colony of Natal) on the south and is cut off from the interior by British Central Africa, British South Africa and the South African Republic (Transvaal). It has an area of about 301,000 square miles and a population of about 3,120,000. It is divided into the districts of Mozambique, Zambezia, and Lourenço Marques. The chief ports are Mozambique, Quilimane, Ibo, Chinde, Beira, and Lourenço Marques. It is governed by a royal commissioner. Its principal railways are the Delagoa Railway (q.v.) and Beira Railway, which when completed will connect Beira, Fontesvilla, Massikesse, and Fort Salisbury. There are about 950 miles of telegraph line.

EAST AFRICA PROTECTORATE, a British protectorate, extending from the Umba to the Juba River and into the interior as far as Uganda, has a population estimated at 2,500,000. Its capital, Mombasa, with a fine harbor, has a population of about 24,700. For administrative purposes the country is divided into four provinces. Its products and principal exports include ivory, cattle and goats, India rubber, grain, copra, gum copal, hides and horns. Trade is said to be on the increase in spite of recent difficulties with the natives. A railway is in process of construction from the coast to Lake Victoria in Uganda. In February, 1898, 120 miles had been completed and in November it was reported that 235 miles were laid, and that the work was progressing at the rate of one-half a mile a day. The completion of this line together with that which is being laid by the Anglo-Egyptian expedition, will open communication through eastern Africa from the Mediterranean Sea to the Indian Ocean. The East Africa Protectorate is administered by a commissioner and consul-general, and each of the four provinces by a sub-commissioner. In 1898 the commissioner and the consul-general was Sir Arthur H. Hardinge. The United States Consular Report published in October, 1898, states that the commercial future of British East Africa is very promising. Mombasa, the capital, has become an important centre of trade. The soil of the country is for the most part fertile and well watered. A great part of the country is a high plateau and the climate is healthful and well suited to the culture of vegetables and fruits.

EATON, WILLIAM WALLACE, died at Hartford, Conn., September 21, 1898. He was born in Connecticut in 1816. He was a member of the State assembly, a State Senator in 1850, and for nine sessions a member of the House of Representatives, being speaker of the House in 1853 and 1873; in 1874 he was elected to the Federal Senate as a Democrat, and in 1882 was Representative in the XLVIIIth Congress. He was one of the best known Connecticut Democrats and had been active in both State and National politics.

EBERS, Dr. GEORGE MORITZ, the eminent German Egyptologist and novelist, died at his home in Tutzing, near Munich, August 7, 1898. He was born in Berlin, March 1, 1837; after a course of study at Göttingen and Berlin, he taught at Jena 1864, and four years later became professor of Egyptology at Leipzig. His special interest in archæology resulted in many valuable discoveries; the best known is probably the scroll dating from the second century B. C., and found by him near Thebes, now named "Papyrus Ebers" (1872-73). Although it is through his novels that Dr. Ebers is most widely known, he was primarily a scholar, and had won a firm reputation in archæology, philology, and general classical erudition before the appearance of his first novel, *An Egyptian Princess*, in 1864. He entered more fully in 1876 upon the less strenuous labor of romantic composition on account of ill health, and by the time of his death his writings were almost equally divided between fiction and learned treatises upon Egyptian, classical, and historical subjects. It is safe to say that Dr. Ebers was among the foremost of contemporary German

novelists. His works show imagination, and considerable emotional power, but lack that high creative force, those unmistakable touches of genius, which mark such widely different writers as Scott and Thackeray, Tolstoi and Daudet. His sixteen novels deal with ancient scenes and characters and not only possess the atmosphere of the times portrayed, but are full of accurate historical detail. The *Egyptian Princess* has never lost popularity and Dr. Ebers's second novel *Uarda* has enjoyed an enormous success. Among his other works are: *Egypt and the Books of Moses*; *Through Goshen to Sinai*; *The Sisters*; *Margery*; *Homo Sum*; *Per Aspera*; *The Story of My Life*; *Cleopatra* (1894); *In the Fire of the Forge* (1895); *In the Blue Pike* (1896).

ECONOMIC ASSOCIATION, AMERICAN, organized in 1885, has 600 members; Prof. Arthur T. Hadley, President; Prof. W. F. Wilcox, Ithaca, N. Y., Secretary. It held its eleventh Annual Session at New Haven, Conn., December 27-29, 1898. The opening address by the President, Prof. Arthur T. Hadley, on "The Relation of Economics to Politics" was an appeal for a more active participation by economists in public affairs. He pointed out that economists have not exercised the same influence during the greater part of the nineteenth century that they had at first, although he saw signs that in the last thirty years they were coming into closer contact with public affairs. To appreciate the slight influence which the conclusions of economic students have had on practical affairs one has merely to notice the tax and currency legislation of this and other countries. In these laws there are seldom traces of careful economic research. To infer from this that the work of the economist is worthless is superficial because motives of self-interest have especial force in the subject matter with which the science of economics deals. In cases where the principles of a science can be quickly subjected to the test of success or failure, Prof. Hadley shows that there is substantial agreement. For instance, at a given time and in a given country there is but one school of law, and lawyers who tried to practice according to another school or to introduce evidence based on other principles, would soon be ruled out. In medicine the case differs somewhat, for the test of success is by no means quick or certain. The best of medicines will only postpone death and the cause of recovery is often obscure. We should, therefore, expect to find what is actually the case, that is, the existence of different schools of medicine. As an illustration of a department of thought in which even greater discretion takes place Prof. Hadley cites theology. Here the test of success or failure is postponed to the next world and we consequently find innumerable schools of thought. In dealing with the complicated affairs of the industrial world a prompt test by success or failure is impossible. Bad economic measures do not at once bring destruction, nor do good ones bring immediate prosperity. If men looked at business affairs in a wholly disinterested and philosophical manner unanimity in economic views would be far more complete. But, as the author of the paper says, political economy has no chance with a man whose only idea on the subject of foreign trade, for instance, is that he can get a higher price for his goods if foreign goods are shut out, or with the man who assumes as an axiom that the tariff is robbing him. Prof. Hadley suggests that if a large part of the human race thought that the sun's revolution around the earth put money in their pockets, nothing would ever convince them that the earth revolved around the sun. These considerations explain the comparative lack of influence which men who devote their whole lives to the study of economics have upon actual legislation. In spite of them, however, he thinks that an increasing proportion of the population are ready to pay some attention to the teachings of economists.

The president's address was followed by the presentation and discussion of the report prepared by a special committee of the Association on the "Scope and Methods of the Twelfth Census". The report contained many suggestions regarding methods for improving the statistical work in future censuses, pointing out incidentally certain defects of method in previous censuses, especially in that of 1890. (See article CENSUS.) As bearing further upon statistical matters two specific questions were presented (1) "Is it Possible to Get Statistics of Capital and Industry?" (2) "What May and Should the Statistics of Municipal Finance Be Made to Show?" The discussion on the first was led by Hon. S. N. D. North, Hon. Horace Wadlin and Prof. H. C. Adams; and on the second by Prof. H. B. Gardner, Prof. L. S. Rowe, and Dr. M. R. Maltbie.

On December 29th an important report was presented by the Association's Special Committee on Reform of the Currency. This report advances practically the same ideas as those put forward by the Indianapolis Monetary Convention two years ago, and it supports these ideas by practical and lucid statements. It recommends an explicit declaration of the gold standard in order to remove any doubt on that point. It shows the helplessness of gaining elasticity for our currency under present conditions; for with \$800,000,000 of paper currency to be kept at par it is impossible that

our currency should quickly respond to the demands of trade. Such a currency does not contract or expand in the quick, automatic manner that is required under the fluctuating conditions of modern business. It cannot be exported nor can it be augmented except by artificial means. The report dwells on the need of a banking system that shall provide a currency that is at once safe and elastic. It emphasizes the view already expressed by practical business men that the supply of money in parts of the country remote from business centres is a matter of great importance, and should be afforded by the establishment of small banks of issue and deposit, or of branch banks. It finds one of the causes of the "cheap money" movement in this scarcity of currency in certain parts of the country at certain seasons. Such a stringency is the most conspicuous feature of the existing currency in those parts and it is natural that those who suffer from it should jump to the conclusion that "cheap money" is the proper remedy. An elastic currency, by removing this evil would, it is thought, bring men to sounder views on the whole subject of currency. The report points out that the general prosperity at the close of the year 1898 makes prompt action most desirable for business is in the best possible condition to stand the change.

On this same subject of the currency, Prof. F. W. Taussig, of Harvard University, read a paper entitled "*Some Aspects of the United States Treasury Situation in the Years 1893-1897.*" The following were some of its important points: The paper states that between November 1895, and October 1896, the Treasury held in its vaults continuously \$100,000,000 and more of legal tender. These notes began to accumulate in 1894, but the great body of them came in in 1896. Prof. Taussig says that although this must have been the result of deliberate policy on the part of the administration, yet, strange to say, not one word concerning it had been said in the official Treasury Reports. It was the outcome of the depression following the crisis of 1893 when the currency was redundant. It was the crude but temporarily effective device for avoiding the difficulty entailed by the so-called "endless chain." During this time of redundancy the notes paid out returned promptly to the Treasury. By impounding them the Treasury put an end for a time to the excess of the circulating medium. "This artificial elasticity was secured only at the expense of the great bond issues of 1894-96, and the uncertainties which accompanied these troublesome operations." When business began to revive at the end of 1896 there was a demand for these legal tenders and the notes which had been accumulated were now issued and remained in circulation. Prof. Taussig thinks that the same thing may happen whenever depression recurs. He points out the likeness of the situation in 1894-96 to that in 1884-86. In the latter period it was the silver currency which the Treasury hoarded. The author concludes with an account of the disadvantages under which the Treasury labors so long as this system is maintained. It is responsible for a great mass of silver and paper currency and has no means of adapting its issues to the demands of trade.

Space will not permit the summary of the other important papers read before the Economic Association but their titles and the names of the writers are as follows:

Early Canal, Railway and Banking Enterprises of the States, in Relation to the Growth of Corporations in the United States. G. S. Callander, Harvard University.

Prices and Price Movements in the Confederate States During the Civil War. Professor J. C. Schwab, Yale University.

Recent Economic Changes in the State of Massachusetts. Professor C. S. Walker, Massachusetts Agricultural College.

Dynamic Standards of Wages and Interest. Professor J. B. Clark, Columbia University.

The Present Study of Practical Labor Problems in France. Dr. W. F. Willoughby, United States Department of Labor.

Municipal Taxation as a Means of Public Control of Corporations. Mr. C. E. Curtis, City Bank, New Haven, Conn.

The Nature of Municipal Franchises. Dr. Max West, U. S. Department of Agriculture.

ECOLOGY. See BOTANY (paragraph Ecology and Plant Geography).

ECUADOR, a republic lying between Colombia and Peru on the Pacific coast of South America, consists of sixteen provinces and one territory, whose area aggregates about 120,000 square miles. No census has been taken, but according to the last official estimate the population was 1,271,861; of these 100,000 are of Spanish descent; 300,000 of mixed blood (Spanish and Indian); and 870,000 are Indians. The most populous province is Pichincha with 205,000 inhabitants, and the least populous, Esmeraldas with 14,553. The capital is Quito (population 80,000); the other important towns are Guayaquil (50,000), Cuenca (25,000), Riobamba (12,000), Ambato Loja, and Latacunga (each about 10,000).

Government.—Ecuador became an independent state upon its withdrawal from the original Republic of Colombia in 1830. Its present constitution, framed in 1882 and modified in 1887, is modelled somewhat on that of the United States. The executive authority is vested in a president who is assisted by a cabinet of five ministers; the president and vice-president are elected by popular vote for terms of four years, but the elections are not simultaneous, the one being two years subsequent to the other. The president and cabinet together with seven others form a council of state. The president in 1898 was Gen. Don Eloy Alfaro. The legislative power devolves upon a congress consisting of a senate and a house of representatives, members of the former being elected for four years, one-half retiring every two years, there being two senators chosen from each province; and members of the latter, or deputies, being chosen for two years, at a proportion of one deputy for each 30,000 inhabitants. Legal electors for both senators and deputies, as well as for president and vice-president, are adults who can read and write and are Roman Catholics. Governors appointed by the government administer the provinces. Besides inferior courts, which deal with civil, criminal, and commercial cases, there are the appellate courts, comprising six superior courts at different places and the Supreme Court in Quito. There are 33 cantonal and 359 parochial justices and consular courts at Quito and Guayaquil. The president receives an annual salary of 12,000 sucres and each minister 2,880 sucres.

Finance.—The ordinary revenue from June 1895 to July 1896, was 5,128,620 sucres, and the extraordinary revenue, which was chiefly loans from banks, was 3,730,740 sucres, the total being 8,859,360; expenditure for same period was 8,779,520 sucres. For both 1897 and 1898 the revenue was estimated in sucres at 9,093,551 and the expenditure at 11,005,141. About 70 per cent. of the revenue is derived from customs; the greater part of the remainder comes from taxes on cocoa, white rum, tobacco, real estate, and from government monopolies, rents, and the postal department. The foreign debt is about 7,890,000 sucres (about \$3,440,000) and the internal debt (1896) is 7,500,000 sucres (about \$3,270,000).

Army and Navy.—The army comprises one brigade of field and one of fortress artillery, one regiment of cavalry, four battalions of infantry and two columns of light infantry, aggregating in all 3,341 officers and men. There is said to be a national guard of 30,000 men. The navy is made up of a torpedo launch and a transport.

Industries and Commerce.—The country, situated directly under the Equator, is essentially agricultural, and an immense variety of tropical flora grows most luxuriantly; it is said also to be rich in precious metals, silver, quicksilver, copper, iron, lead, coal, and petroleum, but the mining industry has not made great progress. Among the principal exports are cacao, coffee, rubber, hides, cinchona bark, vegetable ivory, and tamarinds. The chief products also include, along the coast, all kinds of tropical fruits, and, in the cultivated parts of the interior, sugar cane, cereals, cabinet woods and dyewoods, and the stemless screw pine from which the well known Panama hats are made. In the early part of 1898, it was reported that almost all of the accessible rubber forests had been exploited, and it being feared that this industry might soon come to an end it was necessary to begin the cultivation of the rubber tree. A newly proposed railroad to Quito will open up large areas of original rubber forest. Manufacturing industries are but little developed; there are, however, flour, sugar, cotton, and hat factories, sawmills, tanneries, and distilleries. Cacao, the staple product, in 1895 was received at Guayaquil to the amount of 16,122 tons and in the following year 15,327 tons. The principal imports are cotton and other textiles and provisions. The following has been the value in sucres of foreign trade; the figures for 1894 and 1895 refer only to Guayaquil:

	1892.	1893.	1894.	1895.
Imports	8,377,897	10,052,163	12,000,000	8,520,000
Exports	12,086,185	14,052,514	13,933,750	11,562,740

In his annual message to the congress August 9, 1898, President Eloy Alfaro reported that the general condition of the country was improving. He reported a reorganization of the statistical department of the custom house,—so that hereafter the customs reports may be trusted,—and he stated that the exports of 1897 were nearly 50 per cent. greater than those of the preceding year. The figures that he gave for foreign trade were:

	Exports.	Imports.
1896	21,862,324 sucres (\$9,138,451)	
1897	31,025,382 sucres. (\$12,968,609)	18,004,048 sucres. (\$7,525,692)

President Alfaro said that, on account of the constant underestimation of values at the custom house, the actual amounts for 1897 were probably 25 per cent. higher than the figures given above. Thus the true value of the imports was at least 22,000,000 sucres (\$9,196,000). The government proposed to raise the official valuation upon which duties are calculated and a commission was appointed for the purpose.

Efforts have recently been made to promote the cultivation of the rubber tree in the hope that the rubber crop might be made to equal the cocoa and coffee crops which have been hitherto the chief products of the country. The ruthless destruction of the wild rubber tree has led to the scarcity noted in a preceding paragraph. A report of the United States Consul-General dated February 26, 1898, states that Ecuador produces every known species of the rubber tree in great abundance, and that planting is easy and inexpensive. Steps have been taken to obtain from the government an eight-year concession covering eight or ten square leagues of land in the province of Tungurahua. The Consul-General says: "The thousand and one uses to which rubber is now applied renders it one of the most valuable products of these countries, and offers a tempting field for United States investment. The barbarous methods referred to, in use by ignorant 'Cholos' and semi-savage Indians, will undoubtedly be replaced by civilized and intelligent processes. There are immense tracts of land in Ecuador suitable for rubber cultivation which can be had for a mere song, and I am satisfied that President Alfaro would warmly welcome American capitalists and settlers. The latter should have sufficient means to support themselves until the tree reaches maturity. Living in this country is very cheap, nearly everything growing spontaneously. Food is inexpensive and but little clothing is necessary. Should the projected railroad to Quito become a reality, immense tracts of rubber forests will be rendered available for exploitation which at present are too remote to be utilized."

Shipping and Communications.—In 1896 there entered at Guayaquil 450 sailing vessels, representing 20,643 tons, and 394 steamers, representing 256,933 tons; total, 844 vessels, 277,576 tons. During the same period there cleared from Guayaquil 469 sailing vessels; representing 17,297 tons, and 402 steamers, representing 257,053 tons; total, 871 vessels 274,350 tons.

The forests and mountainous surface of Ecuador render internal communication difficult. The roads are usually merely bridle paths. To some extent the inland waters are navigated by a few steamers of American or native build, while there is a large number of accessory small boats and canoes. There is one railroad, 58 miles in length, connecting Durán (opposite Guayaquil) with Chimbo. In the latter part of 1897 a contract was made between the government and a New York capitalist for the extension of this road to Quito, the capital of the Republic. Much difficulty will attend the successful completion of this enterprise, for the route proposed, which is 404 miles in length, rises at points to as much as 12,300 feet above the sea level, and crosses so many streams and ravines that, it is said, the construction of 830 bridges will be necessary. The estimated cost of the road is \$17,500,000.

There are about 1,242 miles of telegraph lines and 60 stations; a telegraphic marine cable touches at Guayaquil.

Religion and Education.—The state religion is Roman Catholic, and provision is made for the church in the annual budget. Other faiths are excluded. The schools of Ecuador according to the latest statistics available in 1898 were: nine of higher education, 35 secondary, and 1,088 primary; primary education is free and compulsory. The teachers number in all 1,498, and the pupils, 68,380. At Guayaquil and Quito there are commercial and technical schools, besides in the latter city a university which has 32 professors and 216 students.

Money.—As Ecuador has no mint, the national currency is coined at Birmingham and in Chile and Peru. The amount of silver minted in 1890 was valued at £77,000; in 1892, £43,000. The silver coinage for the four years ending 1889 was about 1,835,000 sucres. There is no gold in circulation. The sucre is worth \$0.436 in United States gold (estimate October 1, 1898). There are two banks of issue, having an aggregate capital of 2,400,000 sucres; there are also other banks, one of which has a capital of 2,000,000 sucres.

EDUCATION IN THE U. S. The United States in founding in 1867 the national Bureau of Education at Washington set an example to the whole world. The work of this bureau is the collection and dissemination of information concerning education primarily, but it has also the administration of the schools of Alaska (q. v.) and a limited supervision of the expenditures for land-grant colleges. The Commissioner (W. T. Harris, appointed 1889) issues an annual report covering in two volumes of over 1,000 pages each, as far as possible the whole educational field during the preceding year. Tables from the last report issued January 1899, showing the main statistics of education, are here appended:

Statistics of State Common School Systems, 1895-1896.

	Pupils enrolled.	Average number of pupils attending school each day.	Average number of days the schools were kept during the year.	TEACHERS.			Estimated value of all school property.	Total expenditure during 1895-1896.
				Male.	Female.	Total.

^a Does not include professional students, which are given in the statistics of professional schools.

^b Includes 2,100 private high schools and academies, with 107,468 secondary students, and 5,108 public high schools, with 408,488 secondary students. The public high schools are also included in the table giving statistics of State common-school systems.

^c The city school systems are also included in the table giving statistics of State common-school systems.

Higher Education in the U. S.—A strong movement has been inaugurated towards making more uniform the conditions upon which the degrees, ordinarily given by the great universities, are granted by many colleges and self-styled universities in the South and West, some of which are little if at all better than high schools. In New York and Pennsylvania charters may not be given to institutions whose work does not come up to the required standard. A strong protest is being made against the undue multiplication of honorary degrees with the same title as those which are generally supposed to be granted only after a course of study. Among these degrees that of Master of Arts (M. A.) is the most ambiguous and following that is the degree of Doctor or Philosophy (Ph. D.) which has been given as an honorary degree at numerous institutions. The commonest honorary degree is that of Doctor of Divinity (D. D.) which was given as an honorary degree to 323 persons in 1897. The Federation of Graduate Clubs of America has passed resolutions condemning the granting as honorary degrees those about which a strong tradition has grown up that they should be given only after a number of years' study after obtaining the baccalaureate degree (B. A.) and upon examination. The resolutions above mentioned state "that bachelor degrees are inappropriate as honorary degrees or *ex gratia* and should be made to signify always the completion of a recognized grade of undergraduate work in their respective departments" and that the degrees of Ph. D., Sc. D., Pd. D., and M. D., should never be given *honoris causa* nor *in absentia*. L. H. D., S. T. D., D. D., LL. D., D. C. L., and Mus. D., are recognized as honorary degrees.

The great attention given to philosophical subjects in the post-graduate work of the different universities of the country is shown by the fact that in the twenty-four prominent universities of the United States, which enrolled in 1897-8 a total of 3,204 graduate students, 519 chose philosophy and ethics. History, politics and law followed with 488 students and English came third with 423. After these, in the order mentioned came (4) Classics; (5) Economics, Sociology and Anthropology; (6) Psychology and Pedagogy; (7) German; (8) Biology; (9) Mathematics; and (10) Chemistry; after which the list includes Romance languages, Physics, Geology and Geography, Indo-Iranian and Comparative Philology, Semitics, Astronomy and finally the Fine Arts and the History of Art.

The special technical and professional courses of study given by universities and colleges not themselves technical schools, are numerous. The professional instruction given in the greatest number of colleges, where the liberal education is the prime object, is in music, courses in which are offered by 328 colleges. Commercial courses may be taken at 216 institutions, Pedagogy at 211, Art at 175, Military Science at 104, Civil Engineering at 92. Theology at 90, and the following courses show most frequency in the order mentioned: Law and Mechanical Engineering, (73 colleges each); Electrical Engineering (70 colleges); Medicine (57 colleges); Agriculture (53 colleges); Domestic Science (34 colleges); Mining Engineering (33 colleges); Pharmacy (30 colleges); Veterinary Science (27 colleges); Dentistry (22 colleges); Architecture (16 colleges) and Sanitary Engineering (12 colleges).

Higher education is given in the U. S. in 472 colleges and universities for men and for both sexes, and in 14 for women only. These institutions employ 10,946 male and 1,592 female officers of instruction, and have an attendance of 116,401 male and 38,690 female students. This makes one college student to every 831 persons in the U. S. The largest proportion of college students is found in the Western States where there is one student to every 580 persons. In Nevada one out of every 268 of the population is a college student, in California one out of every 425, in Massachusetts one out of every 471.

The universities and colleges above mentioned have 382 fellowships, 5,463 scholarships, have libraries with 6,668,046 bound volumes and 1,737,981 pamphlets, scientific apparatus valued at \$16,014,347, grounds and buildings valued at \$120,142,990 and productive funds amounting to \$114,212,392.

The 14 colleges for women employ 248 male and 313 female officers of instruction, register 4,421 students, have 16 fellowships, 276 scholarships, and libraries aggregating 164,839 volumes.

For a complete list of universities for men, for women and for both sexes, see UNIVERSITIES AND COLLEGES.

Manual Training Schools.—In 95 cities of the U. S. a course in manual training was an essential feature of the instruction in the public schools. In 1896-7 there were 66 manual training schools with 551 teachers and 12,123 male and 7,718 female pupils. Instruction in the manual arts is provided for by law in many of the States of the Union, among them being Maine, Massachusetts, Connecticut, Georgia, Indiana, New Jersey, New York, Utah, Wisconsin and Wyoming; and appropriations are made by Congress for the support of manual training schools in Washington, D. C.

Commercial and Business Schools.—In the U. S. there were 93,931 students in commercial courses in various schools in 1896-7, of whom 56,002 were in the business and commercial courses of universities, colleges, normal schools, private high schools

and academies and public high schools and 37,929 in the commercial courses of business schools. There were 341 business schools with 1,764 instructors and 77,746 students, nearly a fifth of whom were in evening classes. The distribution of the students according to studies were as follows:

Course of study.	Males.	Females.
Commercial course.....	29,216	8,713
Amanuensis course.....	10,185	12,957
English Course.....	9,653	3,671
In telegraphy.....	897	312

Normal Schools.—In the year 1896-7 there were in the U. S., according to the latest report of the commissioner of education published Jan., 1899, 83,934 students pursuing training courses for teachers of whom 49,199 were in 164 public normal schools. Of the students in these schools 30,592, or more than 70 per cent., were women. The north Atlantic division, had 77 per cent. of the public normal schools of the U. S. the greatest number being in New York and Pennsylvania. In the public normal schools there were 1,800 colored students, the largest proportion of these being in the colored normal schools of the two southern divisions. The public normal schools were supported by State, county and city appropriations of nearly two million and a half of dollars, in addition to their income of half a million of dollars from tuition and over \$350,000 from other sources.

There were 198 private normal schools with 1,719 teachers and 24,181 students, about an equal number of men and women, with an income of \$1,026,077, libraries with 223,067 volumes and buildings, grounds and apparatus valued at \$6,911,131.

Besides this there were 2,650 men and 3,833 women pursuing training courses for teachers in 196 colleges and universities, 2,490 male and 6,511 female students of teaching in 507 public high schools, and in 422 private high schools and academies there were 3,068 male and 3,996 female students pursuing teachers' training courses. The total number of such students in schools other than the public and private normal schools was 22,544.

Subjoined is a table showing the distribution of normal students in the U. S.:

CLASSES OF INSTITUTIONS.	1894-95.		1895-96.		1896-97.	
	Institutions.	Students.	Institutions.	Students.	Institutions.	Students.
Public Normal Schools.....	155	36,276	160	40,421	164	43,199
Private Normal Schools.....	201	21,927	169	20,777	198	24,181
Public Universities and Colleges....	26	1,075	27	1,691	30	1,899

Private High Schools.....	458	9,124	439	7,980	433	7,064
Grand total.....	1,439	80,538	1,408	84,400	1,437	88,934
In all public institutions.....	614	44,160	634	50,358	701	54,089
In all private institutions.....	825	36,378	774	34,042	736	35,895

Education of the Colored Race.—In the District of Columbia and 16 Southern States there were 1,460,084 colored children enrolled in public schools in the year 1896-7. this enrollment being 32 per cent. of the children of school age in those States; but 52 per cent. of the colored children of school age in these States were enrolled in the public schools. In three States, South Carolina, Louisiana and Mississippi, the colored school population is greater than the white school population. In Kentucky a greater proportion of the colored children attend school than of the white children. There were 27,435 colored teachers in the Southern States. In the U. S. there are 178 schools for the secondary or higher education of colored youth, 160 of which are in the Southern States; they employed 1,795 teachers, and had an enrollment of 45,402 more females than males; they had libraries aggregating 224,794 volumes and grounds and buildings valued at \$3,714,958.

Education of the Blind.—The first school for the blind in the U. S. was established in Boston in 1829. Thirty-two States now have such schools in successful operation. The last report of the U. S. Commissioner of Education (issued Jan., 1899) shows 336 schools for the blind with 387 instructors and 3,630 students of which 1,860 were in industrial departments where cane seating, mattress making, carpet weaving, machine sewing, typewriting, etc. are taught. These schools had libraries aggregating 95,879 volumes and grounds and buildings valued at \$6,183,538.

Education of the Deaf.—There were 95 schools for the deaf with 1,020 teachers and 10,429 students. There were 54 State public schools with 817 instructors and 9,391 students, who were taught in articulation, auricular development, and in industrial branches. The schools for the deaf had libraries aggregating 90,184 volumes; had scientific apparatus valued at \$21,394, and grounds and buildings valued at \$11,373,873.

Education of the Feeble Minded.—There were 28 schools for the feeble minded, with 492 teachers and 496 assistants, and 8,534 pupils. Instruction was given in three directions, moral, intellectual and industrial. There were 10 private schools for the feeble-minded with 101 teachers, 64 assistants and 357 pupils. Music among other branches is taught to 1,474 pupils out of the total given above.

Reform Schools.—In 1896-7 there were in the U. S. 88 reform schools with 485 instructors and 23,696 inmates. The value of grounds and buildings was \$16,319,017. Of the inmates 2,639 were colored, and 5,722 of foreign parentage. A large proportion could neither read nor write when admitted. All those discharged could both read and write, and three-quarters of them were reported as leading honest, respectable lives.

EGYPT. *Population and Area.* Trustworthy figures for the present population of Egypt are not obtainable, but there is evidence to show that in recent years the numbers have increased. In 1875 its population was 6,000,000 and in 1898 it was estimated at between 9,000,000 and 10,000,000. The capital, Cairo, has a population of about 570,000 and the commercial centre, Alexandria, of about 320,000. The area of Egypt is placed at 394,240 square miles, being about equal to that of the North Atlantic and South Atlantic States of the United States.

Foreign Commerce.—In the twenty-one years from 1875 to 1896 the imports of Egypt rose from \$25,000,000 to \$50,900,000, being an increase of over 100 per cent. The following table from the Consular Reports of October 1898, shows the imports by countries:

Country.	Value.
England and possessions.....	\$18,508,700
Turkey	9,958,000
France and possessions.....	6,060,000
Austria-Hungary	3,512,000
Belgium	2,296,000
Russia	1,852,000
Italy	1,659,000
Germany	1,408,000
Greece	405,000
United States.....	215,540

In 1896 the total exports were valued at \$68,000,000 and consisted chiefly of cotton, cotton seed, cane sugar, beets, onions, skins, and natural wools. About 35 per cent. of the exports were sent to England. The trade of the United States with Egypt has greatly increased in recent years. In 1896 it amounted to \$4,632,000 and in 1897 to \$7,489,243, consisting in the former year almost entirely of cotton and in the latter of cotton and sugar. In 1898 it was \$6,629,173. The Egyptian cotton trade has increased with extraordinary rapidity. It rose from 339,222 bales in 1875 to 680,960 in 1896, England receiving almost half of this amount. Egyptian cotton was introduced into the United States but ten years before and the growth of the trade has been remarkable. The American Consul General at Cairo drew attention in 1898 to the importance of the Egyptian market to American firms. With the opening up of Dongola he declared that an increase in the importation of textiles and other goods is certain to take place. The advantage possessed by England and Germany in Egypt, as in several other foreign markets, is said to be due to their maintaining agents in the country who understand the language, and to their refusing to rely exclusively upon trade circulars. Communication with the United States has been improved since the establishment of the new American Indian Line which passes through the Suez Canal and will stop at Suez whence there is railway connection with Cairo and Alexandria. The kinds of goods preferred by the Egyptian purchaser as shown from the list of imports from England, France and Germany, include all sorts of tools and agricultural implements, articles of carpentering, wooden ware, mining and milling machinery, sewing machines, wagons, stoves and ranges, and in short all such articles as advanced industrial communities are able more advantageously to produce. The use of machinery is gaining ground in Egypt and an increasing demand for its importation is probable. This of course means an increasing importation of coal which already forms an important item in the list of imports.

Egypt under British Control.—It will be remembered that in 1875 the English and French governments in the interest of the holders of the Egyptian debt induced the

Khedive to admit to his counsels two financial advisers, the representatives of the respective governments. It was hoped that by these means the financial condition of Egypt might be placed on a surer basis, but matters went from bad to worse and in 1877 a further attempt was made in the interest of the foreign bond-holders. At this time Ismail Pasha went so far as to promise to turn Egypt into a constitutional monarchy and to entrust the chief portfolios to French and English ministers. With the capriciousness of an Oriental despot the Khedive soon grew tired of this arrangement and dismissing his ministers resumed his former personal rule. The so-called "dual control" came about in this manner. The Egyptian government was induced to give jurisdiction over all civil cases involving Europeans to international tribunals which were to administer justice according to the new civil code. Now this code contained a clause that in the event of a suit against the state the property of the latter might be seized in the same way as the property of a private person. This was a most unusual principle, and one totally at variance with the principle of sovereign rights. Ismail Pasha claimed that this clause was inserted in the code without his knowledge. However that may be, it is certain that on finding it out he flew into a passion and declared that he had been betrayed. The significance of this clause appeared when a German bond-holder in whose favor an international court had pronounced proceeded under the judgment of the court to seize the properties of the state in default of payment of arrears. The Egyptian government opposed this action, but the German government interposed on behalf of its subject, threatening armed intervention if the latter's rights were not respected. Thereupon France and Great Britain, acting in harmony, required the Sultan to depose Ismail Pasha, thus re-establishing the sovereignty of Turkey over Egypt. Ismail was forced to abdicate, and his son Tewfik became Khedive. But the fallen ruler soon found a means of revenge. As a result of his instigation the officers of the army mutinied, and soon afterwards occurred a revolution headed by Arabi Pasha. The fanatical hatred of the Mohammedans for the Christians was an element in this revolt and led to the massacres at Alexandria which aroused the indignation of Europe. It was necessary that order should be restored, but as France refused to intervene, the task of suppressing the revolution devolved on Great Britain. To her alone belongs the credit of having pacified the country. British ships bombarded Alexandria; the British army defeated the Egyptians at Tel-el-Kebir; Cairo was re-occupied and Tewfik was restored to the throne. Thus Great Britain was forced into the position of the guardian of Egypt. It was a duty not relished by the ministry at that time. Neither Mr. Gladstone, nor his colleagues desired permanent occupation of Egypt by British forces; all that they wanted was the restoration of order and the establishment of authority until Egypt could take care of herself. Many thought that if Great Britain had at this time established formally a protectorate over Egypt it would have proved more advantageous to all parties concerned than the wavering and seemingly transitory arrangement which was effected. British troops garrisoned Cairo and Alexandria, and British officials gave aid and advice to the Khedive's government, but it was all done with the understanding that in a short time they would be withdrawn and Egypt would be left to shift for herself. The mistaken gentleness of Great Britain's policy in dealing with the defeated revolutionists weakened her influence on Egypt. According to Oriental ideas of justice Arabi and his fellow conspirators had justly forfeited their lives, whilst their sentence consisted merely in a mild form of banishment which was tempered by liberal pensions. Lord Dufferin was sent to Egypt to report on the condition of the country, and especially to answer the question how soon it would be safe to withdraw British control. He reported that the organization of Egyptian affairs was such that for the present at least it would be unsafe for the British to withdraw their guiding hand, but that it was possible within a few years that the country would be able to govern itself.

Internal Progress.—In spite of their insecurity of tenure the British officials did their best to improve the administration of the country. Progress was not rapid at first, and many mistakes were made, but soon beneficial effects of the British rule became apparent. For several years, however, it was thought that at any moment the ministry would leave Egypt to her fate. It was not until nearly the close of the last decade that it was realized that Great Britain had come to stay. For more than fifteen years Egypt has been virtually a British protectorate. It is an important question whether the condition of the country has improved under this system. Much light has been thrown on this question by the publication in the year 1898 of valuable statistical estimates by Sir Edwin Palmer, the financial adviser of the Khedive. The returns cover the period from 1892 to 1897, but as they were for the first time available in the spring of 1898 the discussion of them is appropriate to the present year.

In the first place, as to the increase of population. The population of Egypt from 1882 to 1897 rose from 7,000,000 to nearly 10,000,000, nor is this increase due to foreign emigration, since the number of foreigners has risen only some 20,000. The increase of population proves an improvement in the condition of the people, for it

means a falling off in infant mortality, better sanitary conditions and economic advancement. The area of taxable land in Egypt increased from 5,000,000 acres in 1882 to about 5,600,000 acres in 1897, that is, nearly three per cent. This improvement has made it possible to reduce the land tax without reducing the revenue. The arrears of the land tax have been paid off and the extortions practised by the Fellaheen have been abolished. Although the indirect taxes have not been increased they have yielded a far larger return on account of the increased consumption resulting from the improved condition of the mass of the people. The traffic returns on the railways increased from 1,300,000 pounds in 1881 to 2,000,000 pounds in 1897; the post-office receipts increased about fifty per cent. and the number of letters posted has nearly doubled. No doubt this is largely due to the fact that throughout this period Egypt has enjoyed peace and tranquillity, but this very fact is to be set down to the credit of the British control, for under the former style of government so long a period of quiet and good order was not to have been expected. There is no doubt that the financial condition of the country has been vastly improved under British direction. British officials have shown themselves competent, courageous and conscientious; they have done away with old abuses and administered affairs with honesty.

At first thoughts it is a matter of surprise that the railway mileage of Egypt during this period has increased to the extent of only 212 miles, but this is explained by the fact that in the settlement concluded between Egypt and her creditors, the state railways were virtually mortgaged for the payment of the public debt. Fifty-five per cent. of their gross receipts are applied to this purpose, so that the working expenses of the road must be made out of the forty-five per cent. that remains. But although mileage has not increased, the passenger traffic has grown enormously, rising in fifteen years from 3,000,000 to 9,500,000. In irrigation and the construction of drains both in lower and in upper Egypt the British authorities have made great advances. In education it cannot be said that any very radical changes have been effected, but if the extent of newspaper circulation is an indication of intellectual improvement in the masses, the signs of the times are hopeful, for the number of newspapers posted during the fifteen years in question has increased by about 5,000,000. British ideas of justice are incomprehensible to the Oriental mind, which dislikes technicalities and the observance of rules and would have the judge decide on principles of equity. The complex system of English law worries the native mind, and the improvement which has been made in the administration of justice may not have permanent effects. Nevertheless this progress has been considerable. British criminal justice is administered, and examination under torture and various other barbarous customs that prevailed before the occupation, have been abolished. As to the condition of the large cities also improvements have been made in the matter of buildings and in sanitary arrangements. The streets of Cairo have been widened and public works of many kinds have been successfully carried out.

The Alleged Results of British Occupation.—The Hon. Edward Dicey, to whom we are indebted for many of the foregoing facts, sums up the effect of the British rule in Egypt in the following paragraphs:

"To sum up, under our occupation Egypt has been rendered solvent and prosperous; taxes have been largely reduced; her population has increased by nearly 50 per cent.; the value and the productiveness of her soil has been greatly improved; a regular and permanent system of irrigation has been introduced into Lower Egypt, and is now in the course of introduction into Upper Egypt; trade and industry have made giant strides; the use of the Kurbash has been forbidden; the Corvée has been suppressed; regularity in the collection of taxes has been the rule, and not the exception; wholesale corruption has been abolished; the Fellaheen can now keep the money they earn, and are better off than they were before; the land-owners are all richer owing to the fresh supply of water, with the consequent rapid increase in the salable price of land; justice is administered with an approach to impartiality; barbarous punishments have been mitigated, if not abolished; and the extraordinary conversion of Cairo into a fair semblance of a civilized European capital has been repeated on a smaller scale in all the chief centres of Egypt. To put the matter briefly, if our occupation were to cease to-morrow, we should leave Egypt and the Egyptians far better off than they were when our occupation commenced.

"If, however, I am asked whether we have succeeded in the alleged aim of our policy, that of rendering Egypt fit for self-government, I should be obliged honestly to answer that in my opinion we have made little or no progress towards the achievement of this aim. The one certain result of our interference in the internal administration of Egypt has been to impair, if not to destroy, the authority of the Khedive; of the Mudirs, who, as the nominees of the Effendina, rule over the provinces; and of the Sheiks, who, in virtue of the favor of the Mudirs, govern the villages. We have undoubtedly trained a school of native officials who have learnt that it is to their interest to administer the country more or less in accordance with British ideas.

Here and there we may have converted an individual official to a genuine belief in these ideas. But I am convinced that if our troops were withdrawn, and our place in Egypt was not taken by any other civilized European Power, the old state of things would revive at once, and Egypt would be governed once more by the old system of Baksheesh and Kurbash. Indeed, the last state of the country would be worse than the first, as the old generation of Egyptian statesmen have fallen into the background under our occupation, and the younger generation have so far not exhibited the intelligence, or the vigor of their predecessors. The simple truth is that Egypt, in common with almost all, if not all, Oriental countries, has no desire for self-government; and that even if such a desire existed, self-government is not an art that can be taught by foreign supervision and control."

This view of the improving conditions of Egypt is borne out by the report of the United States official representative in that country. As an instance of the improvement in the condition of the masses the fact is cited that the land tax, which was formerly \$24.00 a feddah (about an acre) is now \$7.50, and that the bonds of the Suez Canal, the interest on which could not be paid in the time of Ismail Pasha, are now selling at 106 and over. It is estimated that since 1883 the average value of the crop has increased \$4,000,000 per annum. In 1898, 5,000,000 acres were said to be under cultivation. The railways are all government property with the exception of a short line near Alexandria and another between Port Said and Ismaila. In 1898, the railway mileage was 1,400. The management of the railway is entrusted to an administrative board, whose members consist of a chairman, who is an Englishman, and two others, who are respectively French and Egyptian. Concessions have been made to companies for the construction of light railways in several of the provinces. As to inland navigation, the traffic on the Nile and in the Delta is considerable. The roads have been improved and the use of vehicles is becoming more common. See COTTON AND THE COTTON INDUSTRY.

HISTORY.

The Soudan.—The Egyptian Soudan contains the following provinces: Dongola, Khartoum, Sawakin-Massawan, Kordofan, Darfur, Senaar, Equatorial Province, Fazocli, Bahr-el-Ghazal, Zeilah, Harrar, Berbera.

According to the *Statesman's Year Book* for 1898, the area was 950,000 square miles, and the population was 10,400,000, but these figures are probably based on loose estimates. Before the Mahdist rebellion the Egyptian Soudan was placed under a governor-general whose capital was Khartoum, but under the Mahdi and his successor the Khalifa, the Egyptian power waned and the region was divided into various districts under the control of the native rulers. British influence was acknowledged as extending over a great part of this territory by agreements concluded with Italy and Germany, but since the Mahdist revolt the country has declined in prosperity and population, and the Equatorial Province has sunk back into barbarism.

The Anglo-Egyptian Expedition.—Since 1896 the attention of the world has been attracted to the attempt of the British to restore their authority in this region and to reclaim it to civilization. In 1896 an expedition commanded by the Sirdar, Sir Herbert Kitchener, started southward along the Nile with the object of occupying the province of Dongola. It followed a novel plan, proceeding in a leisurely way up the river and completing railway and telegraph lines as it went. Gunboats and other vessels accompanied it along the river. The expedition was thoroughly successful, largely no doubt owing to this method of progress. The Dervishes offered little resistance and the Egyptian forces having seized Dongola, September 23, 1896, regained control of the entire province. Throughout 1897 the advance continued, the Dervishes retiring before the invaders, and the country was occupied as far as Berber. This city as well as Abou Hamed was occupied. Reinforcements were sent to the expedition. Care was taken to keep the railroads open in the rear, so that new troops and supplies could arrive when needed.

Battle of the Atbara.—As the troops advanced up the Nile the Dervishes crossed the river at Shendy and marched upward as if for the purpose of meeting the British and Egyptian troops at Berber, but in the meanwhile the gunboats captured Shendy and cut off the supplies of the Dervishes. The latter, 20,000 strong, occupied an entrenched position at the junction of the Atbara river, and the Nile. At day-break of the morning of Friday, April 8, 1898, General Kitchener in command of some 13,000 troops, of whom all but a few battalions were Egyptians, attacked the enemy's position and drove them from the field inflicting a loss of some 2,000 men. The British loss was slight. Among the British troops there were but few casualties, but the Egyptians lost fifty or sixty men killed and between three and four hundred wounded. The leader of the Dervishes, Emir Mahmoud, was captured. Osman Digna, however, who commanded another body of the Dervishes, managed to escape. The severe losses of the Dervishes were due largely to the effective work of the Maxim guns with which the British forces were equipped.

Battle of Omdurman.—The marvellous precision of General Kitchener's movements

had made it possible to know distinctly beforehand what would occur and to know it almost to the date. It was prophesied long beforehand that before the middle of September the Khalifa's power would be overthrown, Gordon avenged and Omdurman taken. So it turned out. General Kitchener himself is said to have miscalculated the time of the vital and decisive battle by only one day. The army of occupation continued to advance steadily up the river driving the Dervish scouts before them until within eight miles of Omdurman. The invading army was drawn up in a line about four miles long with the English troops on the right and centre, the Soudanese on the left, and the Egyptians as reserves. It was not expected that the Dervishes would begin the attack so early, but General Kitchener was prepared for that or for any other event. The Dervishes attacked the English flank with the same bravery as they had shown at Atbara. They were mowed down in vast numbers by the Maxim guns, and yet they returned to the attack again and again. Then they attacked the left but were repulsed, and upon the arrival of the Egyptian reserves they were driven back in confusion. The fighting lasted until sundown. The Khalifa and Osman Digna then fled with the English cavalry in hot pursuit. On September 7 General Kitchener notified the War Department that his officers had counted 10,800 dead Dervishes, that the wounded were estimated at 16,000 and the prisoners between 3,000 and 4,000. The English and Egyptian losses were reported as 46 killed and 333 wounded. Omdurman was occupied by the British. This city, it will be remembered, was the Mahdi's capital after Khartoum was destroyed, the stones of the latter being used in the construction of the new town. It is just across the river from Khartoum and has become a large and thriving city. The British also occupied Khartoum where a memorial service was held in honor of General Gordon. The companions of Gordon had for the most part been killed. Some white prisoners, however, were found by the British. Among them was Karl Neufeld who had been for many years a captive and had undergone every kind of humiliation and hardship. General Kitchener's success was made easier by the fact that the Khalifa, the Mahdi's successor, was a tyrannical ruler and there was little disposition on the part of the people to take up arms on his behalf. One remarkable feature of the battle was the charge of the Twenty-first Lancers, who finding themselves wholly surrounded by the enemy, hacked their way through a greatly superior force. Although many chose to speak triumphantly of this victory as avenging Gordon, the expedition must be regarded as undertaken for better motives than revenge. The reconquest of the Soudan was certainly for the benefit of civilization. The seizure of these provinces by the Mahdists shut off a prosperous and promising country containing some 12,000,000 of people from all improving influences. Under the rule of Mahdism the country was desolated, agriculture and trade died out and it is said the population was reduced nearly one-half. The admirable management of the Kitchener campaign attracted attention all over the world. In the United States it occasioned in some quarters remarks on the contrast which it presented to the alleged mismanagement of the United States forces in the war with Spain. Certainly the charges of nepotism and political jobbery which were heard in regard to the latter war had no parallel in the case of the Kitchener expedition. It was efficiently officered; the troops were well cared for; everything was provided at the right time and the campaign was conducted as smoothly and precisely as if it had been rehearsed a dozen times beforehand. The comparison, however, is most unfair because the Anglo-Egyptian expedition had been planned for a long time and there was no such haste needed in carrying it out. It must be remembered also that previous British expeditions had failed and that the good sense shown in this case was in part the result of bitter experience.

The French at Fashoda.—Hardly had Gen. Kitchener won the battle of Omdurman and occupied the adjacent city of Khartoum, when news was brought by the captain of one of the Khalifa's steamers that Fashoda, some 350 miles further up the Nile, was occupied by a white force. It was at once supposed that this force was that of Major Marchand, which had been pushing toward the Nile from the French Congo (q. v.). This conjecture proved to be correct, when Gen. Kitchener, having sent the press correspondents all to the rear, reached Fashoda on September 19. Major Marchand with a small force was in possession and had hoisted the French flag and when General Kitchener demanded that he should withdraw, Major Marchand refused to do so without orders from his government. He said that he had been directed by the French government to occupy the district of the Bahr-el-Ghazal and the country on the left bank of the Nile as far as Fashoda; moreover, that he had made a treaty with the native chiefs of the latter region and that this treaty had been sent to his government for ratification. General Kitchener formally protested against the occupation and reminded Major Marchand that with their scanty ammunition and supplies his small following would have been cut to pieces by the Dervishes had it not been for the British victory. Alarm was felt in political circles when the rumor of this affair was spread. It was represented that Major Marchand would not withdraw and that France intended to retain Fashoda. It was therefore believed that a con-

fact would take place between the British troops and the members of Marchand's expedition and that France and England would be involved in war. For an account of the diplomatic complications and the discussion in the press to which this affair gave rise, see the articles GREAT BRITAIN and FRANCE (paragraphs on History). It is sufficient here to state that the French government transmitted a message to Marchand directing him to send a report as to what had happened. The report had already been sent but Major Marchand decided to return to France himself. He reached Cairo on November 3. Two days later it was announced by Lord Salisbury that the French government had decided to withdraw their forces from Fashoda. Further comment on Kitchener's victory and the discussion of the British policy in Egypt will be found in the articles to which reference has been made. For an account of archaeological explorations in Egypt, see the article ARCHÆOLOGY.

ELCHE, BUST FROM. See ARCHÆOLOGY and SCULPTURE.

ELECTRICAL ENGINEERING IN THE UNITED STATES (1898). The capital invested in the various electrical industries in the United States at the present time is estimated at about \$1,900,000,000, of which a fair proportion is devoted to manufacturing industries. Electric generators up to 4,600 kilowatts (6,100 horsepower) capacity are now produced at about 2 cents per watt output, whereas in 1882 the cost was 20 cents per watt. In the same way weights have been reduced, and where in 1884, 6 watts output was produced per pound now 10 watts per pound are obtained.

Formerly the cost of generating a kilowatt hour of electric energy by steam was somewhere near 7.5 cents; at the present energy produced in the same way for street railway purposes costs only about one cent per kilowatt hour. Electricity obtained from water power is still cheaper, and in the case of the Niagara Falls plant is furnished to customers in Buffalo as low as $\frac{2}{3}$ of a cent per kilowatt hour, delivered. The cost of incandescent lamp bulbs has been reduced from \$1.00 for a 16 candle power lamp to 18 cents; and while the maximum attainable candle power under commercial conditions was 0.20 candle power per watt we now obtain 0.25 candle power per watt.

Voltages for incandescent work have increased from 110 to 220, and even 500 volts. Incandescent arc lamps have come into quite general use, and the present forms of enclosed lamp, in which the carbons are in a nearly air-tight globe, burn from 100 to 150 hours with one trimming, where formerly 16 hours was the usual limit; carbons for these lamps have decreased in cost from 6 to 2 cents apiece. It is estimated that fully \$600,000,000 is at the present time invested in electric lighting stations in the United States.

A few years back accumulators or storage batteries were limited to 3.4 watt hours per pound of electrodes, with an energy efficiency of about 69 per cent. when discharged at a current density of 12 amperes per square foot of negative plate surface. The present figures are from 5 to 6 watt-hours per pound of storage cell, and an energy efficiency of 85 per cent. when discharged at a current density of 4.8 amperes per square foot of negative plate surface. The total capacity of storage battery plants in the United States is estimated at about 56,000,000 watt-hours. The efficiency and materials used in street car motor work have been greatly improved, and to-day the output of these motors is 14 watts per pound of motor, where formerly 5 watts per pound was the limit. The 14,000 miles of electric railway track of the country represent an investment, including all related departments, of about \$100,000,000, and give employment to 170,000 men.

Electric transmission of energy now includes plants aggregating an output of over 30,000 kilowatt, or about 200,000 horse-power. Alternating current apparatus, such as generators, motors and transformers, have been greatly improved; and in the latter case outputs of 100 watts per pound of material are now obtained. In telegraphy recent returns indicate that there are in the United States 1,000,000 miles of telegraph wire, calling for 200,000 miles of pole line, with 25,000 offices. The capital invested is estimated at \$150,000,000.

Telephony has received a wonderful impetus; and it is not uncommon to carry on conversations over distances up to 1,500 or 1,800 miles. All told there are about 1,000,000 telephones in use, with 400,000 stations, and 900,000 miles of wire. It is estimated that 17,000 persons are engaged in central stations, and that they daily make 3,000,000 connections. The capital invested in this industry is close to \$100,000,000. Practically all city lines are now underground, and it is estimated that 100,000 miles of this character of lines have been installed in the last few years.

Electro-chemical processes of producing aluminum, sodium and other alkalies are rapidly increasing; and the past year saw 150,000 tons of material produced in this way.

ELECTRICITY ON SHIPBOARD. The use of electricity on board vessels, either naval or merchantmen, except for certain special details, is identical with its

use on land. Its use in any one case is naturally limited, and the equipment of each vessel, no matter how large or small, is complete in itself. Its introduction into all classes of marine service has been rapid and most satisfactory, and to-day there is no vessel, from a small cruising yacht to a battleship or great ocean liner, which is without an electrical equipment. These are duplicated in part to avoid the possibility of a shut-down, which in the case of ocean liners or warships might mean great inconvenience and danger.

Marine isolated plants include high-speed steam engines directly connected with compact direct current generators wound for voltages varying in different cases from 50 to 80 volts in the naval, to from 50 to 110 in the merchant service. Engines and generators are most carefully designed, and as a rule are capable of very heavy overload to accommodate electric winches, etc.

Current is taken from the generators to the switchboard and thence to all parts of the vessel where needed, in feeders which are usually well insulated and protected in iron pipes, owing to the very destructive effect of salt water. On warships there are two circuits, the lighting and the battery or machine operating, the latter serving only when the vessel is in action. Owing to the corrosive action of salt water and ocean air, unusual precautions are taken with switches, lamps and other fixtures.

Besides the ordinary use for lighting, the ease with which wires possessing no heat, which will not freeze, and in which there is no danger, can be led about, and the compact form and adaptability of electric motors, have caused their use for operating blowers for ventilating purposes, portable pumps and tools, deck hoists, ice and refrigerating machinery, and for opening and closing waterweight doors, etc., functions which formerly belonged to compressed air, hydraulic, or steam motors. More recently on warships electricity has been adopted to operate ammunition hoists, turn turrets, handle heavy guns and torpedo-discharging apparatus. Experience has shown that for ventilating purposes the electric motor directly connected to the fan is by all odds the best means, since they can be put in corners and out-of-the-way places, and require no hot steam and exhaust pipes. For rapid repairs portable motors are of great service. Portable pumps are also used. Deck winches and derricks for loading and unloading are now replacing the old style steam winch.

Other uses are the telephones and engine signals; and these are extensively used in both naval and merchant service. The experience on the United States vessels with these and other delicate devices, during the recent war with Spain, has raised a serious question as to their value in the navy. It was found that the telephones were too delicate, and that the shock due to the recoil of the large guns soon threw them out of order. In the same way the range finders and firing signals, proved of questionable value. However, the search-light, electric ammunition hoists, ventilators and electric turret moving equipments made a most excellent showing.

In the merchant marine, where the conditions are not so exacting, electricity has been used with great success for all the purposes outlined. An example of the way ships of to-day are equipped is afforded by the *Grand Duchesse* of the Plant Line, which runs between New York and the Southern ports of the United States.

In the engine room are two 20 kilowatt generators, and a complete switchboard with 16 main circuits, 10 of which lead to small switchboard; in various parts of the ship to which are connected branch circuits, none with more than 8 lights. The other circuits, are for power and special purposes, such as the searchlight and coal conveyors. The latter are operated by two 12 kilowatt motors, and consist of conveyor buckets for loading, and a coal trimming device. This has a capacity of a ton per minute. The valve of the steam steering engine is operated by a telemotor, which is in turn controlled by a switch in the pilot house, which also contains a helm indicator, a device for showing the position of the rudder. A system of lights on the inside of the roof of the pilot house is so connected to the various signal lights that when any one of them burns out or goes out the corresponding light on the roof is switched in and a buzzer begins to hum. An annunciator near at hand is connected with 14 thermostats distributed throughout the cargo space of the ship to give warning of fire. There is also a telephone system, with a central station, and 150 instruments.

ELECTRIC CARRIAGE. See AUTOMOBILE.

ELECTRICITY AS AN ANÆSTHETIC. See ANÆSTHESIA and PSYCHOLOGY, EXPERIMENTAL (paragraph Yale University).

ELECTRIC LIGHT AND POWER STATIONS. The increasing use of electricity for lighting and power purposes during the past two years, has been a direct result of certain changes in the method of producing current. In the older stations installed several years ago, small high-speed engines non-condensing were either belted to small high-speed low voltage generators, or large slow-speed engines were used to drive long and heavy countershafts or jackshafts from which belts were run to the same type of small generator. This system has been abandoned in favor of the

(General Electric Co.)

better method of directly connecting large slow-speed compound or triple expansion condensing engines to large generators. This reduces the number of units and enables a considerable saving to be made in the operation of the station owing to the higher efficiency of these larger engines and generators. The accompanying table affords an idea of the electric lighting industry. The consolidation of various electric lighting, railway and power companies in various parts of the country, has also permitted the construction of larger and larger stations into which have been introduced all manner of labor saving machines, such as economizers, feed water heaters, coal and ash conveyors, etc. Besides the steam operated plants, a number of hydro-electric or hydraulic plants have been installed. One of this type—The Hudson River Power Co., at Mechanicsville, N. Y.,—is described further on in this article. These hydraulic plants are rapidly being introduced whenever sufficient water power can be obtained. They find their principal use in the western part of the United States and in Switzerland. In practically all of the recently installed power plants and many of the lighting systems, poly-phase alternating current is generated at workable voltages from 500 to 1,000, and is transformed by means of either static or rotary transformers to voltages as high as from 10,000 to 33,000 volts. In this form it is transmitted to sub-stations, where by means of transformers, converters, the pressure is reduced to a safe and convenient value. Indications are that there will be a gradual increase in the voltages, and consequently the length of transmission lines. An example of a lighting station operated in this way is afforded by the Edison Electric Illuminating Co. of Brooklyn, N. Y., where the generating station or Union Station is at Bay Ridge, N. Y. This main station is 206x120 ft. of brick and iron construction with an ultimate capacity of 60,000 horse-power. It contains at present one 3,000 horse power McIntosh & Seymour steam engine directly coupled to a 2,000 kilowatt General Electric generator; a 1,500 horse-power Hamilton Corliss engine and a 1,000 kilowatt three-phase generator and a 300 horse-power engine of the same make. Three-phase current is generated at 6,600 volts, 25 cycles, and is transmitted over cables in suitable underground conduits to 3 large stations containing engines and generators, and 7 sub-stations. In these are located transformers, which reduce the pressure to that suitable to operate induction motors which are connected to arc light generators for street lights, and direct low tension machines for incandescent lighting in stores and houses, and for charging the storage batteries with which each station is equipped. The total capacity of the system on Jan. 1, 1898, was 103,591 16 candle-power incandescent lamps, 4,032 low tension arc lamps, 3,702 horse-power of motors and 1,939 high tension arc lamps. In all some 30 miles of triple conductor or 90 miles of cables are used in the distribution from the central station.

An example of an hydraulic station and transmission plant is afforded by the Hudson River Power Co., Mechanicsville, N. Y. This plant includes a main dam of concrete—16 ft. high, 8 ft. thick at the crest, 16 ft. thick at the base, and 800 ft. long; connecting two concrete abutments, the eastern one being 20 ft. long, 26 ft. high, 16 ft. thick at the top and 34 ft. thick at the base; the western one being 257½ ft. long upon which is built the power house. In this portion are built 7 chambers—5 of which contain double 42 in. turbine each pair of 1,000 horse-power which connect to 5 three-phase generators of 750 kilowatts each, of the revolving field stationary armature type. Each of these generates alternating current of 36 amperes at 12,000 volts at a periodicity of 38. The current is carried to a large and well arranged switchboard from which the feeder circuit are controlled. These are three 210,000 B. & S. bare copper wires running to the great works of the General Electric Co. at Schenectady, N. Y., where transforming machinery drop the pressure and change the form of the current to that suitable for operating the immense factory of the company.

ELECTRIC LIGHTING. See GARBAGE.

ELECTRIC RAILWAY. Within the past two years the conduit electric railway has received considerable attention as a result of the successful operation of the experimental lines in New York City and in Washington, D. C., installed in 1895. The indications are that the trolley roads will be abandoned in favor of the conduit system, at least in the large cities. Cable railways have seen their day and are being converted to conduit electric systems. The accompanying table affords an idea of the extent to which electric railways have been adopted in the United States.

Far too many railway systems were installed during the year to attempt to describe all in this article. It will suffice therefore to describe certain typical roads.

Hoboken Shore Ry.—This was opened on Jan. 4, 1898. It extends about two miles along the Hudson River from Hoboken to Weehawken, N. J., and connects the wharves and docks. It is an electric road used for freight handling and the switching of cars to and from warehouses. The electric locomotives were built by the General Electric Co., Schenectady, N. Y., and have the following dimensions: length over all 29 ft., width 8 ft., height 13 ft., distance—centre to centre of trucks, $12\frac{1}{3}$ ft. There are two 4-wheel trucks each having two 85 horse-power motors giving a total of 540 horse-power or a draw bar pull of 10,000 lbs. at a speed of 8 miles per hour when fully loaded. The locomotive weighs 57,000 lbs. and has a 3 horse-power motor and compressor for air valves and whistle. The usual railway voltage of 500 is employed.

The Chicago and Milwaukee Ry.—This extends a distance of 31 miles from Evanston, Ill. to Waukegan, Ill. passing through 15 suburban towns, having a population of about 75,000. It is parallel and close to the shore of Lake Michigan. It is single track, but will be doubled in the near future. The track is of 65-72 lb. rails and 85 lb. girder sections, all 60 ft. long, with oak ties laid in broken stone and slag ballast 18 in. centre to centre. Overhead trolley of number 00. B. & S. copper is used with feeders running from sub-stations distributed along the line. The power station is centrally located, and will ultimately contain 2,000 horse-power in 3 horizontal engines and 8 boilers and 5—250 kilowatts, 5,000 volt three-phase generators. Feeders radiate from this station to the several sub-stations in which transformers and rotary converters will transform the current direct and reduce the voltage to 500 volts. The sub-stations will also contain storage batteries for a reserve as well as to help at times of heavy load.

Buffalo and Lockport Ry. Co.—This company was organized in April 1898 and operates 29 miles of track, feeding the Erie R. R. and connecting Tonawanda, Lockport and Buffalo, N. Y. It employs heavy overhead construction of the usual type, 500 volts. For passenger traffic there are 10 electric motor cars of from 20 to 25 tons weight equipped with 4 motors, each car with a total power of 208 horse-power. These are run on a half-hour headway. For freight service, two 36 ton electric locomotives capable of handling a 340 ton train at about 15 miles per hour are employed. These have the following dimensions: Length over all 32 ft., height of cab over rail 12 ft., distance between centre of trucks 13 ft., wheel base (1 truck) 6 ft., gauge 4 ft. $8\frac{1}{2}$ inches, diameter of wheels 36 inches, number of motors 4, horse-power of each motor 160. Draw bar pull at full load and speed 3,400 lbs. Current for operating the road is taken from the Niagara Falls power over a substantial transmission line of three No. 0000. B. & S. bare copper conductors at 10,500 volts to Lockport, N. Y., where a sub-station containing 6—150 kilowatts air-blast transformers and two 400 kilowatt, 500 revolutions rotary converters drop pressure from 10,500 alternating to 500 volts direct current at which it is fed to the trolley lines over suitable feeder circuits.

The Zermatt-Gornergrat Electric Rack Ry.—This road is 5.6 miles long, and starting from Zermatt, Switzerland, it ascends 5,248 ft. in its length of 5.6 miles, to the summit of Gornergrat, which has an elevation of 10,286 ft. above sea level. The road employs the "Abt" rack system with overhead trolley. Trains consist of an electric locomotive and two carriages seating 110 passengers, and weigh all told 63,800 lbs. and require 180 horse-power to move them up the steep grade which is 20 per cent. at a rate of 4.34 miles per hour. The road includes a steel arch viaduct 394 ft. long resting on two masonry piers 151 and 171 ft. high. Power is obtained from the Findelenbach river, a head of 333 ft. being secured. Water is led 656 ft. in a canal cut in the rock and in a steel pipe line 2.95 ft. in diameter and 656 ft. long with an incline of 30° . The power house includes three 250 horse-power horizontal turbines with a speed of 400 revolutions per minute direct connected to 5,400 volt three-phase generators. Current is carried over a suitable transmission line to the two sub-stations. In these and the central station are transformers dropping the pressure to 540 volts at which it is fed to the two trolley wires.

The Jungfrau Electric Railway.—This is an electric road extending to the top of the Jungfrau peak, the highest of the Jungfrau group of the Swiss mountains. The road starts from Little Scheidigg at an elevation of 7,000 ft., and by means of a succession of tunnels and an elevator passes up to the top of the Jungfrau peak which has an elevation of 13,670 ft. above the sea level. There are 5 stations, including the Observation House on the peak, which are formed by running the tunnel close to the precipitous mountain side and cutting windows through to the outside thus affording ventilation and a magnificent view. The tunnel has a total length of 6.7 miles with a section of 150.6 sq. ft. Most of the distance it will be unlined, but in parts where the rock is uncertain, a heavy masonry lining will be built. The train consisting of one car holding 40 persons will be propelled by an electric locomotive having a heavy gear engaging a rack placed between the track. Current for opera-

ting will be generated at Lauterbrunnen, $4\frac{1}{2}$ miles from the entrance, where a hydraulic power plant has been installed. Three-phase current is generated at this station and transmitted to sub-stations distributed along inside the tunnel where transformers and rotary converters will drop the pressure to 500 volts direct current, at which pressure it will be fed to the trolley lines to operate the locomotives.

Sketch showing location of Jungfrau Electric Railway.

It is estimated that the total cost will be \$1,930,000 and that 10,000 passengers will be carried the first year. The fare has been limited by legislation to \$8.68 for the round trip. It is understood, however, that only \$6.75 will be charged.

The following table gives the elevation of the different stations and the distances between them:

Distances between stations, elevation and gradients of the Jungfrau railway.

STATION.	Height. Station to Station.	Feet above sea level.	Distance. Station to Station.	Miles from start.	Maximum gradient per cent.
Little Scheidegg.....	6,770
Eiger Glacier.....	840	7,610	1.2	1.2	25
Eiger Wand.....	1,610	9,220	0.9	2.1	25
Ebnedal.....	1,140	10,360	1.5	3.6	25
Jungfraujoch.....	860	11,240	2.6	6.2	61
Elevators.....	2,330	13,490	1.7	7.9	25
Summit.....	240	13,670	7.9	Vertical.

The following table gives comparative figures for three types of American electric locomotives.

SERVICE.	London-Central— Rapid Transit.		Baltimore & Ohio— Heavy Freight and Passenger.		Hoboken Shore R. R. — Switching	
	Feet.	Inches.	Feet.	Inches.	Feet.	Inches.

Weight, lbs.....	84,000	162,000	67,000
Rated tons.....	105	1,300-1,900	295

*With load.

The London engines are for tunnel work hauling light rapid transit trains. They have continuous frames and are mounted on two 4-wheel swiveling, driving trucks. The B. & O. engines consist of practically two separate engines coupled back to back each having two axles mounted rigidly in the frames so that the pivoted truck system is eliminated. The Hoboken Shore engine has a continuous frame and is mounted on two 4-wheel trucks. Overhead trolleys are used in all cases.

Europe is awaking to the convenience of electric street railways and within the past two years American manufacturing companies have installed trolley roads in many of the cities of the old world. The trend of electric railway progress seems to be towards longer lines and the use of poly-phase transmission with sub-stations distributed along the line to transform the alternating current to direct current which is supplied to the third rail, underground conductors or trolley, as the case may be. For city service several magnetic or surface contact railways have been tried both here and abroad. So far these have proved unsuccessful. Although it is quite possible, that within a few years a practical and satisfactory surface contact system will be developed. See CONDUIT ELECTRIC RAILWAYS; RAPID TRANSIT; ELECTRIC LIGHT AND POWER STATIONS; and ELECTRIC WELDING.

ELECTRIC VEHICLES. See AUTOMOBILE.

ELECTRIC WELDING OF STREET RAILWAY RAILS. This was first attempted in a practical way in 1893 at Boston, Mass., Cleveland, Ohio, Johnston, Pa., Brooklyn, N. Y., St. Louis, Mo., and Detroit, Mich. The work did not prove entirely successful owing to the injury to the molecular structure the steel rails caused by the intense but necessary heat. A series of experiments was conducted by the company con-

Electric Welding Street Railway Rails. Diagram showing Apparatus and Connections.

trolling the patents, which resulted, it is maintained, in the discovery of a method whereby this difficulty is eliminated. In the past year 45,000 ft. of track were welded for the Nassau Electric Railroad of Brooklyn, N. Y., with satisfactory results. The process is as follows:

The welding equipment, consisting of 4 cars provided with motors, trolley, etc., is run out on the track to be welded. The sand blast car, containing a compressor, sand blast, etc., precedes and cleans the rail joints which have been exposed by excavating the earth for a space about them, and from which the splice or argyle plates have been removed. The "welder" is simply a large transformer with jaws which can be clamped upon the rail. This comes next and a bar of steel 19x3x1 inches is clamped in this way on each side of the rail, using a pressure of 1,400 lbs. Current is then turned on, and allowed to flow for about two minutes during which time the 30,000 or 50,000 amperes heat the splice bars and rail web sufficiently to cause the metals to flow and the bars and rail firmly to unite. Current is then turned off and the clamping pressure increased to 35 tons under which the weld is allowed to cool. Three welds per joint are required, each involving the same process.

The two other cars mentioned contain a machine known as a "booster" which is necessary to steady the varying voltage of the current taken from the trolley wire, and a rotary converter which transforms the 500 volt direct to 300 volt alternating which is transformed by the welder transformer to from 2 to 4 volts and 30,000 to 50,000 amperes; this current strength being required to heat the rail and bars to the fluid state.

ELECTROLYSIS OF GAS AND WATER MAINS. This is the corrosion of underground pipes due to the action of electric currents which escape from electric trolley railways and electric lighting or power circuit that uses a ground return. These leakage currents seek the shortest and best route to return to the power house from which they start. This path is usually along the water and gas mains in the vicinity

of the track. When the current enters these pipes, no destructive action is apparent, but at all points where it leaves the pipe, electrolysis occurs. The extent of this action is dependent upon the amount of the leakage current and the character of the soil surrounding the pipe. A soil containing any corrosive material, such as salt, will greatly accelerate the action. The great danger resulting from electrolysis of this character is the weakening of underground structures to such an extent that accident may result. In the case of water mains, they may burst when most needed, when a fire is raging, for instance, and thus add to the disaster. Although observed in the early days of electric street railway work, the full importance of preventing this destructive action was not realized.

During the year several careful tests were made notably at Dayton, Ohio, and Jersey City, New Jersey, and as a result of these and previous tests, it is quite certain that insurance companies throughout the country will increase the rate of premium in towns and cities when the overhead trolley is in use.

ELECTROMAGNETIC THEORY OF LIGHT. See PHYSICS (paragraph Electromagnetic Waves).

ELECTRO-THERAPEUTIC ASSOCIATION, AMERICAN, organized in 1891, for the cultivation and promotion of knowledge of whatever relates to the use of electricity in medicine. The next annual meeting will be held at Washington, D. C., September 19-21, 1899. President, Francis B. Bishop, M. D.; secretary, John Gein, M. D., of Auburn, N. Y.

ELEMENTS. Seven new chemical elements have been discovered during the year 1898: neon, krypton, metargon, xenon, polonium, coronium and etherion. Each is considered under its name in this work.

ELEUSIS. See ARCHÆOLOGY (paragraph Greece).

ELEVENTH ARMY CORPS ASSOCIATION, organized in 1890, at Portland, Me., had at the close of 1898 a membership of 100. President and historian, Col. Aug. C. Hamlin, vice-presidents, Gen. John T. Lochman, Col. Thomas Reilly, Capt. A. B. Searles, and Gen. L. P. Di Cesnola; treasurer, Capt. F. Wernock; and secretary, Capt. Francis Irsch, 1 Old Slip, New York.

ELIOT, SAMUEL, LL. D., ex-president of Trinity College, Hartford, Connecticut, died in Beverly, Massachusetts, September 15, 1898. He was born in Boston, December 22, 1821; having been graduated at Harvard in 1839, he traveled in Europe for four years; became in 1856 professor of history and political science at Trinity and was president 1860-66. In 1874 he accepted the chair of political science and constitutional law in the same institution. He had previously been a lecturer at Harvard, and headmaster of the Boston Girls' High School; he was superintendent of the Boston schools 1878-80. Dr. Eliot published in 1847 *Passages from the History of Liberty*, which two years later he enlarged under the title *The Liberty of Rome*, and finally republished with additional volumes, as *The History of Liberty*, in 1853. He also published in 1856 a *Manual of United States History*.

ELIZABETH, EMPRESS OF AUSTRIA. ELIZABETH AMELIE EUGENIE, wife of Franz Josef, Emperor of Austria-Hungary, was assassinated by an Italian anarchist calling himself Luccheni, on September 10, 1898, as she was walking from her hotel in Geneva to the lake, where she was expecting to embark. The assassination was made possible by the fact that the Empress, according to her custom, was traveling without attendants, being accompanied only by her lady in waiting. Luccheni, who had come to Geneva to murder some other person of royal blood, but, failing in this, had for a day or two been waiting for the Empress, rushed from behind a tree as she passed and stabbed her in the breast with a stiletto which he had made out of a file. The Empress fell, but recovering herself succeeded in reaching the boat, which immediately put out from the shore. The boat returned, however, for the Empress presently lost consciousness, and she was taken to the hotel, where it was found the steel had touched her heart. She lived but a few minutes.

Luccheni, who was immediately apprehended, gave no reason for his act except that he was a starving anarchist who loved the poor and hated the rich. He was reported to have said in a letter to a Milan newspaper that he had committed the deed "in order that such crimes, following one upon the other, might cause all who impoverish the populace to tremble and shiver." He expressed no regret for having killed an old and inoffensive woman; he said, "Above all, it is the great who must be struck. Not only sovereigns and their ministers will be reached by the comrades, but all who make men miserable on earth. . . . I am an anarchist by conviction." He was twenty-five years old, had been a soldier in the Italian army, and at the time of the assassination was a member of a band of anarchists who a short time before had met in Zurich to plan the death of several European rulers, chief among whom were King Humbert, of Italy, and President Faure, of France. The crime, so brutal, so meaningless and cowardly, appeared even worse from the fact of its being com-

mitted in Switzerland, the country that has generously allowed itself to be an asylum for so many refugees and which has abolished capital punishment.

The immediate result of the murder was a spontaneous outbreak not only of the people and the press, but of the governments of Europe, against anarchism. Emperor William of Germany, along with many others, were in favor of an international effort to seize all anarchists and banish or otherwise dispose of them. Such an attempt to deal with anarchism would doubtless be very poor statesmanship, but the European authorities were driven almost into a state of frenzy by this murder, so atrocious in itself, and following so closely upon the assassinations of President Carnot, of France, and Señor Canovas, the Spanish Prime Minister. Luccheni was convicted at Geneva and on November 10 sentenced to imprisonment for life.

The death of the Empress was a great blow to the old Franz Josef, and seemed to be the culmination of a series of misfortunes to the House of Hapsburg. Among these are the death of Franz Josef's brother, "Emperor Maximilian," who was shot by the order of President Juarez of Mexico, in 1867; the death of the Emperor's only son, Rudolf, which was either murder, suicide, or the result of a duel, at Meyerling, in 1889, after he had shot the Baroness Marie Vetsera; and the "disappearance of the Emperor's only brother, Archduke Johann, who sailed as Captain John Orth from Buenos Ayres, in 1890, and has never been heard of since."

Empress Elizabeth was born December 24, 1837, and was the second daughter of Duke Maximilian Joseph, who was the head of the Birkenfeld-Zweibrücken branch of the Wittelsbach family. After the French revolution this branch, which had previously maintained an independent sovereignty over a small German state, lost its power and the state was incorporated with the Kingdom of Bavaria. The deposed family, however, was permitted to retain its royal rank, its members being entitled "Dukes and Duchesses in Bavaria." The fact that Duke Maximilian had few of the cares of state allowed him to give more time to his children, who were thoroughly and practically educated. "The Empress's eldest brother is Duke Karl Theodor, who, after studying as a physician and an oculist, has established a private hospital on the Tegernsee, and has the reputation of being one of the best oculists living. . . . One sister was the plucky ex-Queen of Naples, who tried to make a man of the imbecile Francis II; another was the Duchesse d'Alençon, who perished in the Bazar de Charité fire in the Rue Jean Goujon at Paris last year (1897), and who, when a girl, refused to become Queen of Bavaria by marrying Ludwig II."

The Empress, who was a most beautiful woman, was married in April 1854, to Franz Josef. Four children were born to them, of whom "two daughters are now living, the Archduchess Gisela, married to Prince Leopold, second son of the Prince-Regent of Bavaria, and the Archduchess Valerie, married to Archduke Franz Salvador of the Tuscany branch of the Hapsburgs." The love of outdoor life which the Empress acquired in childhood never left her and she had a strong dislike for conventionality and court functions. She was a daring horsewoman and fond of sports; much of her time was passed away from Vienna, either on her country estates, in traveling or in extended visits to other countries, particularly England and Ireland. She never publicly manifested any interest in politics, and therefore never incurred the dislike of statesmen, but her aversion to social life made her unpopular at court; in fact, she was never liked in Vienna, though she was always respected, for no word of scandal was ever spoken against her. She was fond of traveling incognito and practically unattended, and it was on account of this fact that her assassination was made possible. Of her intellectual attainments it has been said:

"The Empress Elizabeth was an educated woman and a generous patron of literature and art. Her favorite poet was Heine; she had a monument to him erected on the grounds of her Achilleion when one German town after another was refusing to do him that honor. Besides speaking well the languages of civilized Europe, she was said to be able to speak all the tongues found in the babel of the Austro-Hungarian monarchy, and when well past middle life, thinking to live on a Greek island, she took up the study of Greek and learned to speak it."

Upon the death of the Empress, letters of condolence and sympathy came to Franz Josef from the rulers and officials of all the leading nations of the world. The assassination caused the plans for the celebration of the fiftieth anniversary of Franz Josef's accession to the throne to be postponed. See AUSTRIA-HUNGARY (paragraphs on History).

ELKS, BENEVOLENT AND PROTECTIVE ORDER OF, a fraternal society founded in 1868, has 1 grand lodge, 450 sub-lodges, and 50,000 members in the United States. Since 1868 it has disbursed \$700,000 and \$46,774 in its last fiscal year. John Galvin, Cincinnati, is the Grand Exalted Ruler; G. A. Reynolds, Saginaw, Mich., secretary; and E. S. Orris, Meadville, Pa., treasurer.

ENGLAND, CHURCH OF, "established" as the national church with the Sovereign as its supreme governor, now has two archbishops, 33 diocesan bishops (24 of whom have seats in the House of Lords), and 17 bishops suffragan; there are about 14,000 parishes, about 23,000 clergymen, 90 archdeacons, and 810 rural deans. Each diocesan bishop has a court with legal officials. The Convocations or provincial synods of Canterbury and York are the deliberative bodies of the provinces of Canterbury and York, respectively.

Church Officers.—Archbishop and Primate of All England, Rt. Hon. and Most Rev. Frederick Temple, D. D., Lambeth Palace; Archbishop and Primate of England, Rt. Hon. and Most Rev. William Dalrymple Maclagan, D. D. The bishops are: London, Rt. Hon. and Rt. Rev. Mandell Creighton, D. D.; Westminster, Very Rev. George Granville Bradley, D. D.; Durham, Rt. Rev. Brooks Foss Westcott, D. D.; Winchester, Rt. Rev. Randall T. Davidson, D. D.; Bangor, Rt. Rev. Daniel L. Lloyd, D. D.; Bath and Wells, Rt. Rev. George Wyndham Kennion, D. D.; Bristol, Rt. Rev. George Forrest Brown, D. D.; Carlisle, Rt. Rev. J. Walling Bardsley, D. D.; Chester, Rt. Rev. Francis J. Jayne, D. D.; Chichester, Rt. Rev. Ernest B. Wilberforce, D. D.; Ely, Rt. Rev. Lord Alwyne Compton, D. D.; Exeter, Rt. Rev. Edward H. Bickersteth, D. D.; Gloucester, Rt. Rev. Charles J. Elliott, D. D.; Hereford, Rt. Rev. John Percival, D. D.; Lichfield, Rt. Rev. and Hon. Augustus Legge, D. D.; Lincoln, Rt. Rev. Edward King, D. D.; Liverpool, Rt. Rev. John Charles Ryle, D. D.; Llandaff, Rt. Rev. Richard Lewis, D. D.; Manchester, Rt. Rev. James Moorhouse, D. D.; Newcastle, Rt. Rev. Edgar Jacob, D. D.; Norwich, Rt. Rev. John Sheepshanks, D. D.; Oxford, Rt. Rev. William Stubbs, D. D.; Windsor, Rt. Rev. Philip F. Eliot, D. D.; Peterborough, Rt. Rev. Hon. Edward C. Glyn, D. D.; Ripon, Rt. Rev. William B. Carpenter, D. D.; Rochester, Rt. Rev. Edward S. Talbot, D. D.; St. Albans, Rt. Rev. John Wogan Festing, D. D.; St. Asaph, Rt. Rev. Alfred G. Edwards, D. D.; St. Davids, Rt. Rev. John Owen, D. D.; Salisbury, Rt. Rev. John Wordsworth, D. D.; Sodor and Man, Rt. Rev. Norman D. J. Straton, D. D.; Southwell, Rt. Rev. George Ridding, D. D.; Truro, Rt. Rev. John Gott, D. D.; Wakefield, Rt. Rev. George Rodney Eden, D. D.; and Worcester, Rt. Rev. John James Stewart Perowne, D. D. There are 90 colonial and missionary bishops.

Ritualistic Controversy.—A good deal of excitement was caused in 1898 by the opposition within the Church of England to the practices of the so-called Ritualists and sharp discussion arose early in the year from the action of a certain Mr. Kensit, who addressed a letter to the Bishop of London, complaining of the way in which the services were conducted in his parish church, and especially of the fact that at the high celebration only the priest communicated. In reply the bishop advised Mr. Kensit to attend some church at which the services pleased him better, but at the same time implied that there was no reason why he should be excluded from the communion. It was Mr. Kensit's purpose, however, to protest against the extent to which ritualistic practices had been introduced in the churches, and with this end in view he visited a number of churches attended by followers. These visits, in several instances, resulted in disturbances, and on one occasion, when he and his followers protested against certain services as idolatrous, the affair led to Mr. Kensit's conviction by a magistrate, but the sentence was quashed on appeal. In May a petition, sent by Mr. Kensit to the Bishop of London on the subject of church ritual, led to a discussion of the whole matter in the House of Lords. Later in the month a conference of the clergy, including many of the high church party, passed resolutions declaring the authority of the bishop to enforce the use of services contained in the Book of Common Prayer, and to prohibit any that were not therein. Another influential assemblage of clergymen passed resolutions to the same effect and pledged its members to the use of the services contained in the Book of Common Prayer. There followed several addresses on the part of the bishops to their dioceses on the subject of church ritual. Some of these drew attention to innovations in ritual and doctrine, and demanded that certain practices should be given up. Others urged a spirit of forbearance on both sides with a view to putting an end to what was regarded as an unseemly contest. The Bishop of London declared the services prescribed in the Book of Common Prayer ought not to be altered or replaced by others, that the communion service should be practised exactly as it was set down in that book and that any additional services should first receive the sanction of the bishop. When the Benefices Bill came up in Parliament the ritualistic question was discussed in both houses. Sir William Vernon Harcourt caused much excitement by his at-

tacks on the high church party. He said that the bishops had no authority to permit the use of additional services containing anything that did not form a part of the Bible or of the Book of Common Prayer, with the exception of anthems or hymns. (See GREAT BRITAIN, paragraphs on History.) In a series of letters to the *Times* he defined this position at length. Another blow was struck at the high church party when the Church Association published a strongly worded manifesto against ritualism. The "Gideonites," as the followers of Mr. Kensit were called, occasioned some further disturbances. Many columns of the press were filled with discussion of the matter, especially on the subject of confession. As to the duty of the church toward practices which were said to be uncanonical, the Archbishop of Canterbury, who began his visitation on October 10, made some interesting statements. The Church of England, said he, had given no answer to the question of the real presence and had not forbidden any one to hold or preach the doctrine. It had forbidden the worship of saints and the partial worship of relics, pictures, etc. Prayers for the dead were nowhere forbidden. As to confession, he said that compulsory confession was not admitted. He said that no change in the ceremonial prescribed by the Book of Common Prayer was allowable, except with the approval of the lawful authority, but that additional services, agreeing in substance with the Bible and the Prayer Book were admissible, even though their precise words were not found in either book. The observance of the rubric and obedience to the bishops were enjoined. On October 29 Lord Salisbury declared his sympathy with the opposition to ritualistic practices, saying that no one ought to remain in the church who would not stand by the Book of Common Prayer.

Disestablishment is a policy favored by a considerable body of persons in Great Britain, who advocate the placing of the state churches on the same footing as the other religious organizations. The Church of England is established in England and Wales, and the Presbyterian Church in Scotland. Disestablishment and disendowment have been features of the Liberal programme for many years, and in 1894 a bill for disestablishing the Church of England in Wales was brought in under the Rosebery government, but defeated in the following year by a majority of 44. Disestablishment does not mean that the life interests of the clergy are to be disregarded or that the buildings and endowments, which the churches have derived from the generosity of their worshippers are to be taken away. It was provided in the bill for the disestablishment of the Church of England in Wales that the bishops and clergy should retain during their lifetime their incomes, palaces and parsonages and that the church should retain its buildings and all the wealth it had derived from private beneficiaries for the preceding 233 years, that is since 1662. It was opposed in England as well as in Wales by the friends of the established church. In 1895 a bill for the disestablishment of the Church of Scotland was brought in, but not discussed. The disestablishment movement has been actively furthered in recent years by the so called "Liberation Society," founded for the purpose of freeing religion from state patronage and control. This society did much to bring about the disestablishment of the Irish Church, the opening of the national universities to non-conformists and other measures looking to religious equality. In 1898 it started an active campaign for the purpose of introducing the disestablishment issue into the next general election. The ritualistic controversy, which has just been described, gave it an opportunity to say on October 24, 1898, that it regarded "with concern and apprehension the lawlessness, antagonism and confusion now existing in the established church as the result of the growth of sacerdotalism among its clergy, as well as of other causes," and that it believed the interests of religion to be seriously imperilled. It, therefore, urged, as the only remedy for those evils, the policy of disestablishment.

ENO, AMOS R., a New York real estate speculator, died February 21, 1898. He was born in Simsbury, Connecticut, November 1, 1810; entered the wholesale dry goods business in New York in 1833, from active participation in which he retired in 1857 and gave his attention to ventures in real estate. He was eminently successful and accumulated an immense fortune. Mr. Eno was recognized as a man of integrity and excellent judgment; he was benevolent and always maintained an interest in intellectual pursuits. He will be especially remembered for preventing, at a cost of between \$3,000,000 and \$4,000,000, the failure of the Second National Bank, New York, in 1884, of which his son, John C. Eno, was president. His estate was valued at from \$20,000,000 to \$40,000,000, the greater part of which was left to members of his family. Large amounts were left to many charitable institutions; among other bequests was one of \$150,000, the income of which was to be devoted to indigent members of the Chamber of Commerce, and another of \$50,000 to Amherst College.

EPIDEMIC INFLUENZA (LA GRIPPE). The annual visitation of this disease in 1898 has been of unusual severity, and it has invaded territory formerly exempt from its ravages. The contagiousness of influenza is now a settled fact. It is also true that healthy people are more apt to be attacked than those in previously feeble health. Relapses occurred in ten per cent. of the cases. The aërobe causing influenza is called Pfeiffer's bacillus. It was discovered in 1891 by Pfeiffer, Kitasato and Canon, working independently. It is a bacillus occurring singly or in clumps, appearing as a straight rod with rounded ends, non-motile, and not forming spores. It is best stained by a weak solution of carbol-fuchsin applied for at least ten minutes. The bacilli are found chiefly in the respiratory passages, mixed with other organisms in the nasal mucus or in the sputum from the bronchi, and even penetrating the superficial parts of the mucous membrane. It is occasionally found in the blood in small numbers. It is found in the secretion in middle ear inflammation and also in cases of meningitis. The chief symptoms of the disease are due to toxines resident in the bodies of the bacilli and absorbed from the respiratory tract. Experimental inoculation of monkeys has caused high fever followed often by death, no definite results being reached. But there is no evidence that any of the lower animals suffer from influenza in natural conditions. The bacillus has not been found in any other disease but is always present in the secretions of the respiratory tract in true influenza. The symptoms of a typical attack of influenza are headache, with especially severe pain in the orbits and at the base of the occiput; fever, with a temperature of 102° or 103°, generally following an initial chill; great prostration and weakness with mental depression; pain in many of the joints and the bones and tenderness in the muscles; swelling of the mucous lining of the nasal passages with increased flow of mucus; cough, with expectoration of small masses of thick, yellowish and greenish mucus, accompanied by tenderness in the region of the breast bone; rapid and generally weak pulse; buzzing noises in the ears and slight tremor of the whole body. There is an inflammation of the throat, its mucous lining being congested and the palatal folds swollen and rigid. In some cases there is an eruption on the body. In some there is no cough and no bronchial implication. In all there is a danger of pneumonia (see **PNEUMONIA, LOBULAR**), and the patient should be kept in bed, under a physician's care, as long as there is any rise of temperature. Contagion is carried by the sputa and the mucus of the nostrils, and precautionary measures should include sterilization of these discharges with hot water, cleansing the mouth and nostrils, and prevention of the deposition of these secretions upon carpets or furniture. Bed linen should be put into boiling water. The bacilli of influenza die in two days after expulsion from the body.

Authentic epidemics of influenza have occurred frequently since 1173. Its first appearance in this country was in 1789. The pandemic in which the present generation is most interested began in 1889, when the disease overflowed the whole globe. Since that date the country has hardly been free from the disease, for the epidemic of 1893-4 must be viewed as a recrudescence of the former epidemic. Individual cases or small endemics have been separately observed. During December 1898, influenza has been the cause of an unusually large number of deaths. The pandemic of 1889 originated in Central Asia. From Bokhara it was traced successively to Siberia, European Russia, Sweden, Denmark, France, Germany, Belgium and England; Asia Minor, Italy, Turkey and Greece being attacked simultaneously with Germany and England. Shortly thereafter it appeared in Tunis, later in Mexico, South America and Australia. It invaded Boston at the time London was attacked, and San Francisco contemporaneously with Buenos Ayres. It appears to invade trading centres and railroad towns much earlier than sparsely settled districts in the same locality. Human intercourse and especially commerce appear to be the determining factors in its dissemination. See **PUBLIC HEALTH**.

EPILEPTICS, COLONIES FOR. Great advance has been made in the care of epileptics during 1898. The second year of the epileptic colony of New York State, at Sonyea was completed February 1. New Jersey set apart, in September, a tract of 187 acres, the "Maplewood Farm," on the Sourland mountain, near Skillman, for the establishment of an epileptic colony. An adjoining farm of 213 acres is to be acquired also, thus furnishing ample room, when buildings shall have been erected, for over 1,000 patients now confined in jails, or hospitals, or insane asylums throughout the State. The Pennsylvania Epileptic Hospital and Colony Farm, at Oakbourne, was opened May 19. In California detached buildings were erected during the year upon the grounds of the California Home for Feeble-minded, in Sonoma county, for the accommodation of epileptics dependent upon the State. Massachusetts and Ohio have also taken measures to provide separate and special buildings for the care of this unfortunate class. Dr. Frederick Peterson, of New York, president of the Craig

Colony for Epileptics in New York State, from whom we quote many of the succeeding statements, is authority for the claim that there are over 12,000 epileptics in the State of New York alone, some 400 being in insane asylums, and about 600 in county poorhouses. One person being thus afflicted in 500, there are about 130,000 such unfortunates in the United States. The first Colony for Epileptics was the Bethel Epileptic Colony, established by Pastor von Bodelschwingh over 25 years ago, at Bielefeld, near Hanover, Germany. Starting with 4 epileptics, there are now 1,400 in the enlarged and prosperous colony. Several other colonies have been established in Germany, one in Zurich, Switzerland, one in Holland and one in England. A similar institution to Bethel was founded by a clergyman, John Bost, over 40 years ago, in La Force, near Lyons, France. The Craig Colony of New York, the most nearly complete and most extensive in this country, was informally opened for patients February 1, 1896, starting with 1,900 acres of well-cultivated fields, fine orchards and productive market gardens, with about 30 buildings thereon; residences, barns and shops, the latter used in broom-making, canning fruits and vegetables, etc. On the grounds are building-stone quarries, brick clay deposits, and acres of standing timber. A saw-mill and a flouring mill stand ready on a rapid stream, which divides the tract of land into halves. The property formerly constituted the site of a thrifty Shaker settlement. It is the largest in use for this purpose in the world, and is considered ideal in situation and facilities. As such it merits extended reference. The report of Craig Colony for the year ending September 30, 1898, states the census at that date as follows: 165 men, 177 women; total, 342. Sixty-one men and 96 women were admitted during the previous fiscal year, and the discharges and deaths number 61 men and 13 women during the same period. Preference in admission was given to those offering hope of recovery and those who would not be an absolute burden to the colony at the outset of its career. The total deaths during the year were 14, or 3.8 per cent. The per capita, annual cost over the value of articles produced, was \$174.10. During the month of August patients were employed as follows:

Daily average number of men, 150; daily average number employed, 129; daily average number at profitable labor, 99; per cent. employed of total number, 86; daily average value of all male labor, \$46.90.

Daily average number of women, 145; daily average number employed, 122; daily average number at profitable labor, 75; per cent. employed of total number, 83; daily average value of all female labor, \$25.65.

An athletic field has been built, where the patients engage in bicycling, tennis, baseball and track sports. There is a military company of 36 boys and young men, which has regular drills. A band of seventeen pieces has been organized, and has given concerts from time to time.

The average daily attendance in the school has been 25. Instruction is given in reading, writing, letter-writing, language, arithmetic, drawing, kindergarten work, clay modeling and basket weaving. There is also a class in manual training. Ninety per cent. of 275 cases had seizures on an average of one, or more, every seven days. Only 27 had attacks less than a week apart. Seven patients were discharged as recovered during the year. All of these had been kept at the Colony two years after the last seizure, and all will be held under observation hereafter.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

EPWORTH LEAGUE, organized in 1889, by five societies of the M. E. Church, consisting of about 1,500 local societies, or chapters, and 6,000 members. In 1898 the number had increased to 25,554 chapters and 1,800,000 members. The object is to promote piety among the young members of the church. It has prayer meetings, "intellectual" and "mercy and help" departments. The weekly organ is called *The Epworth Herald*. The headquarters are 57 Washington St., Chicago, Ill. Officers for 1899 are: President, Bishop William X. Nide, Detroit; vice-presidents, W. I. Haven, Brookline, Mass., department of mercy and help, Rev. E. M. Mills, Elmira, department of mercy and help, R. R. Doherty, New York, department of literary work, and J. A. Patten, Chattanooga, department of social work; treasurer, C. E. Piper, Chicago; and secretary Edwin A. Schell, Chicago.

EPWORTH LEAGUE OF THE M. E. CHURCH, SOUTH, organized in Memphis in 1891, has the same aims as the foregoing society. Its organ is the *Epworth Era* published in Nashville, Tenn., the headquarters of this league. It numbers 6,533 chapters; and 400,000 members. Officers for 1899: President, Bishop W. A. Chandler, Oxford, Ga.; vice-presidents, J. W. Newman, Birmingham, Ala., W. T. McClure, Independence, Mo., and J. M. Barcus, Temple, Texas; treasurer, O. W. Patton, Nashville; and secretary, H. M. DuBose.

ERITREA, or ERYTHREA, is the name of the possessions of Italy in Africa on the western coast of the Red Sea from Cape Kasar on the north to the French dependency Obok on the Strait of Bab-el-Mandeb, having a coast line of 670 miles, an area of

about 88,500 square miles, and a population estimated at 450,000, of whom in 1893 3,452 Europeans were enumerated. The area, however, has been diminished by the paring down of the Italian territory as the result of negotiations with Abyssinia. It is placed by some at 52,000 square miles. These possessions were constituted as a colony by various decrees from 1890 to 1894. The principal town and seat of government is Massowah on the Red Sea, with a population of 7,775, including about 600 Europeans, not counting the garrison. The Italian government has spent large sums of money on this colony especially on the military account, and thus far it has not paid for itself. The budget for 1897-98 was estimated at 19,800,000 lire, of which 17,900,000 lire were contributed by the home government. Agriculture is still in a primitive stage and its development is checked by the lack of water during the summer season. There is good pasturage, and camels, oxen, goats and sheep are raised. The local trade includes among other articles, meat, hides and butter. The pearl-fishing industry at Massowah and the Dahlak Archipelago is important. Massowah is connected with Saate by a military railway 17 miles in length and by short lines, aggregating about 16 miles, with other points. It is also connected by telegraph line with Assab, which in turn is connected with Perim, making an aggregate of about 380 miles of telegraph. The coins in circulation are mainly Maria Theresa dollars, but the legal currency consists of the Italian coins and those of the Latin Union.

It is administered by a civil governor nominated by the King of Italy and is under the general direction of the Minister of Foreign Affairs, but the Governor being a military officer in active service is in this capacity under the control of the War Office. In 1898 the Governor was Ferdinando Martini, who had set out for the colony at the close of December 1897. Italy gained possession of Massowah, which formerly belonged to Egypt, in 1886. By the treaty of Uchali in 1889 and the supplementary agreement of 1891, Italy secured from King Menelek of Abyssinia Hamesen and the northern districts together with the coast. In 1895 Kassala, which had been captured from the Dervishes by the Italians in the previous year, was occupied in accordance with an agreement with Great Britain that Italy might hold it in trust till the Egyptians were able to regain control. In 1897 the ability of the Egyptian government to do this became evident and in December of that year the Italian commandant evacuated the town. In the meanwhile the Italian army had met with a crushing defeat near Adowa, March 1, 1896, the result of which was the treaty of Adis Abeba on October 6, 1896, restoring to Abyssinia a large part of what had been obtained by Italy and recognizing the complete independence of Menelek's kingdom. The points left unsettled in this treaty were required to be adjusted within a year from its conclusion. In 1897 the Italian government announced its intention of turning Eritrea from a military into a civil and commercial colony, and of reducing the limits of the territory occupied by the military. Till the autumn of 1897 the Italian envoy, Major Nerazzini, was engaged in a fruitless attempt to negotiate a mutually satisfactory boundary line between the Italian territory and that of Abyssinia. At last a line was fixed upon which shut out Italy from two important provinces that she had claimed and gave her a boundary far inferior for purposes of defense. This was accepted by the Italian government, but later when the ministry proposed to limit the military occupation to Massowah, King Menelek was encouraged to reject this boundary and demand further concessions. A commercial treaty, however, was negotiated by the Italian envoy and in this Italy secured the right of sending a representative to the Abyssinian court and full freedom of trade and travel for her citizens in Abyssinia. Both countries bound themselves to promote in all possible ways the facilities for commercial relations between Abyssinia and the Italian possessions. Italy also secured protection for her merchants and the application to herself of the most-favored-nation clause.

ESSEX INSTITUTE. See ANTHROPOLOGY.

ESTERHAZY, COUNT MARIE CHARLES FERDINAND WALSIN, who was said to have been the real author of the famous *bordereau*, in the Dreyfus case (see FRANCE, paragraphs on History), was a major in the French army. It was not till the autumn of 1897 that his connection with the Dreyfus affair came to light. On Nov. 15, 1897, Mathieu Dreyfus, the brother of the condemned officer, wrote to the Minister of War, Gen. Billot, charging Esterhazy with being the author of the *bordereau*. The court-martial of Esterhazy, which began on Jan. 10, 1898, is discussed in the history of the Dreyfus affair in the article FRANCE. The session was held in secret as soon as it appeared that secrets involving the national defense would be disclosed. The evidence against Esterhazy was procured by Lieutenant-Colonel Picquart, who had observed the identity of Esterhazy's hand-writing with that of the *bordereau*, and had brought the matter to the attention of his chiefs. Esterhazy, upon examination, made a general denial and tried to give the impression that the charges against him were due to plots of the friends of Dreyfus. It was decided that no judicial proof of guilt

had been established, and the verdict of not guilty was received with great enthusiasm by the crowd outside the court room. Major Esterhazy was summoned as a witness in the trial of M. Zola, but turned his back on the counsel for the defense, and during an entire hour remained silent, while M. Clemenceau read a long list of questions bringing out the discreditable acts of his past life. In the spring of 1898, however, strong evidence appeared in proof of Major Esterhazy's guilt. A letter was published by a diplomatist living in Switzerland, revealing the relations between Major Esterhazy and the German military attaché at Paris. It was said that Major Esterhazy was in constant communication with that officer, and that upon the arrest of Dreyfus, the attaché was in great anxiety until he found out that the prisoner was not Esterhazy. The German attaché, it was said, had proof of the unjust conviction of Dreyfus, and had confided his views to the Italian military attaché, to whom he said that Esterhazy had threatened his life if he would not go to the Dreyfus family and say that he had positive proof of the guilt of Dreyfus. On Sept. 9, soon after the death of Colonel Henry, Esterhazy disappeared from France, but soon afterwards it was reported that he was staying in London, where it was said that he admitted to several persons that he wrote the *Dreyfus bordereau*. He is also said to have declared that he had tried in vain to convince General Pellieux that the Henry document was a forgery and that he intended to publish a book which would throw much information on the Dreyfus affair. Extracts from this book were published by a French newspaper in November in which the author reasserts that he was the tool of the General Staff and that he left France to escape being assassinated or being driven to suicide like Lieutenant-Colonel Henry.

ETHERION. Few facts have been established regarding etherion, lately discovered by Charles F. Brush, an American scientist and electrician. It is believed to be far lighter than hydrogen, with a much greater heat conductivity. It probably extends indefinitely into space, and its molecules have a very rapid rate of vibration.

ETHNOLOGY. See ANTHROPOLOGY.

ETRUSCAN CIVILIZATION, CHRONOLOGY. See ARCHÆOLOGY (paragraph Italy).

EUROPE, FLORA OF. See BOTANY (paragraphs Systematic Botany, Europe, Ecology and Plant Geography).

EVANGELICAL ASSOCIATION, sometimes incorrectly called the German Methodist Church, had a successful year. It reports 1,787 churches, 1,053 ministers, and 116,714 members, showing an increase of the latter of nearly 22,000 since 1897. There were 2,269 Sunday schools, with 145,413 scholars, and the Young Peoples' Alliance numbered 34,649 members. Altogether \$934,742 were contributed. The General Conference, which meets quadrennially, will be held in October 1899, at St. Paul, Minn. The German and United Evangelical associations have, according to the last report of the commissioner of education, 3 institutions of higher education with 16 officers of instruction, 159 students, and endowment funds of \$4,475.

EVANS, ROBLEY D., Captain, U. S. N., was born in Virginia in 1846. He served in the Civil War; was finally promoted to a captaincy in the navy, June 27, 1893; on July 19, 1894, he took command of the armored cruiser *New York*, and of the battleship *Indiana* on the 23d of the following August. Subsequently he was given lighthouse duty, but in March 1898, at his own request, he was detached from this and was placed in command of the battleship *Iowa*. He held this command during the Spanish-American War and in the naval fight off Santiago, July 3, 1898. See SPANISH-AMERICAN WAR.

FABIAN SOCIETY. A society with socialistic aims, founded in England in 1883. Local branches have been established in the towns of the United Kingdom and in the United States, but since the formation of the Independent Labor Party (see SOCIALISM, paragraph Great Britain) many of its members have become merged in the latter. The membership of the society in 1898 was placed at 835. It carries on an active propagandism and its members deliver gratuitous lectures in all parts of the country. It preaches the necessity of taking the ownership of land and of industrial capital from the individual and vesting it in the community for the general benefit.

FABRE, FERDINAND, French poet and novelist, was born at Bédarieux, Hérault, France, in 1830, and died February 11, 1898. His first publication, *Feuilles de Lierre*,

appeared in 1853; so much penetrating analysis is displayed in his *Scènes de la Vie Cléricale* that Sainte-Beuve honored Fabre by calling him "a brave disciple of Balzac." It is said that the life and manners of the French clergy perhaps have not been better portrayed by any other writer. Among his other well known works are *Les Courbezou, Julien Savignac, L'Abbé Tigrane, Chevrier, Mon Oncle Célestin, L'Abbé Roitelet, and Un Illuminé.*

FAIRBANK, CALVIN, died at Angelica, New York, October 12, 1898. He was born at Pike, New York, in 1816, and at an early age entered actively into the abolition movement. He rendered assistance to many slaves in escaping to the free States and frequently violated the Fugitive Slave Law after the passage of that act. On account of his zeal against slavery he was arrested in Kentucky, and in September 1844, was sentenced to fifteen years' imprisonment at Frankfort. He was pardoned, however, in August 1849. In November 1851, he was again arrested, at Jeffersonville, Indiana, was taken to Kentucky, and again sentenced to fifteen years' imprisonment at Frankfort. He was pardoned in June 1864. During these imprisonments he was cruelly maltreated, and his health was impaired by the unsanitary condition of his prison and the more than one thousand floggings that he had received. Mr. Fairbank was a friend of many prominent abolitionists. He was the author of *How the Way was Prepared.*

FAIRBANKS, CHARLES WARREN, Republican Federal Senator from Indiana, was born May 11, 1852, near Unionville Center, Union county, Ohio; in 1872 was graduated in the classical course at Ohio Wesleyan University, Delaware, Ohio; studied law and was admitted to the bar. In 1874 he removed to Indianapolis. Mr. Fairbanks was a delegate at large to the St. Louis Republican national convention (1896), of which he was temporary chairman. He never held any public office until he took his seat in the United States Senate, March 4, 1897, having been elected January 20, preceding, by a majority of 21 on joint ballot, over Daniel W. Voorhees and Leroy Templeton. He was chairman of the American delegation of the Anglo-American Joint High Commission which was created in May 1898. For an account of this commission, see CANADA.

FALKLAND ISLANDS, a crown colony of Great Britain, consisting of about 100 small islands situated 300 miles east of the strait of Magellan. The total area is 6,500 square miles, of which East Falkland contains 3,000 and West Falkland 2,300. The population in 1891 was 1,789—1,086 males, 703 females; of this number 123 were foreigners; the population in 1896 was 1,992. There is a legislative council, an executive council, and a governor, the incumbent in 1898 being William Grey-Wilson (appointed Mar. 1897). The only military force is a small volunteer corps. The principal town and seat of government is Stanley, having a population of 694. In 1896 there were two government schools, one Roman Catholic, one Baptist, and the Darwin school, having a total of 253 pupils. The most important industry is sheep-raising, there being 761,768 sheep and 2,325,154 acres of pasturage. Statistics of finance:

	1894.	1895.	1896.
Revenue	£11,958	£12,518	£12,358
Expenditure	12,395	13,159	13,569
Imports	62,270	71,826	69,985
Exports	131,801	122,988	132,194

In 1896 the chief sources of revenue were: rents of crown lands, £4,916, and customs, £2,804; chief expenditures: official salaries, £5,693, mails, £3,000, and public works, £2,151. The more important exports are: wool, frozen mutton, hides, skins, and tallow; imports: provisions, clothing, machinery and tools, timber and building materials. Of the exports (1896) £131,186 went to Great Britain and £1,008 to other countries; of the imports (1896) £62,641 came from Great Britain and £7,344 from other countries. South Georgia, a barren and uninhabited island 1,000 miles E. S. E., has been annexed to the colony.

FARM ANIMALS. The following table published by the Department of Agriculture shows the number of farm animals in the United States by States and Territories on January 1, 1899.

FAUCIT, HELEN (Lady Theodore Martin), a celebrated English actress, died at her home, Bryntyrilio, near Llangollen, Wales, October 31, 1898. She was born in England in 1820 and was the daughter of an actress of considerable ability. She made her debut at Covent Garden, London, January 5, 1836, as "Julia" in *The Hunchback*. She was eminently successful and soon was recognized as an actress of the highest rank. Miss Faucit was the first to interpret the character of the heroines in a number of well known dramas, including *Richeieu* and *The Lady of Lyons*. Her fame rests not only on these successes but on her superb rendering of Shakespearean rôles, among which were "Constance," "Juliet," "Imogen," "Beatrice," "Hermione," "Portia," "Cordelia," "Desdemona," "Rosalind," and "Lady Macbeth." She achieved a great success in *King Ren's Daughter*, an adaptation from the Danish of Henrik Herz by Mr. Theodore Martin. This writer, who is well known as a metrical translator of modern and classical poets, she married in 1851. After this time her public appearances were infrequent, the last ones being as "Beatrice" at Stratford-on-Avon at the opening of the Memorial Theatre, April 1879, and as "Rosalind" at Manchester in October of the same year. The latter appearance was for the benefit of the widow of Charles Calvert. She published a successful work, *On Some of the Female Characters of Shakespeare*. Her husband was knighted in 1880.

FAULKNER, CHARLES JAMES, Democratic United States Senator from West Virginia, on September 19, 1898, succeeded Senator George Gray, of Delaware, as a member of the Anglo-American Joint High Commission, which was created in May 1898. Senator Gray resigned the position to become a member of the commission appointed to negotiate the treaty of peace with Spain. Senator Faulkner was born in Martinsburg, West Virginia, September 21, 1847. His father, C. F. Faulkner, represented both Virginia and West Virginia in Congress and was appointed by President Buchanan minister to France. Young Faulkner accompanied him in 1859, and attended noted schools in Paris and Switzerland. Upon the outbreak of the Civil War he returned, and entered the Virginia Military Institute at Lexington. On

May 15, 1864, he served with the cadets in the battle of Newmarket; soon after he became aid to the Confederate General J. C. Breckenridge, and subsequently to Gen. Henry A. Wise, with whom he surrendered at Appomattox. Faulkner was tutored by his father until October 1866, when he entered the University of Virginia, being graduated in June 1868, and in September of that year he was admitted to the bar. In October 1880, he was elected judge of the thirteenth judicial circuit (Jefferson, Morgan and Berkeley counties); succeeded Johnson N. Camden in the Federal Senate, March 4, 1887, and was re-elected in 1893. He is a member of several important Senate committees, including appropriations, immigration, and the judiciary. In 1888 he was permanent chairman of the Democratic State convention of West Virginia, and in 1892 both temporary and permanent chairman. In 1894 and 1896 he was chairman of the Democratic Congressional campaign committee. For an account of the Joint High Commission above mentioned, see CANADA.

FAURE, FRANCOIS FELIX, sixth president of the third French Republic, was born in Paris, January 30, 1841. His father, who was a cabinet maker, succeeded in educating him for a business career. When ten years old young Faure entered the Institution Bousquet at Chaillot and afterward passed two years in England. Returning to France he served for three years as a tanner's apprentice at Amboise and then was engaged by a large leather firm at Havre, where he soon established a business for himself which became well known. At the breaking out of the Franco-Prussian War (1870) he was a ship-owner and president of the Chamber of Commerce at Havre. He served in the war as a captain in the Garde Mobile, and for bravery was rewarded with the cross of the Legion of Honor. He entered public life in 1881 as a member of the Chamber of Deputies from Havre; was Under-Secretary of State for Commerce in Gambetta's cabinet (1881), held the same position in Ferry's cabinet (1883), and in 1888 was Under-Secretary for the Colonies in the cabinet of M. Tizard. In 1894 he became Minister of Marine and on January 17 of the following year was elected President, as a moderate Republican, by 430 votes against 361 for M. Henri Brisson, to succeed M. Jean Paul Casimir-Périer, resigned. He has been recognized as an astute politician, but not a great statesman. In 1895 underhand attacks were made on his social standing, and in December of that year he issued a statement in which he said that in 1841 his father-in-law had been found guilty of malversation and that he had married the daughter with full knowledge of the facts of the case. He also stated that at the time of his election to the presidency he had apprised the foreign ambassadors of these facts and that no power had protested. This action met with general approval. In 1879 he was chosen to arbitrate the boundary dispute between Colombia and Costa Rica.

FEBIGER, JOHN CARSON, Rear-Admiral, U. S. N., retired, died at Londonderry, Maryland, October 9, 1898. He was the grandson of Christian Febiger, the Revolutionary officer, and was born at Pittsburg, Pennsylvania, September 14, 1821; entered the navy from Ohio as a midshipman in September 1838, and served in South American and African waters. He was promoted passed midshipman in 1844, lieutenant in 1853, and received his commission as commander in August 1862, being assigned to the steamer *Kanawha*, of the West Gulf blockading squadron. After having various commands he was assigned to the North Atlantic squadron in 1864, and on May 5 of that year took part in defeating the Confederate ram *Albemarle* in Albemarle Sound, North Carolina. For gallantry and skill in the engagement he was commended by Rear-Admiral Samuel P. Lee. He became captain in 1868 and commodore in 1874. He was inspector of naval reserve lands, 1869-72, was a member of the board of examiners, 1874-76, and for the next four years was in command of the navy-yard at Washington. In February 1882 he was made a rear-admiral and on July 1, of that year was retired at his own request.

FEDERATION OF LABOR, AMERICAN, organized in 1886, is composed of 67 national unions, 10 state branches, 79 city central unions, and 359 local unions, with a total membership of 625,000. About 270 weekly and monthly papers are published, but the *American Federationist* is the official organ. It aims to regulate all industrial employment, the wages of laborers, and the formation of public opinion, through the press, platform, and legislation. President, Samuel Gompers, New York; secretary, Frank Morrison, Washington, D. C.

PEEBLE-MINDED, EDUCATION OF THE. See EDUCATION.

FELDSPAR. The production for 1897 (figures for this year being the latest obtainable) amounted to approximately 21,000 tons valued at \$113,773. Nearly the entire output is consumed by pottery manufacturers for use either as a flux in pottery or for glazes. The important producing States were Maine, Connecticut, Pennsylvania, and New York. Feldspar deposits of commercial value have recently been described as occurring in the serpentine rocks of southeastern Pennsylvania, especially in Chester Co. Some of the veins are 25 to 30 feet thick and have been explored to a depth of 60 feet.

FERGHANA. See **RUSSIA** (paragraphs on History).

FERMENTATION. It has been fairly conclusively shown that alcoholic fermentation can take place without the presence of yeast cells. The yeast contains a chemical body (first brought out by Buchner) that is capable of causing fermentation.

FERMENTS. F. C. Newcomb has isolated a new ferment or enzyme, which is capable of digesting cellulose. He has obtained it from the seeds of the date and from a lupine, *lupinus albus*, and also from a mould, *aspergillus oryzae*. It is not the same as diastase, the widely distributed form of vegetable ferment, although it has some of the same properties on starch and other substances. The aspergillus ferment acts most energetically on cellulose, that obtained from the seed of the date the least.

FERNS. See **BOTANY**.

FIELD COLUMBIAN MUSEUM. See **ANTHROPOLOGY**.

FIJI ISLANDS are a group in the Southern Pacific belonging to Great Britain, and having an area of 8,045 square miles and an estimated population on December 31, 1896, of 120,500, of whom 3,292 were Europeans, 1,201 half castes, and the remainder divided among Indians, Polynesians, Rotumans, Fijians, and others. The largest island in the group is Viti Levu with an area of 4,250 square miles, and the next in size is Vanua Levu, with about 2,600 square miles. The surface is hilly and the soil fertile, owing to the abundant rainfall. The islands are well wooded and have luxuriant vegetation. Among the chief products and exports are sugar, copra, fruit, distilled spirits, and cotton. There are many plantations on the islands and tobacco, sugar, cotton, and a variety of tropical fruits are raised on them. The greater part of the trade is with the colonies of Great Britain, especially with New Zealand, New South Wales, Victoria, and New Caledonia. With Great Britain the direct trade is very small. Between 1891 and 1896 the total foreign trade fluctuated considerably, being £727,383 in 1891, rising to £867,633 in 1894, and falling to £677,834 in 1896. Most of the natives have abandoned their idols and become professed Christians. The Wesleyans were the earliest missionaries to attempt the conversion of the islands and in 1896 the number of persons in regular attendance at the churches of the Wesleyan mission was 96,421. The work of the Roman Catholic mission has also been important and in 1896 the number attending Roman Catholic missions was 9,437. The political status of Fiji is that of a crown colony in which a Governor assisted by an executive council is at the head of the administration. There is a legislative council under the presidency of the Governor, having six official members, and six unofficial members, nominated by the Crown. In 1898 the Governor and Commander-in-Chief and High Commissioner for the Western Pacific was Sir G. T. M. O'Brien.

FILTERS. See **SEWAGE PURIFICATION AND WATER PURIFICATION**.

FINANCE. The treatment of financial topics in this volume will be found under the head of the principal countries. See also the separate articles **CURRENCY REFORM**, **TARIFF**, **BANKS—BANKING**, **MONEY**, etc.

FINLAND is a Grand Duchy of Russia with an area of 144,255 square miles and a population in 1897 of 2,483,249. Its agricultural importance has declined since its incorporation with Russia but it has greatly advanced in respect to fisheries, cattle-breeding, and manufacturing industries. Its chief crops are oats, rye, barley, potatoes, peas, wheat, and flax; and there are various manufactories including iron and mechanical works, dress and dyeing establishments, wood and bone industries, and factories for the production of leather, paper, chemicals, and textiles. The exports from Finland in 1896 were 158,900,000 marks, and the imports 172,600,000 marks. The chief countries to which Finland exported in 1896 were, in the order of their importance, Russia, Great Britain, Denmark, France, Germany, Sweden and Norway, and Spain. The most valuable of the exports were the products of the forest, timber, butter, paper, cardboard, iron, and iron goods. The State has built and at present owns almost all the railways. The railway mileage in January 1897, was 1,505, all but 20 being the property of the State. The standard is gold, and the unit of value is the *markka*, which is equivalent to about 20 cents in United States money (19.3 cents in 1898). The predominant religion is Lutheran, and at the end of 1896 the members of this church numbered 2,473,441. Next in importance is the Greek Orthodox Church, whose members, together with the Raskolniks, numbered 46,509. There is one university at the present capital, Helsingfors, a flourishing institution with 2,010 students (1896). As to the education of children, a United States Consul reported in 1898 that there were 1,400 schools supported in part by the government, and of these 21 were intermediate schools. Attendance at school begins at the age of ten, children between the ages of seven and ten receiving instruction at home by the parish priest. Co-education has been introduced in the schools and in the university with success. Adequate instruction is given to men and women teachers, and the latter are said to be especially capable. Never-

theless it was stated in this same Consular Report that only about 38 per cent. of the population in Finland can read and write. Finland has a national parliament of its own consisting of representatives of the four estates, namely, nobles, clergy, burghers, and peasants. The Emperor of Russia, who is the Grand Duke of Finland, summons this assembly, and in legislation has the right of initiative and veto. The highest administrative authority is exercised by a Senate which sits at Helsingfors, and whose members are nominated by the Emperor and presided over by the Governor-General of Finland. This Senate controls provincial affairs, while military and foreign affairs are for the most part directed by the imperial officials. An important event in the political history of Finland during the year 1898 was the issue of an imperial ukase for the purpose of bringing the Finnish law of military service into harmony with the law in force in the other parts of the empire. Hitherto Finland has enjoyed a certain independence in military affairs, the Finnish regiments not being required to serve beyond the limits of the Grand Duchy. In the fall of 1898 it was reported that a special meeting of the Diet was to be called in the following January to give official sanction to the imperial plan.

FIRE BOATS. See FIRE PROTECTION.

FIRE PROOFING. See TALL BUILDINGS (paragraph Fire Proofing).

FIRE PROTECTION. Supplementary systems of water mains and fire hydrants have been installed during the past few years at Cleveland, Milwaukee, Detroit, Buffalo, Providence and Boston to afford a more ample supply and higher pressure than can be obtained from the regular water works system. The latest instance is at Boston, where the supplementary plant was put in operation in the latter part of 1898. This system uses salt water, while the others named use fresh water. At Boston, a 12-in. cast iron main 5,000 ft. long, extends from the shore to a point near the post-office, affording special protection to the business district. Two fire boats may be connected with the fire mains by means of hose. Hydrants of special design are placed at intervals on the fire main and there is an electric signal system between the boats, hydrants and some of the near-by fire stations. The main is kept filled and under pressure. The valves are of composition metal, to prevent rust, and are insulated from the iron mains by means of rubber to prevent galvanic action. At Providence, a special system of fire mains was put in operation in October 1897. These are supplied from the high service of the regular waterworks, but are devoted to fire protection.

The new fire boat, Robert A. Van Wyck, for the New York Fire Department, went into service in April 1898. Its hull is of steel, 111 ft. long over all, 24 ft. beam; draft, loaded, 9 ft.; displacement, load water line, 307 tons. She is provided with two sets of pumps, which on test delivered about 3,200 gallons per minute each, with pump pressures of about 180 lbs. The boat was designed by Mr. H. de B. Parsons, of New York City.

FISHERIES. No more interesting or satisfactory occurrence in the records of fish and fisheries can be chronicled for the year 1898 than the new vigor which has come into the United States Fish Commission under Commissioner George M. Bowers. It must be admitted that the proposal of his name aroused the bitterest opposition of scientists and practical fish culturists and no little apprehension was felt when his nomination was confirmed. But in justice it must be said that there has not been a year since Professor Baird's death when the scientific side of the Fish Commission's work has received a larger share of attention, or when outside scientists have been more cordially assisted. The appointment by the Commissioner of Professor H. C. Bumpus as director of the Biological Station at Woods Holl, was a guarantee that that station would be loyal to the plans of Professor Baird, and was the first intimation of the liberal policy which has since been pursued. The station has been open to investigators since March and every courtesy and convenience have been shown to visiting biologists. The war with Spain deprived the commission of its best boats but the *Grampus* was in service at Woods Holl during August and September and proved of very great value. (See DISTRIBUTION, second paragraph.) But more than by simply assisting biologists, the Woods Holl station has proved its practical value by its additions to our knowledge of the distribution of fishes along the southern New England coast, and during the year several species have been added to the list of fishes known from that region. The Commission has extended these investigations along the southern shores of Long Island also. A very interesting study has been made of the color, size and proportions of flat-fish from various points in Buzzard's and Narragansett bays, which seems to show that fish from one locality are recognizably different from specimens of the same species taken only a few miles away. The Commission also began a biological survey of Lake Erie, making the station at Put-in-Bay, Ohio, the headquarters of a party of biologists, whose investigations, into the zoölogy and botany of the lake, have already more than warranted their appointment. The work will extend over the entire year and an elaborate plan for the study

of the fauna and flora of the lake has been outlined, and will be followed as closely as circumstances will permit. Experimental work is being carried on along a number of different lines, such problems being investigated as the rate of growth of fishes, the food of young fishes, etc. Observations on the food habits, distribution and migration of the lake fishes are also being recorded. Special attention has already been given to plankton problems. The whole work will have important bearings on the extensive fishing interests of the Lake and it is hoped will throw some light on, and offer some remedy for, the recent serious depletion in the supply of certain valuable food fishes. A similar survey has been planned for Great Salt Lake, Utah, from which very interesting results may be expected. The Commissioner has presented to Cornell University a large collection of fishes for its museum. From the point of view of a biologist, the Commission has never had a more useful year, and it is therefore doubly gratifying that from the practical side the year has been exceptionally prosperous and an unprecedented number of fish have been hatched and distributed. See ZOÖLOGICAL STATIONS (paragraph United States Fish Commission).

The fishing interests of the United States were represented by delegates at the second International Sea Fisheries Congress held at Dieppe, France, early in September. There were more than 300 members present, representing ten countries and more than 40 communications on fishery problems were presented. The Congress met in four sections discussing respectively scientific research, fishery apparatus, technical education and fishery regulations. Many of the papers were of great importance and aroused considerable discussion. One of the most important movements started was for a joint Anglo-Saxon biological and physical survey of the English channel during 1899. Resolutions were adopted recommending the prohibition of trawling within three miles of low water mark, and the sale of immature fish, the minimum size for each species to be fixed by an international committee.

At the meeting of the British Association at Bristol, the committee appointed some years ago on the "Life Conditions of the Oyster: Normal and Abnormal," and of which Professor W. A. Herdman was chairman, presented its third and final report. The result of their investigations will probably have a marked effect on the oyster fisheries of the United States as well as of Europe. Their important conclusions can hardly be more than mentioned here, but the facts from which they draw them seem to be well established. Greenness in oysters is not always due to pathological conditions nor to excess of copper in the animal, but in many cases it certainly is. The Colon group of bacilli (to which the bacillus of typhoid fever belongs) is frequently found in oysters and other shell-fish as sold in the towns, but there is no evidence to show that it occurs in those from pure sea-water. On the other hand, it must not be assumed that the presence of Colon bacilli invariably indicates sewage contamination. No typical bacilli of typhoid were found in any shell-fish examined. Nevertheless the committee recommends that the greatest care to prevent sewage contamination should be taken both by the government and by the oyster dealers themselves, and further that oysters imported from abroad should be carefully inspected and certificated. The recommendation is also made that the grounds from which mussels, cockles and other mollusks are collected should be inspected as carefully as the oyster beds themselves.

One of the most interesting undertakings in the world of fisheries was brought to an unsuccessful termination in the spring of the year, in the attempt of the "Caribbean Sea Fisheries Development Syndicate" to carry on fishing in West Indian waters on a large scale. It has long been a curious fact that while a large part of the food of the inhabitants of Jamaica is fish, a very large proportion of it is imported as salt-fish. In view of the apparently great abundance of fish all around the island this fisheries company anticipated that a properly equipped steam "trawler" would be able to do a flourishing business in the capture and sale of these fish by wholesale. Accordingly the *Capricornus* was chartered in England and sent to Jamaica with an experienced crew and a full supply of the best apparatus. Operations were begun outside of Kingston harbor on January 27 and were continued until well into April. The results were disappointing in the extreme, as the whole amount of fish taken was absurdly small. The most remarkable fact was the apparent absence of fish, but even if they had proved as abundant as was expected, it is probable that a steam-trawler would not pay, for two very curious reasons. Trawling is itself out of the question in most places about the island, owing to the abundance of coral, which tears the nets to pieces or prevents the dragging of the trawl at all. In only a few places was a coral-free bottom of sufficient extent for trawling found, and in such places very few fish were taken. Line fishing on a large scale is equally out of the question, because the sharks and barracudas are so abundant that they eat the fish off the lines before the latter can be properly handled. These two obstacles, so foreign to the trawl-fishermen of the north Atlantic, seem to make the development of fisheries in the tropics on a large scale impossible. Although from a commercial point of view this attempt has proven such an unfortunate failure, yet the results

have been of no little importance to all interested in the biological questions involved as well as to those interested in the development of the industries of the West Indian region. See BEHRING SEA DISPUTE and CANADA.

FISHERIES SOCIETY, AMERICAN, organized in 1871, has 250 members. President, George F. Peabody; secretary, Herschel Whittaker, Detroit, Mich. Its next meeting will occur at Niagara Falls, June 28-30, 1899.

FLAG ASSOCIATION, AMERICAN, founded June 2, 1898, to secure national legislation for the protection of the flag from degrading and desecrating uses and to secure a general celebration of June 14 as "Flag Day," because on that day 1777, Congress selected the flag of the United States. President, Col. Ralph E. Prime; secretary, Gen. Thomas Wilson, 56 E. 76th street, New York.

FLAG HOUSE AND BETSY ROSS MEMORIAL ASSOCIATION, AMERICAN, has its headquarters in the Old Flag House, 239 Arch street, Philadelphia. President, Edmund Brooks; Secretary, John Quincy Adams, 101 W. 89th street, New York.

FLORENCE, the capital of the former duchy of Tuscany in Italy, lies in the valley of the Arno, about 123 feet above the level of the sea. It had, according to the estimates of December 31, 1896, a population of 207,100. An event of interest to Americans in 1898 was the centenary celebration in honor of Amerigo Vespucci, the discoverer, and Paolo Tasconelli, the inventor of the quadrant. An appropriation for this purpose was made by the municipality of Florence, and the time for the festivities was fixed in the month of May. Among the features of the celebration were the unveiling of commemorative statues of Vespucci and Tasconelli by King Humbert, and the display of valuable unpublished documents relating to the services rendered to science by the two famous Florentines.

FLORIDA, the southernmost of the United States, has an area of 56,680 sq. m. Capital, Tallahassee.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1898: corn, 4,244,472 bushels, \$2,122,236; oats, 623,099, \$336,473; potatoes, 116,032, \$139,238; hay, 10,008 tons, \$141,113; and cotton (season of 1897-8), 53,657 bales, \$2,177,021—total value, \$4,916,081. The cotton crop was 29,001 bales of upland and 24,656 of sea-island. Live-stock comprised, horses, 37,673; mules, 8,354; milch cows, 114,251; other cattle, 325,774; sheep, 83,598; and swine, 429,128—total head, 998,778.

Industries.—The last revolution in Cuba prompted an experiment in Florida, which in 1898 had reached the condition of a distinct industry. Secretary Wilson, of the United States Agricultural Department, estimates that fully 40,000 Cubans, thoroughly acquainted with growing, curing, and manufacturing tobacco, had emigrated to Florida. These Cubans soon recognized the fact that the hummock lands of Florida, hitherto principally producing timber, cereals, sugar cane, sea-island cotton, and oranges, according to elevation, are very similar to the best tobacco land in Cuba. Till within a short time the stock of tobacco manufactured in Florida was grown and cured in Cuba. During the calendar year 1897 there were made in Florida 145,652,240 cigars, 4,425,580 cigarettes, and 28,983 pounds of smoking tobacco, and the sales of cigars aggregated 160,000,000. All these were sold in the North as Havana cigars. It is impossible to determine what proportion of this tobacco was grown and cured in Florida, but it is believed that it was considerable. Dr. Stockbridge, of the agricultural experiment station at Lake City, spent much time in 1897-8 experimenting with fertilizers and methods of fermentation to promote tobacco-growing. The sponge industry is steadily increasing in extent and value. Heretofore Key West was the principal market; now St. Marks, Cedar Keys, and Anclote are sharp rivals; and operations are carried on between Tampa Bay and St. Marks, a distance of about 150 miles. This industry now has an annual value of over \$600,000. See FULLER'S EARTH.

Commerce.—During the fiscal year ending June 30, 1898, the imports of merchandise at the ports of Appalachicola, Key West, Pensacola, St. Marks, Tampa, Fernandina, St. Augustine, and St. Johns aggregated in value \$1,136,730, and the exports, \$11,029,516, a decrease in a year of \$652,355 in imports, and \$400,681 in exports.

Transportation.—The total railroad mileage reported at the end of 1896 was 3,125. The legislature in 1897 created a State railroad commission; incorporated the Sanibel Island, the West Florida Gulf Coast, the Alafia, Manatee, and Gulf, and the Tallahassee and Central Florida railroad companies; and extended the time for beginning or completing the Titusville, Canaveral, and Peninsular, the Jacksonville and Tampa Bay, and the South American and International railroads. The new railroad commission is the absolute arbiter of the carrying trade, and can compel all railroads to do its bidding. The law gives the commissioners greater powers than any other State has yet delegated, and places all railroads in the State under an

authority that would be exceedingly dangerous if not exercised conservatively. In September 1897, interest in the agitation for a navigable canal across the peninsula was increased by the incorporation in New York of the Florida Transpeninsular Ship Canal Company, capitalized at \$75,000,000, to construct a ship canal and railroad from St. Augustine to a convenient point on the Gulf of Mexico.

Banks.—On October 31, 1898, there were 15 national banks in operation and 10 in liquidation. The active capital aggregated \$1,300,000; circulation, \$358,552; deposits, \$5,198,496; and reserve, \$2,275,258. The State banks June 30, 1898, numbered 21, and had capital, \$710,000; deposits, \$2,083,065; and resources, \$3,068,054. The exchanges at the United States clearing house, in the year ending September 30, 1898, amounted to \$10,836,179, an increase of \$2,647,664 in a year.

Education.—At the end of the school year 1896-7, there were 165,300 children of school age, of whom 105,415 were enrolled in the public schools, and 69,477 were in daily attendance. The percentage of enrollment by races was: white, 66.18; colored, 65.45. Public school property was valued at over \$600,000, and the expenditures were \$713,443, including \$547,172 for teachers' salaries. There were 28 public high schools; 7 private secondary schools; 2 public and 4 private normal schools; and 6 colleges and universities, co-educational and for men only. The Florida Agricultural College at Lake City, endowed by Congress, received from the Federal government \$22,000 in 1897, and \$23,000 in 1898. In the last year there were 164 periodicals, of which 21 were dailies, 123 weeklies, and 10 monthlies.

Finances.—The assessed valuations in 1897 comprised, real estate and railroad and telegraph property, \$79,369,887; personal property, \$15,747,269—total, \$95,117,156; State tax rate, \$3.50 per \$1,000. The bonded debt January 1, 1898, was \$1,275,000, of which \$922,300 was held by State funds and the balance by individuals. There are also bonds for borrowed money, aggregating \$200,000, of which the school fund holds \$175,000, and the internal improvement fund \$25,000.

Population.—As estimated by Federal officials, the population on June 30, 1898, was about 510,000. Local estimates gave Jacksonville, 26,000; Tampa, 25,000; St. Augustine, 4,740; and Palatka, 3,030.

Events of 1898.—An event of importance in Florida during 1898 was the ratification of agreement between the Dawes Commission and the Seminole nation of Indians on July 1. The land allotted at \$5, \$2.50, and \$1.25 per acre (200,000 acres at \$1.25) was bought from the Creek nation. (See FRIENDS OF THE FLORIDA SEMINOLES.) Funds were set apart for churches and schools, and intoxicants are ruled out. The Democratic convention, held on August 8, frankly and boldly condemns imperialism in the following words: "We condemn the policy of insular territorial expansion upon which the Administration at Washington has embarked, as unwise, un-American, unjust to the masses of our people, and especially to the laboring and producing classes, and as dangerous to our free institutions; and we pledge the Democracy of Florida to the opposition to the same; that whereas the present war with Spain was inaugurated for the declared purpose of aiding the Cuban patriots in their struggle for liberty and in the efforts to establish a free government, and we have solemnly announced to the world that we have no intention to annex the island of Cuba to the United States; and whereas war at best is unchristian, demoralizing in its tendencies, and a drain upon all the resources of the country, therefore, when the declared objects of the present war shall be accomplished it will be the duty of the government to grant peace on terms just to this government and honorable to our people, and that in the adjustment of such terms of peace Cuba should be left free by this government and untrammelled by our army and navy to establish, by the free action of her people, a free and independent government of their own; that the Democrats of Florida will support the Administration in all efforts to conduct the present war to an early, honorable, and satisfactory close; and that it would be an act of bad faith on the part of our government and a blot upon our civilization for us, as a result, either directly or indirectly of the war, to annex the Island of Cuba to the United States, and thus to rob the Cubans of that free and independent government for which they have fought so long." See the article UNITED STATES.

Officers.—The delegates to the House of Representatives are Stephen M. Sparkman (Dem.), from Tampa, and Robert W. Davis (Dem.), from Palatka. The Senators are Stephen R. Mallory (Dem.), from Pensacola, and a Democrat. Officials: William D. Bloxam, Governor; J. L. Crawford, Secretary; James B. Whitfield, Treasurer; W. H. Reynolds, Comptroller; W. B. Lamar, Attorney-General; Patrick Houston, Adjutant-General; W. N. Sheats, Superintendent of Public Instruction; and L. B. Wombwell, Commissioner of Agriculture. All are Democrats. Chief Justice, R. F. Taylor; Associates, M. H. Mahry and F. B. Carter, all of whom are Democrats. The State Legislature, consisting of 32 Senators and 68 Representatives, is unanimously Democratic.

FLUORSPAR. The output for the past two years was:

1897—5,062 short tons.....	\$37,159
1898—8,000 short tons.....	48,000

Kentucky supplied the greater amount, the Illinois mines being operated only in the early part of 1898. The American output is used in the production of hydrofluoric acid and opalescent glass, and in smaller quantities as a flux in blast furnaces and Portland cement manufacture.

FOLK-LORE SOCIETY, AMERICAN, founded in 1888 for the study of folk-lore in general and in particular the collection and publication of the folk-lore of North America. It publishes the *Journal of American Folk-lore* (quarterly). President, Henry Woods, Johns Hopkins University, Baltimore; secretary, W. W. Newell, Cambridge, Mass.

FONTANE, THEODOR, German poet, essayist, and novelist, died in Berlin September 21, 1898. He was born at Neuruppin, December 30, 1819. He was a voluminous writer on contemporaneous history, but the first of his writings that gave him prominence dealt with the literature, art, and drama of England. He published a number of novels and stories which were collected and published in 1890-91 in two volumes. Besides his essays and criticisms, his poems became well known, and so successful was he with this latter work that in 1891 his services were recognized by the Emperor by a gift of 3,000 marks. The greater part of his life was passed in Berlin.

FOOTBALL (1898). The result of the games between the so-called "Big Four" universities,—Yale, Harvard, Princeton and the University of Pennsylvania,—showed that Harvard probably had the best team, though she could not claim the championship, in view of the fact that no game was played with Princeton. Harvard defeated Pennsylvania on November 5 by a score of 10 to 0, and Yale, on November 19, by a score of 17 to 0. Princeton won from Yale by 6 to 0 on November 12. In the New England League, Dartmouth won the championship, having defeated Amherst by a score of 64 to 6, and Williams by a score of 10 to 6, but Dartmouth was defeated by Wesleyan by a score of 23 to 5. In the middle Western group, Chicago University secured the first place by defeating the University of Michigan by a score of 12 to 11, each having been victorious over all other competitors until they met. In the Western Intercollegiate Football Association, the University of Nebraska held the first place, having defeated the Universities of Kansas and Missouri by a score of 18 to 6 and 47 to 6 respectively. To entitle a college or university team to a place in the first class of football elevens it is required that they shall not only play a good game with one of the teams in that class, but shall occasionally defeat the latter. In 1898 the first class included Harvard, Princeton, Pennsylvania, and Yale; the second, Cornell, Carlisle, West Point, Chicago and Michigan, and the third, Wesleyan, Brown, Oberlin, Williams, Dartmouth and Amherst. The last three constituted the New England League. The general opinion in regard to the football playing of 1898 was that it was, on the whole, characterized by fairness, and few men were disqualified by rough play.

FORESTERS, ANCIENT ORDER OF, a fraternal society founded in England in 1745, and in America in 1839. There are in this country 3 high courts, 391 subordinate courts, and 37,108 members. High chief ranger, Edward Lightfoot, Portland, Conn.; high court secretary, Robert A. Sibbald, Park Ridge, N. J.; high court treasurer, Richard P. Shephard, New Haven, Conn.

FORESTERS, INDEPENDENT ORDER OF, a fraternal society founded in 1874, has now 36 high courts, 4,000 subordinate courts, and 140,000 members. Since 1874, \$5,959,240 has been disbursed, and in its last fiscal year \$992,225. Supreme chief ranger, Oronhyatekha, Toronto, Ontario; vice-chief ranger, Victor Morin, Montreal; secretary, John A. McGillivray, Toronto; and treasurer, Harry A. Collins, Toronto.

FORESTERS OF AMERICA, a secret society founded in 1864, reorganized in 1889, consists of 21 grand courts, 1,290 sub-courts, and 142,605 members. During its last fiscal year it disbursed \$782,485, and since its organization \$5,908,918. Supreme chief ranger, J. A. Shaw, Brooklyn; supreme sub-chief ranger, J. F. Kelly, Jersey City; supreme treasurer, T. F. Donahue, Providence; and supreme secretary, E. M. McMurtry, Brooklyn.

FORMALDEHYDE. During the past five years formaldehyde and its derivatives have been thoroughly tested and are now extensively used as disinfectants. Formaldehyde was first obtained by Von Hoffmann in 1868, from wood alcohol. It is a gas. Dissolved in water in the strength of a 38 or 40 per cent. solution it is sold in the shops under the name formalin. A polymer of formaldehyde occurs in a solid form under the name paraform. Most of the adverse testimony presented during the past year has been from those who used the vapor of formalin, or who used formaldehyde gas unaccompanied by moisture, or in cases where exposure of the infected

substances was too brief. Two methods have been chiefly employed. Trillat's method attempts to prevent the formation of polymers of formaldehyde by adding calcic chloride. His generator is called Trillat's autoclave. Its cost and weight are objections against it, and the results are far less satisfactory than those obtained from the simple alformant lamp of Schering. By the Schering method paraformaldehyde (paraform) is converted into formaldehyde gas by the action of the hot, moist products from the combustion of methylated spirit upon the paraform tablets. The probability is that by both methods the greatest part of the formaldehyde escaping into the air is converted into polymers. Schlossmann and Walter prevent polymerization by the use of glycerine, a hygroscopic substance. Ligner has constructed an apparatus which consists of a vessel, in which the water is boiled, so arranged that steam rises from it into a reservoir which contains 40 per cent. of formaldehyde and 10 per cent. of glycerine. This mixture is termed glycoformal. From this reservoir four pipes pass out into the room to be disinfected, which is rapidly filled with a mixture of formaldehyde, steam and glycoformal. A room of 60 cubic metres is so filled with vapor in ten minutes that an electric light in its centre is no longer visible. Microbes are killed in three hours at the longest. This process takes 4 lbs. of formaldehyde to every 1,000 cubic feet of space. The advantages are that sterilization is complete and absolute; closure of cracks is unnecessary; only three hours are required; there is no danger of explosion; the method is cheap; the glycoformal vapor is heavier than air, sinks and covers all surfaces thoroughly; and the total disinfecting powers of the gas are obtained. After the stated time has elapsed, the windows of the room are thrown open for a half hour. Then a solution of ammonia is placed in a vessel in the room, which is again aired, and all smell will be found to have vanished. This method is easily used by the unskilled. Live guinea-pigs and rabbits left in a room during this process of disinfection were found to be uninjured, while bacteria in their skins, their bedding, straw, etc., were killed. Formaldehyde has uninjurious effects on clothing, fur, feathers, paper, leather, photographs, india rubber or metal goods. It fixes blood spots, pus stains and other stains, but only slightly when they are very old. Disinfection is more rapid and certain in warm weather, when the room is warm and dry. Bed clothing must be hung up loosely, otherwise it is not sterilized on the interior surfaces. Reliance must not be placed upon the action of formaldehyde through more than one thickness of cotton cloth; but frequently test objects have been killed through one or two thicknesses of blanket during the ordinary time of exposure. Books may be satisfactorily disinfected in an ordinary steam chamber by formaldehyde gas. They must be stood widely open on perforated wire shelves, about a foot apart. Bindings, illustrations and print are in no way affected by the formaldehyde gas.

Schering's apparatus consists of a metallic cylinder with a receptacle for the pastils at its upper end, and a spirit lamp at its lower end. Each pastil consists of one gramme (15 grains) of formalin, and contains 100 per cent. of formaldehyde. This may be placed in a room upon the floor, or in a metal sterilizer in which instruments have been put for disinfection. Accordingly to many experimenters, 2 formalin pastils, of 1 gramme each, for every 35 cubic feet of room space, destroyed anthrax tubercle, diphtheria and typhoid bacilli, streptococcus pyogenes and staphylococcus pyogenes aureus (the bacteria of suppuration) as well as other bacteria in a few hours. In Schering's sterilizer, with an air space of less than one cubic foot, the vapor from 5 grains of paraform will kill anthrax or staphylococcus in 10 minutes, as shown by Reik and Watson, in *Johns Hopkins' Hospital Bulletin*. Dr Schweinitz and Burnett, of Washington, are authorities for the statement that instruments are not dulled by the sterilization. Park, Bacteriologist to New York Health Department, endorses the favorable reports on disinfection of dwellings, bedding, carpets, clothing, upholstery, etc., and advocates this method for disinfection of ambulances and other conveyances which can be tightly closed, formaldehyde gas to be used in the proportion of 10 per cent. by volume, the time of exposure to be not less than one hour.

FORMALIN, AS A REAGENT FOR BLOOD STUDIES. For general laboratory use formalin is an excellent preservative and fixing agent. It is less expensive and more easily operated than osmic acid. It causes no appreciable distortion of the cells and does not interfere with staining. The method used is as follows as reported by Prof. Kizer, of the biological laboratories of Purdue University:

"A quantity of freshly drawn blood, before coagulation has taken place, is mixed with at least three times its volume of a two per cent. formalin solution. After allowing the mixture to stand at least one hour, a drop from the bottom of the vessel is placed upon a cover-slip and a second cover-slip is pressed lightly upon it; then the two are separated and the liquid is allowed to evaporate. The dried cover-slip is pressed lightly upon it; then the two are separated and the liquid is allowed to evaporate. When cool, dip once or twice into a 5 per cent. solution of acetic acid. After removing the acetic acid with water, stain. If the corpuscles are nucleated, it is best

to use some contrast stain, as haematoxylin and eosine or methyl green with eosine or safranin. If an alcoholic stain is to be used, the films must be washed with alcohol before staining. Non-nucleated cells do not require a contrast stain. Human corpuscles may be stained with Ehrlich's triple stain. Remove excess of stain with water or alcohol as stain requires. Remove alcohol with xylol, clove oil, or turpentine. Mount in Canada balm."

The blood used in Kizer's studies was taken from the cat, chicken, ox, pigeon and man. Human corpuscles seemed to resist all stains until the films were treated with dilute acetic acid. The acid seemed to Kizer to clear the films and to cause the stain to become effective.

FORMOSA, an island lying off the coast of China, which was ceded by the latter power to Japan by the Treaty of Shimonoseki in 1895 after the war between China and Japan. It has an area of 13,541 square miles and a population estimated at nearly 2,000,000. Its chief towns are Taiwan-Fu, Tamsui, and Auping. The first two of these are open to foreign trade, as are also Takow and Kelung. The chief products are tea, sugar, rice, camphor, and coal. Large quantities of tea are shipped to the United States, and the production of this article has greatly increased since 1872. The Formosan Oolong has largely superseded the Amoy Oolong, which formerly controlled the market. It was found that the Formosan product was superior to the Chinese, and the Amoy merchants devoted themselves to the development of the Formosan trade. Rich new fields were opened, resulting in a great increase of production and a lowering of the price. After a while, however, the natives learning the high reputation of the Formosan Oolong, mixed with it the inferior product from the mainland and sold the tea, thus adulterated, as Formosan Oolong. Later the legitimate trade has greatly benefited from a law empowering a commission to reject the adulterated tea and the various grades of Formosan Oolong are now sent to the American market unmixed with the coarser quality of tea.

The Japanese conquerors showed considerable activity in the building of roads and the development of internal trade, but their work was checked by the insurrection of the natives in 1896. During 1897 the administration of the island was reorganized with beneficial results.

FORUM ROMANUM. See **ARCHÆOLOGY** (paragraph Italy).

FORZINETTI; Major, was the governor of the Cherche-Midi prison, one of the military prisons of Paris, in which Alfred Dreyfus was confined. In November, 1897, he published an account of the conduct of the prisoner during his confinement, and in this he said that in spite of all attempts to browbeat him, and in spite of frequent cross-examinations, Dreyfus maintained his innocence to the last. Forzinetti firmly believed that he had been unjustly condemned. It was he, too, who denied the existence of a confession by Dreyfus. See **FRANCE** (paragraphs on History).

FOSSIL BOTANY. The investigations in palæobotany, carried on or completed during 1898, are marked by the discovery of a large number of new species. Of the species described from the United States, 18 are from the Fayette formation; 12 from Florissant, Col.; 21 from the Lower Cretaceous of the Black Hills, and 1 from the Cretaceous of Staten Island.

The small number of text-books on palæobotany has been added to by the appearance of Vol. I of A. C. Seward's *Fossil Plants for Students of Botany and Geology*. The recently issued bulletin of the U. S. Geological Survey, by F. H. Knowlton, entitled a *Catalogue of Cretaceous and Tertiary Plants of North America* contains many new names.

D. White has described a new Lepidodendroid genus, *Ompholophloïos*.

FOSTER, JOHN WILSON, ex-Secretary of State, was appointed a member of the Anglo-American Joint High Commission which was created in May 1898. He was born in Pike county, Indiana, March 2, 1836; was graduated at the Indiana State University in 1855, and after a course of law at Harvard, was admitted to the bar and began to practice in Evansville, Ind. Upon the breaking out of the Civil War he entered the Union service as a major of volunteers, and at the close of hostilities had risen to the rank of brevet brigadier-general. He then became editor of the *Evansville Daily Journal*. President Grant appointed him minister to Mexico in 1873, the appointment being reaffirmed by President Hayes; he went as minister to Russia, 1880, and to Spain, 1883. Upon his return from the latter country he began the practice of law in Washington, D. C., and has since been a resident of that city. In November, 1890, he began a work in which he showed marked ability, namely, assisting President Harrison and Secretary Blaine in the negotiation of reciprocity treaties. He assisted in settling our dispute with Chile, and in the Behring Sea controversy he was appointed to conduct the case for the American government before the arbitration tribunal. Mr. Foster succeeded to the secretaryship upon the death of Mr. Blaine. In December 1894, he was requested to act as legal adviser to the Chinese plenipotentiaries who were negotiating for peace with

Japan. The government of the latter country acquiesced in the appointment, and Mr. Foster accepted. He returned in July 1895; much credit was given him for the prompt negotiation and ratification of the treaty of Shimonoseki.

FOUNDATIONS. See BRIDGES, TALL BUILDINGS (paragraph Foundations).

FOURNIER, HUGUES MARIE, French diplomatist and politician, died December 5, 1898. He was born in Paris, July 29, 1821. He was minister at Stockholm in 1862, ambassador at Constantinople in 1877, and was elected to the Senate in 1879.

FOWLER, SIR JOHN, K. C. M. G., LL. D., a well known hydraulic and railway engineer, died November 21, 1898. He was born near Sheffield, England, in 1817. Having been educated as an engineer, he constructed a number of important railway lines, and when twenty-seven years of age undertook the construction of the group of roads known as the Manchester, Sheffield, and Lincolnshire. He settled in London and was constantly engaged in engineering work. He was appointed in 1870 a member of the commission which was sent by the Indian government to Norway to investigate the railway system in that country. For many years he was consulting engineer to the Egyptian government, and for services rendered in Egypt and in the military campaigns in the Soudan he was made a Knight Commander of St. Michael and St. George. Many important railways, docks, river improvements, etc., including the London metropolitan underground railways, were designed and constructed by him. He will probably be best remembered as the engineer-in-chief of the great bridge across the Firth of Forth. For this work he was made a baronet in 1890.

FRANCE, the most westerly nation of central Europe has an area of 204,092 square miles, with a population on March 29, 1896 of 38,517,975, exclusive of Algeria and the colonies. According to the latest figures available in 1898 the colonies, protectorates, dependencies and spheres of influence of France had an area of 3,617,327 square miles and a population of 52,643,000. The chief cities of France are Paris with a population in 1896 of 2,536,834; Lyons with 466,028; Marseilles with 442,239; and Bordeaux with 256,906. The slow increase of the population of France makes its vital statistics a matter of special interest. The statistics in 1897 give an excess of births over deaths of 119,000, which was due to a falling off in the death rate. In the previous year both the number of deaths and the number of births were in excess of those in 1897. The slow increase of the population of France is due to the low birth rate. The number of emigrants is comparatively small. Out of a total of 285,873 French emigrants from 1857 to 1891, 59,304 went to the United States. During the year ending June 30, 1898, the number of emigrants from France to the United States was 1,989.

Production.—Of the vegetable products of France the most generally cultivated are, among grain crops, wheat, oats, rye, barley, maize and buckwheat, and among green and other crops, potatoes, beet root, grass and hay, clover and wine. The wheat production of France has shown a remarkable increase. In 1895 the area under wheat was 7,100,669 hectares and the crop amounted to nearly 120,000,000 hectoliters. In 1896 the area under wheat was 6,874,000 hectares and the crop amounted to 110,742,000 hectoliters. Wheat is exported, but France imports many of the other cereals although the value of such imports fell from 532,000,000 francs in 1891 to 162,000,000 francs in 1895 and to 123,000,000 francs in 1896. The manufacture of beet root sugar has greatly increased and the number of acres devoted to the raising of the raw product and the quantity of the raw product itself have steadily advanced. In 1896, 84,846,000 quintals of beet root for sugar were raised, a considerable increase over the previous year. In 1896 the production of flax seed and flax fibre each showed a falling off from the returns of the previous year. In 1896 there were 145,310 persons engaged in the silk culture, a falling off as compared with the previous year, and there was a considerable decrease also in the value of the cocoons exported and raw silk produced. It was reported at the beginning of 1898 that the outlook for the year's crops was very favorable and that a considerable percentage of increase would take place in most of the departments in the acreage under crop. The vintage of 1896 was an unusually good one and showed a considerable increase over the quantity for 1895 as well as over the average crop of the previous ten years. The report on wine production for the year 1897, however, showed that the average yield was 180 gallons per acre, which was about one-third less than in 1896, and that the total yield was less than the product of the latter year but about equal to the average for the ten years just preceding. The total yield for 1897 in all Departments was 727,791,000 gallons. The yield in 1875 was greater than it ever was before or has been since. Nevertheless, according to the statistics of wine production for 1897 in the seven chief wine producing countries of Europe, France stood at the head with Italy second and Spain third. On December 31, 1896, there were in France 2,489,658 horses; 260,521 asses; 208,791 mules; 13,334,631 horned cattle; 21,190,603 sheep; 6,402,370

wine; 1,499,005 goats, being an increase over the previous year in all except mules and goats. The chief mineral products of France are coal and iron. In 1895 the production of coal and lignite was 28,019,893 tons, of iron ore 3,679,767 tons, of pig iron 2,003,860 tons, of finished iron 756,793 tons, and of steel 714,523 tons.

Commerce.—In respect to trade France is one of the leading nations of the world. The French statistics divide the foreign trade into two classes, first the general trade, including all goods entering or leaving France and second, the special trade, including only imports for home use and exports of French origin. During the calendar year 1896 the imports and exports falling under the head of general commerce were in round numbers of the value of 4,929,000,000 francs and 4,594,000,000 francs respectively, in each case an increase over the previous year though not up to the annual average for the period 1891 to 1895 inclusive. Special commerce in 1896 included importations to the value of 3,799,000,000 francs and exportations of 3,401,000,000 francs. In 1898 a good deal of comment was caused by the falling off in the exportations. During the first half of the year 1898, while the imports showed a considerable increase over each of the two half-yearly periods preceding the exports fell off seriously. Efforts were made to ascertain the cause of this decrease which was viewed with some alarm because of its probably injurious effect upon French manufactures. It has been attributed in part to the fact that France has lost some of her foreign markets, which have become independent or have established protective tariffs excluding French goods. In 1898 a report of the French Bureau of Statistics and Commerce drew attention to the decrease of French exports and plans were discussed for the extension of the French foreign trade.

Labor Interests.—In July 1898 a law came into effect providing compensation for workmen in cases of accidents which caused disablement for more than four months. In case of complete and permanent disablement the workman receives an amount equal to two-thirds of the wages; in case of permanent partial disablement one-half of the diminution of wages which is caused by the accident; in case of temporary disablement one-half of the wages which the laborer was earning at the time of the accident; in case of death from accident an annuity of one-fifth of the wages to the surviving wife or husband or certain allowances to the surviving child or children, or if there is no surviving parent or child, a certain allowance to relatives dependent upon the deceased. See SOCIALISM, STRIKES AND LOCKOUTS, and WAGES.

Finance.—The chief sources of the ordinary revenue are the direct and indirect taxes and the state factories and monopolies. Of the direct taxes, according to the budget estimates for 1898, the most productive were trade licenses, the real property tax on houses and land, the personal and property tax and the tax on doors and windows. Of the indirect taxes, which yielded according to the estimates for 1898, 59 per cent. of the revenue, the most productive were the customs duties, the tax on spirits, the tax on sugar and the registration tax. The government monopolies and factories include tobacco, posts, telegraphs and telephones, matches and gunpowder and a considerable revenue is derived from the state domains and forests. The chief branches of expenditure according to the budget estimates for 1898 were the service of the public debt, the maintenance of the army and of the civil administration. The budget estimates for 1898 give the total revenue at 3,413,916,088 francs and the total expenditure 3,413,780,536 francs. In 1898 the Brisson cabinet proposed to substitute a new source of revenue for the personal property tax and the tax on doors and windows but was retired before anything was decided upon. On January 1, 1896, the national debt was placed at 31,094,356,744 francs.

Currency.—France is a member of the Latin Union, according to the terms of which the gold and silver coins of the five contracting states are of the same fineness, weight and value. The gold coins commonly used are the 20 and 10 franc pieces and the silver coins are the 5, 2, 1 and $\frac{1}{2}$ franc pieces and 20 centime pieces. France takes a monetary census every six or seven years and according to that of September 15, 1897, the total value of the specie in France was 6,375,000,000 francs, of which 1,935,000,000 francs consisted of 5 franc silver pieces, 240,000,000 francs of divisional silver coin and 4,200,000,000 of gold coins. Of the total amount, 5,260,000,000 francs were in French coin.

Army.—There is universal liability to military service for Frenchmen between the ages of 20 and 45 who are not declared unfit. The budget for 1898 placed the peace strength of the French army at 546,044 officers and men; the army in Algeria at 55,911 officers and men; and the army in Tunis at 13,458 officers and men, making a total of 615,413. It was estimated that the total strength on a war footing, including the reserve and territorial forces, was 4,670,000 men. Besides the active army, in which three years service is required, there is the reserve of the active army with ten years service, the territorial army with six years, and the reserve of the territorial army with six years. A plan of gradual reorganization was being

carried out in the year 1898 in accordance with the law of 1897. One effect of this will be to increase the infantry on a peace footing by 50,000 men.

Navy.—France has one of the strongest navies of Europe, ranking, it is said, next to Great Britain in this respect. Naval management is under the Minister of Marine. The navy is recruited partly by conscription and partly by voluntary enlistment. At the close of 1897 the following figures were given for the navy: 18 first class battleships, 10 second class, 9 third class; 16 port defense ships; 11 first class cruisers, 14 second class, 2 third class; 12 lookout ships; 13 gunboats; 119 first class torpedo craft, 78 second class, 45 third class. There were in process of construction at the close of 1897, 2 battleships; 15 cruisers; 2 lookout ships; 6 torpedo gunboats; and 13 torpedo craft of the first class.

Among the armored vessels recently built or in process of construction may be mentioned the Iena and the Bouvet, each of over 12,000 tons burden; the Charles Martel, Carnot, Charlemagne, Masséna, Brennus and Jeanne d'Arc, each between 11,000 and 12,000 tons; the Hoche, nearly 11,000 tons; the Henri Quatre, nearly 9,000 tons; and the Bouvines and Tréhouart, between 6,000 and 7,000 tons. There was great activity in France in naval affairs especially in the autumn when the Fashoda incident threatened to involve the country in a war with Great Britain. The principal squadrons were reconstituted and the work of preparing the fleet for war was begun.

Colonies.—The French colonies include: in Asia, French Indo-China, Anam, Cambodia, Cochin China and Tonquin; in Africa, Algeria, French Congo and Gaboon, French Soudan, Senegal, Guinea, Dahomey, Madagascar and Tunis; in America, French Guiana, Martinique, Guadeloupe and dependencies, St. Pierre and Miquelon; in Australasia and Oceanica, New Caledonia and dependencies and the Society Islands. The special trade of France with her colonies was estimated in 1896 at 359,000,000 francs for imports and 346,000,000 francs for exports and it was said that 41 per cent. of the imports into the colonies came from France and 43 per cent. of the exports from the colonies went to France. Algeria had the largest commerce of all the French colonies and the trade with France, which was valued in 1896 at nearly \$83,000,000, was about three times that with other nations; the chief articles of export were wine and sheep. Madagascar, though larger and more populous than Algeria, had a comparatively small trade. The American colonies of France, though comparatively small, have a valuable trade, especially Martinique and Guadeloupe. Further details in regard to the most important of the French possessions will be found in the separate articles on the colonies themselves.

HISTORY, 1898.

In 1898 the two topics that overshadowed all others in the discussion of current French politics were the Dreyfus affair and the relations with Great Britain. For this reason a large proportion of this review is taken up with these matters, and especial attention is given to the former as the more complicated and the more persistently thrust upon public notice.

The Conviction of Dreyfus.—In the autumn of 1894 Captain Alfred Dreyfus, an officer in the French army, was tried and convicted by a secret court-martial of having sold or given secret military information to a foreign power, presumably an enemy of France. The sentence was very severe. He was degraded in the presence of the army (January 4, 1895) and imprisoned on the Isle du Diable near the coast of French Guiana. During his trial and afterwards he constantly protested his innocence, and there was soon a widespread suspicion that unfair methods had been employed in his prosecution. The power to which he was said to have sold the military secrets was presumed to be Germany, but the German government repeatedly gave assurance that no communication had ever been received from Dreyfus. Thus there arose a conviction that Russia was the power that had received the secrets. Captain Dreyfus was transported March 10, 1895, and for two years comparatively little was heard of the matter, but in the autumn of 1897 rumors arose to the effect that some one was about to prove his innocence, and for several months the Dreyfus affair was the centre of public attention.

The Bordereau.—In November 1897, Mathieu Dreyfus, the brother of the convicted officer, claimed to have found proofs that the document which Captain Dreyfus was charged with writing was in reality written by Major Esterhazy. This document, known as the *bordereau*, in which the writer imparted the secret information to the foreign government now became the subject of constant discussion. It was seen that the handwriting was strikingly similar to that of Major Esterhazy, whose record as an officer and as a man was such as gave grounds for suspicion. He was said to be greatly in debt and not above resorting to unscrupulous measures to escape from his embarrassment. The handwriting experts gave different opinions as to the authorship of the *bordereau*. Esterhazy immediately denied the authorship

THE PALACE OF THE MINISTRY OF FOREIGN AFFAIRS IN PARIS.—In the foreground (Place de la Concorde) stands the obelisk presented to Louis Philippe by Mohammed Ali, Viceroy of Egypt. Beyond, the Pont de la Concorde leads to the Palais Bourbon, now the Chamber of Deputies. Still beyond may be seen the dome of the Invalides, under which Napoleon I. is buried. On the right is the Palace.

and every other point in the charges made by the friends of Dreyfus. A mysterious veiled lady now figured in the case. Esterhazy claimed that this person had placed in his hands definite proofs of the guilt of Dreyfus.

The Zola Letters.—Early in December, 1897, Major Esterhazy applied for a court-martial. The court-martial was opened on January 10, 1898. It was conducted publicly until Lieutenant-Colonel Georges Picquart appeared as witness. The doors were then closed and the council continued in secret session until the verdict was announced on the following day. It was a unanimous vote for the acquittal of the defendant. Now the case took on its most dramatic aspect with the appearance of the novelist Zola as a champion of Dreyfus. On January 13, *L'Aurore* a daily paper edited by M. Perreux, published a letter of Zola's in which he accused by name the officers of the army and the members of the war office of deliberately falsifying in the Dreyfus case. He claimed also the complete innocence of Dreyfus. This remarkable document, known as the "I accuse" letter, from the frequent repetition of that phrase, abounds in the most sweeping statements and the most fiery language. The following passage is worthy of citation:

"I accuse Lieutenant-Colonel du Paty de Clam of having been the diabolical workman of judicial error,—unconsciously I am willing to believe,—and of having then defended his calamitous work, for three years, by the most guilty machinations.

"I accuse General Mercier of having made himself an accomplice, at least through weakness of mind, in one of the greatest iniquities of the century.

"I accuse General Billot of having had in his hands certain proofs of the innocence of Dreyfus, and of having stifled them; of having rendered himself guilty of this crime of *lèse-humanité* and *lèse-justice* for a political purpose, and to save the compromised staff.

"I accuse General de Boisdeffre and General Gonse of having made themselves accomplices in the same crime, one undoubtedly through Clerical passion, the other perhaps through that *esprit de corps* which makes of the war offices the Holy Ark, unassailable.

"I accuse General de Pellieux and Major Ravary of having conducted a rascally inquiry—I mean by that a monstrously partial inquiry—of which we have, in the report of the latter, an imperishable monument of naive audacity.

"I accuse the three experts in handwriting, Belhomme, Varinard, and Couard, of having made lying and fraudulent reports, unless a medical examination should declare them afflicted with diseases of the eye and of the mind.

"I accuse the war offices of having carried on in the Press, particularly in *L'Eclair* and in *L'Echo de Paris*, an abominable campaign, to mislead opinion and cover up their faults.

"I accuse, finally, the first council of war of having violated the law by condemning an accused person on the strength of a secret document, and I accuse, the second council of war of having covered this illegality, in obedience to orders, in committing in its turn the judicial crime of knowingly acquitting a guilty man."

Effect of Zola's Accusations.—Naturally enough this letter created a great sensation. The friends of Dreyfus believed that a malicious conspiracy had been formed against Captain Dreyfus. On the other hand, the supporters of the army held firmly to belief in Dreyfus's guilt. One of the most respected of French citizens, M. Scheurer-Kestner, after studying the proofs for a long time, declared his belief in the complete innocence of Dreyfus. A few days after the publication of the letter, General Billot made a formal complaint against Zola, and Perreux, the manager of *L'Aurore* and it was understood that they would be prosecuted by the government in a short time. Popular indignation rose to a perfect frenzy. France had not seen such an exhibition of fanaticism and popular madness since the days of 1848. The reason for this was threefold. In the first place the agitation against Zola and the friends of Dreyfus was due to the feeling that the army had been insulted. To attack the honor of the army was regarded as no better than treason, for the success of France and her safety from attack depended solely on the strength of her military, and to declare the existence of such widespread corruption among its chiefs was to disorganize and demoralize the whole force. In the second place, it was believed that the relations of France with a friendly nation were involved; and finally Dreyfus being a Jew, Anti-Semitic sentiment was called into play. The main point of Zola's charge was that Dreyfus was convicted by means of a secret document which he was not allowed to see. To the world at large this seems so gross a violation of justice that popular acquiescence in it is hardly credible; but to the French people any means of convicting Dreyfus seemed righteous. The attitude of the war office and the government generally was explained by the claim that a full exposure of the grounds of conviction or the reopening of the Dreyfus question would involve France in difficulties with a country with which she was at peace. The question of reopening the Dreyfus case came up in the Chamber

of Deputies and the government declared officially that the case should never be opened. M. Méline said, "There is no Dreyfus case and can be none," and the Minister of War, General Billot appeared before the deputies and repeated this assurance. He said, "For myself in my soul and conscience as a soldier and chief of the army I regard the sentence as just. Dreyfus is guilty."

The Government's Attitude.—Thus it was evident that every effort would be made by the government in the trial of Emile Zola to suppress all attempts to exculpate Dreyfus, and this was shown by the selection of the passages in the letter on which the charge against Zola was based. The passages were as follows:

"A council of war has just dared to acquit an Esterhazy in obedience to orders—a final blow at all truth, at all justice. And now it is done! France has this stain upon her cheek; it will be written in history that under your presidency it was possible for this social crime to be committed.

"They have rendered an iniquitous verdict which will weigh forever upon our councils of war, which will henceforth tinge all their decrees with suspicion. The first council of war may have been lacking in comprehension; the second is necessarily criminal.

"I accuse the second council of war of having covered this illegality in obedience to orders in committing in its turn the judicial crime of knowingly acquitting a guilty man."

From this it appears that the government based its charges solely on those passages which related to the trial of Major Esterhazy, ignoring the most vital points in the letter of accusation. A second letter from M. Zola complains of this and taunts the government with cowardice, saying that it feared an open discussion and sought to tie his hands. This was undoubtedly the aim of the government.

Attitude of the Defense.—The defense was firm in its resolve to force the Dreyfus matter again upon the public notice. Many thought that it would be successful. The government seemed to give a chance for this by quoting the passage of Zola's letter which charges the second council of war (*i. e.* the Esterhazy court-martial) with attempting to cover the illegality of the previous trial, for it was hard to see how the defence could maintain this statement if it was not allowed to prove that the previous trial, that is the trial of Dreyfus, was illegal. Even if the defense were confined to a discussion of the Esterhazy affair it was clear that they could point to some rather damaging facts in regard to the government's trial of the case. Esterhazy, in his private letters, had declared that he wished he were a German Uhlan and admitted that he was in such desperate circumstances that he was ready to commit a crime in order to obtain money. He was, furthermore, a man of irregular life and so beset by pecuniary difficulties that he was constantly seeking aid from prominent Jews in Paris. He was said to have declared that he hoped "soon to see all those ignorant and cowardly chiefs of his go to people German prisons," and that it "would be an immense delight to put to slaughter 150,000 Frenchmen as a captain of Uhlans." Nevertheless at the time of his acquittal he was congratulated on all sides. As he left the building in which the trial was held his fellow officers stood in line and raised their hats as he passed, and outside the building he was surrounded by crowds of enthusiastic people.

The Anti-Dreyfusards.—Besides the almost fanatical reverence of the French for the army, another and more important reason accounts for the singular excitement over the Zola-Dreyfus case. It was a part of the Anti-Semitic movement which had been gathering force in France for several years. The spokesman of this crusade was M. Drumont, the editor of *Libre Parole*, a somewhat unprincipled sheet which never ceased to pour out abuse against the Jews. It was believed on all sides that a powerful Jewish conspiracy existed for the betrayal of France, that Dreyfus had many accomplices and that in their anxiety to disprove his guilt and save themselves they had plunged into another conspiracy against an innocent man. The charges against Esterhazy were thought to rest mainly on the treachery and malice of this Jewish syndicate. So the Zola trial brought on a most extraordinary outburst of religious bigotry. Riots occurred in the streets and the police were obliged to guard the homes of prominent Jews. Some of the Clericals went so far as to suppose or pretend that Protestants had allied themselves with Jews in this traitorous project. Anti-Semitic and Anti-Dreyfus demonstrations occurred in Paris and throughout France. In Algeria the riots took even a more violent form and resulted in the killing of several persons. When Zola appeared in defense of Dreyfus he became the centre of public attacks. Cries of "Down with Zola," "Spit on Zola," "Long live the Army" were heard on all sides. Zola's partisans were equally noisy, but far less numerous. As soon as the Dreyfus matter was broached in the Chamber of Deputies it was the signal for the wildest disorder and the most violent language. On January 23d, the angry discussion in the Chamber culminated in a fight in which both the members on the floor and the spectators in the galleries took part. Troops had to be called in to clear the galleries, and at the end of the session

it is said that over one hundred neckties were picked up on the floor of the Chamber.

The Trial of Zola.—The trial began on February 7th. Zola's counsel was M. Labori, and the well known party leader, M. Clemenceau, defended M. Perreux, the publisher of *L'Aurore*. The same scenes of violence and disorder were repeated in the court room. There were continual cries of "Down with Zola" and "Hurrah for Rochefort," which the efforts of the court were unable to repress. On the first days of the trial it appeared that hardly any of the witnesses summoned for the defense intended to attend the trial. These witnesses were chiefly officers of the army, and members of the war office, and they refused to testify on the ground that the Dreyfus case could not be reopened. Some, however, assigned sickness as the reason, and others the refusal of their superiors to allow them to attend the trial. One of the most important witnesses, Colonel du Paty de Clam, gave no excuse whatever for his refusal to testify. Nevertheless in most cases the court overruled the refusal of the witnesses and obliged them to appear. It was the constant effort of the defense indirectly to bring in the Dreyfus matter, and of the prosecution to forestall and thwart them. According to the ruling of the court Zola was forbidden to prove that Dreyfus was condemned unjustly. The testimony of M. Scheurer-Kestner was very important. He said that he had learned in September 1896, that Colonel Picquart had discovered the identity of Esterhazy's handwriting with that in the *bordereau* and had become convinced that the verdict against Dreyfus was erroneous. The affair was now brought to the attention of General Gonse who at first favored the investigation of the case. Other officers high in authority however refused to admit the possibility of Dreyfus's innocence. Several of them declared on their conscience that Dreyfus was guilty. The army officers summoned to appear at the trial maintained silence in regard to the Dreyfus case. There was no way for the defense to prove the story of the secret document, since the officers refused to testify. Nevertheless the attitude of General Mercier was significant on this point. When asked whether he had submitted a secret document at the Dreyfus trial without the knowledge of the accused and of his counsel, he said that he could not reply to that question. By many this was viewed as an admission that the accusation was correct. All testimony, however, that tended to prove the existence of this secret document was rejected by the court, and it was only incidentally ventilated through the adroit handling of the case by the counsel for the defense. Colonel Picquart testified that he had been constantly hampered in his investigations of the Esterhazy case when these investigations seemed to lead to a proof of Esterhazy's guilt. Experts who had testified in the Dreyfus matter would not reply to M. Labori's questions on the ground that they would be reopening the Dreyfus matter in disobedience to the court's orders, and the military authorities refused to submit the original *bordereau* for comparison with Major Esterhazy's handwriting. But experts called on behalf of the defense testified to the identity of the two.

It is not necessary to go further into the details of the case. As reported in American and English papers, the conduct of the trial was characterized by what, to the Anglo-Saxon mind, appears the grossest perversion of justice. Still it must be said that only Zola's side of the question was stated at length in this country and in England. Little attention was paid to the speeches of the prosecution and very few of them were reported at all. Again several aspects of the trial which seemed to Americans very irregular were characteristic of all French trials. For instance, the privilege accorded to witnesses of digressing from the points at issue for the purpose of making long political or patriotic harangues is characteristic of French legal procedure. Admitting all this, however, it is hard to see the course followed by the government in a favorable light. Public opinion in foreign countries was as unanimous in favor of Zola as public opinion in France was unanimous against him. The chief defense which may be urged on behalf of the French people is their enthusiastic devotion to the army, and their belief that the very existence of the Republic depended upon it. They could not forget that Dreyfus was convicted by a unanimous verdict of seven prominent military officers, and on the testimony of twenty-seven others. They saw in Zola's accusations an attempt to drag in the mud the names of the chief representatives of France and of the army. They cared not whether Dreyfus was convicted on a secret document or not. They believed in his guilt and were willing to trust the chiefs of the army when they refused to make the events of the trial public. The French people honestly believed that the reopening of the Dreyfus case would imperil the Franco-Russian Alliance. The trial lasted fifteen days, terminating February 23, 1898. After a deliberation of forty minutes the jury unanimously rendered a verdict of "Guilty" against Zola and Perreux. The former was sentenced to twelve months, the latter to four months, and each to a fine of 3,000 francs.

Anti-Semitism.—Major Esterhazy was quoted as saying at the time of the Zola trial "If Dreyfus were ever to set foot in France again there would be 100,000 corpses of Jews on the soil. If Zola is acquitted there will be a revolution in Paris. People

will put me at their head in a massacre of the Jews." This is a good illustration of the height to which the popular excitement had wrought itself. The indignation against Zola and Dreyfus gave way to a general hatred to the Jews. The leader of the Anti-Semites was Edouard Drumont of the *Libre Parole*. To him every Jew was an object of hatred and suspicion. The Zola trial was merely a means for furthering the Anti-Semite movement. He professed to find in the Jews the real rulers of French society, working through underhand means, to be sure, but always supreme. He agitated constantly for the repeal of the laws providing for the political equality of the Jew. He would have them set apart by law from the other classes of the community, claiming that they had always remained a race apart, never comprehending the true genius of French life and never sympathizing with the patriotic ideals of their fellow-countrymen. The general tenor of his writings is that the Jews must be proscribed, that if they are not proscribed they will be massacred. He of course believed firmly in the guilt of Dreyfus. Undoubtedly the Jews sympathized with Dreyfus and his friends, but the talk of a Jewish syndicate organized for the purpose of procuring his release, by any means however corrupt, was probably groundless. "There is no syndicate of Jews to free Dreyfus" said Zola, "there is no syndicate of Jews the world over for any purpose." He found in the attacks on the Jews merely the feeling of jealousy on the part of Christians over the superior skill of the Jew in financial matters.

French Opinion of the Case.—The above outline of the Zola trial is based on the information published in the press of this country. It is in the main correct, but there has been a tendency in the presentation of the case both in the United States and in England to ignore the attitude of the opponents of Zola, and it is interesting to note what a prominent French publicist, Baron Pierre de Coubertin, says on behalf of the government. In the first place he holds that whatever may be said of the innocence of Dreyfus, Zola utterly failed to substantiate his charges against the officers of the court martial. He thinks that it is absurd to doubt their sincerity, though equally absurd to doubt the sincerity of Zola, whom he characterizes as an enthusiast, earnest enough but obstinate and lacking common sense. He points out that Zola failed completely to convince even a minority of the French people of the guilt of the court-martial officers. Yet of course it was generally admitted that the trial was irregular. The followers of Zola he characterized as "a handful of second-rate men," men who represented the pessimistic and discontented element of the republic and whose aim was to make mischief and injure the government. In France they had little influence and deserved to have even less, but the result of their misrepresentations was to lead to international misunderstandings. Baron de Coubertin holds that in England and America public opinion went as crazy over the Zola affair as it was accused in those countries of having gone in France. He attributes the lack of sympathy shown by the French in the quarrel between the United States and Spain to the vengeful feelings aroused by the attitude of the American people toward this Zola affair. As to the irregularity of the trial and the unwillingness of the government to open the entire affair to the public, he attributes the evil wholly to the existence of the spy system in Europe. "So long as that spy system exists, it is quite absurd," he says, "to expect a trial of this nature to be publicly prosecuted. No such thing would ever be thought of in Germany, and France would act childishly by doing otherwise."

Renewed Discussion.—In the summer of 1898 the great majority of the French people were still so firmly convinced of the guilt of Dreyfus that they could not tolerate for an instant the thought of re-opening of the question. It was "*une chose jugée*," and anyone who dared to express a doubt of the justice of the court-martial verdict, or hint at a revision of the sentence was liable to social ostracism or even worse. Private citizens were insulted and threatened, civil officers degraded; military men were challenged to fight duels, all for mere expressions of opinion. The great mass of the people had heard enough of the affair, and every effort was made to muzzle the minority. Yet in spite of this the subject was again forced on public attention, and singularly enough by one of the very men who were unalterably opposed to revision. On July 7, M. Cavaignac, Minister of War in the new Brisson cabinet, made a speech, which in all sincerity he believed would convince everyone that Dreyfus was guilty and settle the matter once and for all. Unlike the other ministers who had merely expressed their positive conviction without adducing evidence, Cavaignac gave the grounds for his belief. These grounds were twofold. In the first place, there was an alleged confession of the accused, and in the second place, there were three incriminating documents, one of which mentioned Dreyfus by name, and afforded, it was said, irrefutable proof of his guilt. The speech was a great success, and by a nearly unanimous vote of the Chamber was ordered to be placarded in all the communes of France. But it was soon clear to the opponents of revision that Cavaignac would have done them a greater service if he had either said nothing at all, or adhered to the plan of his predecessors in

merely asserting Dreyfus's guilt without giving reasons. For these reasons were immediately called in question and the whole subject was revived. Cavaignac had blundered, and France again had to listen to the disagreeable discussion. The honor of the army, which somehow was supposed to be absolutely identical with the honor of a few of its chiefs, was now in greater peril than before.

In the first place Colonel Picquart wrote to the Premier M. Brisson, offering to prove in court that two of the documents read by M. Cavaignac had nothing to do with the Dreyfus case, and that the third bore all the marks of forgery. Next came the public assertion of Dreyfus's counsel that the letters had not been shown at the trial, and that therefore the accused had been condemned on evidence with which he was not confronted. M. Cavaignac, whose honesty in the affair has not been called in question now began investigations. The results were very important and most unfortunate from the point of view of those who wished the Dreyfus case be regarded as "*une chose jugée*."

The Documents in the Case.—The famous *bordereau*, the one piece of documentary evidence presented at the trial, was not referred to in M. Cavaignac's speech. He based his belief on three letters two of which had passed between the Austrian military attaché in Paris, M. Panizzardi, and the German military attaché, Colonel Schwarzkoppen, in the spring of 1894, while the third, apparently in the same handwriting, was written in the autumn of 1896. The first two do not mention Dreyfus by name, but refer to a certain mysterious "D." and in one of them appears the passage, "I enclose the plans of (giving the name of a French fortress) which that *canaille de D.* gave me for you." The third document, written in blue pencil, and apparently on the same kind of paper, was given to the authorities by Colonel Henry in October or November, 1896. Colonel Henry had been one of the members of the Dreyfus court martial, and at this time he was at the head of the Intelligence Department, having succeeded Colonel Picquart. He said the document had been given to him by one of his agents, who was employed to spy on the military attachés of foreign governments. The document fitted in admirably with the previous letters, and by giving the name of Dreyfus in full seemed to settle finally the question of identity. It referred to an attempt of the Chamber to interpellate the Government on the Dreyfus case.

Down to the close of 1896, it was supposed that the handwriting of the first two letters was that of Colonel Schwarzkoppen. The third note was presumably his also, for besides the apparent identity of handwriting, there was attached to it one of the Colonel's visiting cards. It contains the following passage. "I have read that a deputy is going to make an interpellation on Dreyfus. . . . I shall say that never have I had any relations with this Jew. That is understood. If you are asked, say the same. Nobody must ever know what has occurred with him." This was the irrefutable proof advanced by M. Cavaignac, in his speech. It was in fact the strongest point in his argument, and if it were disproved, his whole case would fall to the ground. He said "Thus the guilt of Dreyfus is clearly proven by a document of 1896, which perfectly fits in with a previous correspondence, and which demonstrates that guilt in an irrefutable fashion."

Colonel Henry's Forgery.—Now the objections urged at once by the doubters were: First the fact that Colonel Henry, who had always been a bitter opponent of revision, had admitted under oath at the Zola trial, that the document referring to "that *canaille de D.*" had nothing to do with the Dreyfus affair; second, the declaration of Panizzardi and Schwarzkoppen that they never had any relations with Dreyfus; third, the discovery that the handwriting in the first two documents was not that of Colonel Schwarzkoppen, but that of Colonel Panizzardi. This last fact gave color to the suspicion that the third document was forged by some one at the time when it was still supposed that Colonel Schwarzkoppen was the writer of the other letters, and this suspicion was increased by the style in which the last letter was written. It was evidently the work of an illiterate man, while the other letters were in good French, and it was known that both the military attachés were thorough masters of the French language. Finally there was Colonel Picquart's offer to prove that this letter bore all the marks of forgery. The proof of the worthlessness of these documents as evidence of guilt came about in a curious way. An officer who had figured in the Esterhazy inquiry was examining the third letter by an artificial light when he observed that the paper was not exactly the same as that on which the two other letters were written. The matter was brought to the notice of M. Cavaignac, and Colonel Henry was summoned before him to explain. Henry broke down and confessed that he had forged the letter in the autumn of 1896. The object of the crime was not clear. Henry himself merely said that he wished to make sure that the case would not be re-opened, and he did not realize the gravity of the offence. He was taken to prison, and soon after confirmed the sincerity of his confession by committing suicide. He cut his throat with a razor from his dressing

case. Thus the main ground of M. Cavaignac's belief in the justice of the Dreyfus decision was demolished.

Dreyfus's Alleged Confession.—As to the alleged confession of Dreyfus, which was adduced as supplementary proof of his guilt, the evidence appears to have been flimsy. It was said that he had confessed to one Captain d'Attel, but the latter's death made it impossible to obtain first hand testimony to the fact, and the authenticity of the confession rested merely on the alleged statement of this deceased officer, which was passed from one to another until it was reported by the fifth person to whom it was told. It was also said that Dreyfus had confessed to Captain Lebrun-Renaud, who accompanied him on the day of his degradation, but Lebrun-Renaud allowed more than two years to pass before stating that such a confession had been made, and the value of his testimony was impaired by the apparently well founded statement that in the meanwhile he had more than once explicitly denied that Dreyfus had made any statement to him at all.

Testimony of Foreign Officials.—As time passed it was generally admitted, that military secrets had been sold to the governments of Germany and Italy, and that a regular system of espionage was maintained through the German military attaché at Paris. It was thought that as soon as any important military plan was discussed in the war office in Paris it appeared in duplicate at the war office in Berlin, and that this information had been purchased from French officers by the Germans. As the guilt of Dreyfus became doubtful, suspicion pointed to Esterhazy; and in political circles in Germany and France it was believed that Major Esterhazy was in receipt of a regular salary from the German government, and that he employed the services of other French officers. Both Germans and Italians have repeatedly declared their belief in the absolute innocence of Dreyfus.

In the meanwhile the course of the Zola case had been as follows: After the sentence of Feb. 23, appeal was taken to the Court of Cassation, which granted it on April 2, and quashed the verdict. The ground of appeal was that the trial should have been brought, not by the war office, but by members of the Esterhazy court martial. On April 8, the latter decided to push the case against MM. Zola and Perreux, and the second trial began in the Assize Court at Versailles on May 23. After a second appeal by the defense to the Court of Cassation, the trial was suspended, but on July 16, this appeal was dismissed, and two days later the second trial was resumed. The defendants allowed the case to go by default, and again appealed. But the third appeal met with the same fate as the two previous ones. On July 2, Zola left Paris, and afterwards took up his residence in England. On the 9th of Sept., Major Esterhazy fled from France and was said to have hidden himself in London. Both he and Colonel du Paty de Clam were cashiered from the service.

Arrest of Colonel Picquart.—General Cavaignac retired from the cabinet in September, and was succeeded by General Zurlinden, the military governor of Paris. Under the administration of Zurlinden prosecution was begun against Colonel Picquart, who had offended the Anti-Dreyfus people by the zeal which he had shown in his investigations and by his declared belief in the innocence of Dreyfus. Colonel Picquart was placed on trial before the Correctional Tribunal, on the charge of revealing documents concerning the national defense.

When the Picquart case came up before the Correctional Tribunal the public prosecutor asked a postponement on the ground that the Minister of War had ordered the prosecution of the prisoner on the more serious charge of having forged documents. The request was granted and Col. Picquart was transferred to the prison of the Cherche-Midi. On this occasion he caused a great sensation by hinting that this was the last time that he would speak in public. He added that if he should be found dead like Picard the detective, who was found to have been strangled under suspicious circumstances, and like Henry, whose tragic death had recently occurred, it would not be a case of suicide.

Success of the Revisionists.—After the Henry confession the demands for revision were renewed and even in quarters where hostility to Dreyfus was known to exist an inquiry into the facts was desired. After the disclosures of Henry, Gen. Boisdoffre, who had previously staked his honor on the guilt of Dreyfus, resigned saying that his confidence in Col. Henry had been misplaced. Gen. Zurlinden, the successor of M. Cavaignac as Minister of War, resigned on September 17. The revisionist movement was gaining ground and on September 26, the cabinet decided that the demand for revision made by Madame Dreyfus after the revelations in the Henry affair had been made public, should be submitted to the Court of Cassation. This decision of the cabinet was reached after an exciting meeting and was followed by stormy scenes in the Chamber and on the streets. An account of the cabinet crisis and the formation of a new ministry is given in a succeeding paragraph but the main points in the history of the case to the close of the year can be briefly summed up here.

Decision of the Court of Cassation.—Toward the close of October, the Court having appointed a reporter to investigate the demand for revision took up the case for decision. The chief points which had been brought to the notice of the Court were as follows: It was urged that Henry's confessed forgery had invalidated the testimony which he had given in 1894; that expert testimony in regard to the *bordercau* was conflicting and that the letters of Esterhazy indicated that he was the author of that document. The Court decided on October 29 that there was ground for proceeding to a supplementary investigation, that the documents placed in its hands were not sufficient for it to decide on the merits of the case and that pending the supplementary investigation there was no ground for suspending the sentence against Dreyfus. This decision did not require that Dreyfus should be summoned at once to give his evidence, but the court notified him on November 15 that revision proceedings had begun and there was some slight mitigation of the rigors of his confinement. Down to the close of the year public interest centered mainly in the question whether the war department would submit to the Court the secret documents in the case. In the meanwhile Col. Picquart had applied for a decision upon the question whether a military or a civil tribunal should have charge of his case. On December 8 the Court of Cassation decided that the military prosecution should be suspended until after the Court itself had examined the documents. As to the submission of the secret documents in the Dreyfus case to the Court of Cassation, it was reported on December 23 that the war office would deliver them. Such were the main events in the history of the case to the close of the year 1898. Further information will be found in the articles on the persons whose names have been mentioned in connection with the affair.

The Méline Ministry.—The Chamber of Deputies would regularly have been dismissed in the autumn of 1897 but by special law it had been provided that the Chamber of 1893 should remain in session until the month of May, as that time was thought to be more suitable for the elections. The Chamber accordingly came to an end in May, 1898. In the elections that followed no very radical change was made in the composition of the Chamber. The Socialists, Guesde and Jaurés, were not reelected nor was the well known royalist, the Duke de la Rochefoucauld-Doudeauville. The Méline ministry remained in power. This ministry was formed in August, 1896, and its longevity has surpassed that of any ministry that preceded it under the Republic. Méline was the representative of the conservative Republicans whose triumph followed the downfall of the Radical ministry, including such men as Cavaignac, Berthelot and Lockroy, which came into power some eight months after the election of Félix Faure. The Radical party in France has held a rather ambiguous position. Some members of it have been most zealous in their expressions of sympathy with the Socialists, while others have never lost an occasion to attack them. Accordingly the Radical party has not been especially strong in France, and when it has come into power it has usually been a foregone conclusion that its overthrow was not far off. The Méline ministry owed its long life partly to the negative character of its programme. It did not represent the party of progress, nor did it stand for reactionary ideas. It held rather to what might be called a stationary programme, that is, it favored the maintenance of the *status quo* as the best thing for France. Its somewhat composite character and its lack of definite purpose prolonged its life amid the numerous and conflicting party programmes of the hour. There were some who held that a progressive policy in France was likely to be injurious to the maintenance of the Russian alliance. Méline's minister of foreign affairs, M. Hanotaux, has declared that it shall be the policy of the French Republic to "raise above all other cares the care of her alliances." The Russians could hardly be thought to sympathize with progressive ideas in France, and moderate Republicanism seemed best suited to fit the necessities of an alliance with autocracy.

The Brisson Ministry.—In the summer of 1898 the Méline Cabinet resigned, presumably on the ground that the desertion of the Radicals left it too small a majority to accomplish its purposes. In the two weeks from June 15 to June 29 another Cabinet was installed under the premiership of M. Brisson with M. Delcassé Minister to Foreign Affairs in the place of M. Hanotaux. The real motive of the resignation of Méline is hard to determine, but it has been said that he expected or hoped to obtain a stronger majority as a result of the elections in the spring of 1898. Besides this, he probably thought that his influence would be in no way impaired by the intervention of a new ministry. This new ministry was Radical in its composition. One of its leaders was M. Bourgeois, the well-known Radical. Its support in the Chamber was thought to be precarious, and it was not expected to remain in power long.

The Russian Alliance.—The Russian alliance still continued to enthrall the minds of the French people in 1898. Outside of France it was generally believed that the motive of this alliance was the idea of revenge. It was thought that the French favored it because they expected by means of it to regain what had been lost to Ger-

many. The Russian alliance, therefore, was generally regarded by outside nations as a menace to peace. In France itself, however, some of the more conservative thinkers saw in the Russian alliance not so much a menace to peace as a guarantee that peace would be preserved. These writers have held that the French people did not in reality desire war, that in fact to no people in Europe was the idea of war so repugnant. These men have seen in the Russian alliance a bulwark against German aggression. They have, however, for some time expressed a fear that while it would not be France who would draw Russia into war there might be a danger lest Russia would force France into a European struggle. In some quarters there has been apprehension lest the Franco-Russian alliance might draw France into war with England. There are constant dangers of conflict between the two latter powers whose colonies face each other in all parts of the world. But so long as there is a real desire of friendship on the part of the two peoples themselves this danger will be averted. Russian hostility to England, however, may, it is said, imperil the friendly relations of France with their Anglo-Saxon neighbor across the channel.

The World's Fair of 1900.—During 1898 preparations for the World's Fair of 1900 were actively carried on. An army of employees was already organized and foreign governments the world over were sounded as to their intention of coöperating with France in the great exhibition. Most of the foreign governments declared their readiness thus to coöperate and many appointed representatives.

The Niger Boundary Question.—The settlement of the long-standing dispute over the respective boundaries of the British and French colonies in the Niger region was reached by the signing of a convention June 13. This convention was the work of the Anglo-French commission, which had for many months been in session in Paris. For the terms of its agreement, see the article NIGER TERRITORIES.

Cabinet Crisis in October.—On October 25 there was an exciting scene in the Chamber of Deputies and the Brisson ministry was overthrown by a vote of no confidence. The trouble began with a tirade of M. Déroulède against the ministry, especially against the Minister of War, General Chanoine. The latter seems to have completely lost control of himself in his anger at this attack. He repelled the charge of disloyalty to the army, declared that he agreed with his predecessors in the belief that Dreyfus was guilty, and to the surprise of the Cabinet which had no warning of his action, angrily resigned his portfolio. Thereupon followed one of those mad uproars which are not unusual in the French Chamber. The members broke out into howls and soon came to blows. Premier Brisson went into the tribune and at last succeeded in making himself heard. He declared that it was the right policy of the government to maintain the civil power above the military. This affirmation was voted upon by the Chamber and the Government secured a small majority, but the uproar was renewed when a member declared that the Government must put a stop to the campaign against the army. Premier Brisson denied that the army had been insulted and at last the Cabinet demanded a vote of confidence on the question. This motion was lost by a vote of 286 to 234. The excitement spread from the Chamber of Deputies to the streets where the Anti-Semite spirit showed itself in cries of "Down with the Jews!" "Down with M. Brisson!" and "Long live the army!" There was some rioting and an occasional conflict with the police. Great apprehension was expressed in regard to the condition of affairs. Many seemed to think that the Republic was doomed. In the meanwhile, the Fashoda difficulty with England was left unsettled, but in France, war was considered impossible. See EGYPT.

The Dupuy Cabinet.—The Chamber adjourned on November 4. In the meantime there was a discussion with the President in regard to a new cabinet and after several conferences the new ministry was made up. It included as its principal members M. Dupuy as Premier, M. DeFreycinet as Minister of War, M. Lockroy as Minister of Marine, M. Delcassé as Minister of Foreign Affairs, the last named having been retained from the Brisson Ministry. In a declaration of its proposed policy the cabinet affirmed the supremacy of the civil power in the state. At the same time the army was not to be the butt in a campaign of insult, nor was it to find any falling off in the protection and regard to which it was entitled from the public authorities. The attitude toward the Dreyfus affair is suggested by the following sentence: "It is equally necessary that calmness attend the work of justice and our duty is to insure the executions of its decisions whatever they may be." The declarations of the ministry received the applause of the Chamber and approval was voted by a large majority.

The French View of the Anglo-Egyptian Expedition.—The French had watched the Sirdar's movement with the greatest interest. France has always tried to induce the British government to fulfill its pledge to evacuate Egypt. As soon as the Soudan should be regained as the result of Kitchener's expedition, the French urged that England's work would be accomplished and that she ought to evacuate the country directly or at least to set the time at which the occupation would terminate. Little hope, however, was felt that England would see her duty in this light. It is

interesting to read of the motives which French critics assign to her for insisting on remaining. They say that with the exception of a year or two at the beginning of the occupation she has always intended to remain in Egypt. Every year has seen her grasp tightened on the country. There has been too great a sacrifice of men and money to admit of her letting go her prey. The valley of the Nile has virtually been mortgaged to an extent that the Egyptian government can never pay. This mortgage is increased day by day. England must be the mistress of the Suez canal if she is going to prevail in African difficulties or in the questions of the Far East. A French writer prophesied that although England determined to retain Egypt she would not openly proclaim that intention, though she had recourse to the pretext which had previously succeeded, namely, that she could not evacuate the country until she had restored to Egypt that which she had caused her to abandon, and though these provinces were now re-conquered they must be reorganized, policed and opened up by railways and other means of communication. Until this work was accomplished England would remain in Egypt. After it was done and then only would there be any talk of evacuation.

The Fashoda Affair.—After the news that Marchand was at Fashoda reached France (see EGYPT), the Government awaited his report before returning a definite answer to the British demand for the evacuation of Fashoda. In October the danger of war between France and England seemed threatening. In a speech by Lord Rosebery the determination of all Englishmen, irrespective of party, to support the Government in its policy in regard to the Upper Nile was emphatically assured. Lord Rosebery said that there was a disposition on the part of the other European powers to take advantage of the supposed weakness or irresolution of the British government, and that if this went so far as to assume that Great Britain would show any less vigor in the defense of her rights than she had showed in the past, the assumption would prove to be a grievous blunder. Considerable excitement was caused by Lord Rosebery's speech and it was renewed by the speech of Sir Michael Hicks-Beach on October 19. The latter said that it was impossible for France to maintain that she has any political rights at Fashoda. He said that she was justified in waiting for Marchand's report but should she refuse to evacuate Fashoda after weighing all the evidence in the case the result would be most menacing to the friendliness of the two countries. Africa, he said, was big enough for both, for France in the West and Great Britain in the East, and he was confident of a friendly solution of the problem, but should the attempt at amicable settlement fail, he held that there were greater evils than war and that war on such an issue as this would not be feared by Great Britain, since she would go into it with a united people.

France's statement of her case was awaited with great interest in Great Britain. It was made public by the issuance of a yellow book on October 23. The main contention of the British was that in occupying Fashoda France had deliberately done what Great Britain had told her would be regarded as an unfriendly act. This demand on the part of England that France or any other power should keep her hands off in the Upper Nile region had been made by Sir Edward Grey in the House of Commons. The French Premier's answer to this was that the force at Fashoda was not Marchand's mission but Liotard's mission which had been authorized to reach the Nile long before Sir Edward Grey's declaration had been made. As to the rights of the matter, the French yellow book claimed that France had as good a right in Fashoda as Great Britain in Khartoum. France had not accepted England's claim to exclusive control of the Nile Valley and it is stated in this yellow book that M. Hanotaux had protested immediately against Sir Edward Grey's declaration. It was urged by the French that Liotard's mission had been undertaken in 1893 at the time when England considered the Soudan lost to Egypt.

Notwithstanding the French claim to Fashoda, it was stated that France would abandon that place if she could secure as compensation an outlet on the Nile for her African territory. The yellow book contains the correspondence between the two governments and some passages in this show on what delicate ground the negotiators were treading. The British communication dated Sept. 30 warned the French Premier that France in going toward the Nile was taking steps which would bring her into conflict with Great Britain. The French Premier doubted the correctness of this statement and retorted that the French were first at Fashoda, the British not having reached Khartoum until two months later and that to demand the French evacuation of Fashoda was to formulate an ultimatum. The French representative, Baron de Courcel, informed the British government that if France withdrew from Fashoda she would claim the valley of the Bahr-el-Ghazal as the necessary outlet on the Nile for her territories in the Congo basin. This demand was then laid by Lord Salisbury before the British Cabinet. The yellow book was discussed at great length in the British press. The British point of view seemed to be that the French Premier's assumption of equal rights and privileges in the Nile Valley showed a complete disregard of what had happened in that region during the last sixteen years. Englishmen refused

to admit that French and English were standing on a footing of equality there. The presence of French officers on the Upper Nile was regarded as wholly unwarrantable and their right of remaining there was not even to be discussed. The delimitation of the French and British territories was of course a proper subject of negotiation, but it would not be forgotten that England deserved something for her long years of labor and sacrifice in Egypt. The difficult feature of the whole matter at this juncture was the insistence of France on a *quid pro quo* for the withdrawal of Major Marchand—a demand which was especially offensive to the British because the latter regarded his withdrawal as their absolute right, for which no payment could be justly demanded.

The French Point of View.—The French view of the Fashoda affair was not clearly presented in the American account of this difficulty. A writer for the *Revue des Deux Mondes* gives a concise and moderate statement of the French side of the question, which is in substance as follows: The French Chamber met on October 25, 1898, and the ministerial crisis at once occurred. The Brisson Ministry was, as we have seen, immediately overthrown. To the English it seemed as if the French could attach but little importance to foreign affairs if in the presence of the international dispute over the Fashoda affair they could permit the government to fall into disorganization as the result of internal party strife. It seemed as if the Dreyfus case absorbed public attention in France to the exclusion of everything else. This view was not well founded. No matter how much factions might contend over domestic questions, there was virtual unanimity in regard to matters of national importance. There was but one foreign policy in France. M. Delcassé had the nation behind him in his efforts to maintain the rights of France as against Great Britain. He continued in his post as Minister of Foreign Affairs in the Dupuy Ministry that succeeded the Brisson Cabinet, and he maintained the same attitude toward the Fashoda affair. The comment of the French press on the negotiations between the two governments described in the two blue books published by the British government and the yellow book published by the French, was far more moderate than that of the British. In France it was recognized that there was no serious point of difference between the views of the two governments. The conversations between the British ambassador, M. Delcassé, on the one hand and the French ambassador and Lord Salisbury on the other, were reported in much the same terms in the official publications of the two governments. The essence of the controversy was not whether France should retain Fashoda, for on that point France did not insist. France claimed, however, that she had a perfect right to send her expedition to Fashoda. On the other hand, Great Britain claimed that this point of the Nile belonged to Egypt and in consequence was rightfully under the control of Great Britain. The French criticised Lord Salisbury's "picturesque expression" of "dormant rights." He said the Mahdi had held Fashoda by right of conquest, but now that the Mahdi was beaten it belonged to Great Britain. The "dormant rights" had persisted throughout all the revolutions of the Soudan and as the French put it had been re-awakened like the Sleeping Beauty by General Kitchener as Prince Charming. In France it was asked why it was that those rights ceased to sleep for the Mahdi and not for France. But after all it was held that the British might well be left to their own opinion. France had never expressed an intention of remaining at Fashoda and the only question at issue was on what conditions she should depart. The only danger in the situation lay in the harsh tone adopted by the British. France had nothing to complain of in Marchand's conduct or in the treatment which he had received from General Kitchener. The former's conduct in the affair was regarded with approval by his fellow-countrymen. Marchand had declared that he was at Fashoda merely in obedience to orders; that having reached that place he was attacked by the Mahdists and had repulsed them. When General Kitchener told him that the British regarded Fashoda as belonging to them and that Marchand would be required to evacuate the town, the latter replied that he would not leave until he had received fresh instructions from his government. When the Sirdar pointed out the utter hopelessness of any attempt on the part of Marchand to resist the Anglo-Egyptian force, the latter merely spoke of his duty as a soldier, and of his intention if necessary to die for his flag.

French Discussion of Lord Salisbury's Speech.—A French writer discussing the famous Guildhall speech of Lord Salisbury said that after all it is perhaps not a bad thing for a country to be obliged to beat a retreat in its foreign policy. Such an obligation was, he thought, imposed on France in the unhappy Fashoda affair. It was a trivial incident, and yet trivial incidents sometimes have consequences wholly disproportioned to their importance. It might have been settled more advantageously to France and with a fairer promise of peace in the future. France had no intention of going to war for Fashoda. It was evident says this writer, from the very first conversation between M. Delcassé and Sir Edmund Monson or between M. de Courcel and Lord Salisbury, that France would evacuate Fashoda. She had asked

only such terms as friendly nations substantially in accord have always been ready to grant each other. These terms had been unexpectedly refused and yet even now it did not seem worth while to depart from the friendly attitude that she had hitherto maintained. A comparison was drawn between the conduct of France in this matter and that of Germany when there was a risk of war with Spain over the Caroline islands. At that time Bismarck, who was certainly not lacking in aggressiveness or persistency, had said that Germany must withdraw her claims. The Carolines were not worth a war. To the French the conduct of England seemed incomprehensible unless she actually wished to prolong the strife. The French could not understand why she continued her armament and they were not satisfied with Lord Salisbury's explanation that when the work of armament had once been begun it could not be stopped at once. The spirit of Lord Salisbury's speech was regarded as distinctly warlike. On all sides he seemed to see dangers and a pressing necessity for Great Britain to be constantly on her guard. The French regarded this as almost a threat that Great Britain was about to pursue a policy which would result in war. Nor could they derive much consolation from the remark of the Duke of Devonshire, President of the Privy Council, on the same day at Eastbourne that: "Everybody knew that the Fashoda question was but an incident in a more important question." See GREAT BRITAIN.

In France such remarks were viewed as a warning to Europe. Special alarm was felt over that passage of Lord Salisbury's speech in which he refers to several nations fallen into decadence whose neighbors may some time, moved either by a high philanthropy or by a national desire for creating an empire for themselves contend with each other for the possession of these declining states. It was as if he invited competition in sharing the spoils of weaker nations. What nations were meant, it was asked; could it be Spain or Portugal? It was more likely that he meant China or the Ottoman Empire, or possibly Persia. And the remarks which he made in regard to the concert of Europe were not more reassuring. He had referred to it ironically, dwelling on its infirmities and the impotence which it had at times manifested. Nevertheless it had the merit of maintaining the peace, he said, and in the long run mankind will not readily pardon the man or the nation that shall bring countries to war. In France while it was believed that Lord Salisbury himself was sincerely in favor of peace the feeling of the British people on that point was generally distrusted. It was noted that the British press complained that Lord Salisbury had not gone far enough. It was said that the hatred of war which he had declared to be a characteristic of the English people did not take that practical form which it took some years ago when war was regarded as the last resort for kings and peoples.

French Criticism of the Foreign Policy of France.—The French people could not attach the blame for the unfortunate Fashoda affair to the existing government or to the government that immediately preceded. They placed the responsibility for it rather upon the national policy of the past. It was argued that if France wanted to bring the Egyptian question to a settlement she should have proceeded by way of Cairo instead of Fashoda. Had occupation been planned it was absurd to entrust the work to the inadequate forces of Marchand. Moreover if the government in the past had really hoped to bring the French colony of the Congo and of the Upper Ubangi into communication with the Nile it took a wrong way to realize that aim. It should never have admitted the theory of "dormant rights" or that the Soudan, whatever happened, continued to belong to Egypt and the Porte. If the French government had intended to oppose the interests of England in that part of the world, it should have taken advantage of the proffered alliance of the King of the Belgians on the Congo. France should not have gone to Fashoda alone. It was a profitless policy which the writer of the article above summarized compares to the act of the gardener's dog who protected his master's dinner against others but took nothing of it himself. The failure at Fashoda was the result of these mistakes of past years. France might have allied herself to Italy as well as to the Congo Free State. And the mere elements of political wisdom taught a nation to secure as many allies as possible when confronting a great power. Again, had France adopted this policy early enough Great Britain's ideas in regard to this region would not have attained their present fixity and strength. The French would have gone to the Nile under conditions that guaranteed success. As it was Marchand and his band had displayed great heroism and skill but it was wasted. Such in short was a sample of the comment and criticism in France upon the outcome of the Fashoda dispute.

Anti-Semitism.—On December 23, 1898, the cause of Anti-Semitism encountered a check in the Chamber of Deputies. The government's recall of Mayor Regis of Algiers on the ground of having incited Anti-Semitic disturbances led to an interpellation, and in the discussion of the matter the prominent Anti-Semite, Edouard Drumont, the representative of Algiers, sharply arraigned the government's policy. He declared that France should take warning from the example of Cuba; that

Algeria would become a second Cuba if the government's policy were continued, and like Cuba would be appropriated by a foreign power. He protested against the recall of Regis. Premier Dupuy retorted that Mayor Regis had been the cause of disorder in Algeria and had tried to obtain the recall of the Governor. The Premier attacked the Anti-Semitic movement as the revival of the ignorant and vindictive attitude of past times. The only way to deal with the aggressions of the Jews (for it was admitted that the Jews in Algeria had tried to obtain undue advantages) was by legislation. The Anti-Semitic party, he said, had been singularly barren of legislative measures for redress. Premier Dupuy's speech was loudly applauded and the government received a vote of confidence by a majority of 406 to 10. It was also voted by the Chamber that the speech should be placarded throughout Algeria. See ARCHÆOLOGY and FRENCH LITERATURE.

FRASER, Sir WILLIAM AUGUSTUS, M. A., English writer, died August 18, 1898. He was born in 1826; was educated at Eton and at Christ Church, Oxford; was Member of Parliament for Barnstaple (1852 and 1857), for Ludlow (1863), for Kidderminster (1874-80); he was lord of the baronies of Leanach and Balvraid. Among his publications are: *Words on Wellington, Disraeli and His Day, Coila's Whispers, London Self Governed, Hic et Ubique, Napoleon III.*

FREDERIC, HAROLD, journalist and novelist, died at Henley, England, on October 19, 1898. His death was keenly felt by both readers of the daily press and of current fiction, for he was stricken in the very prime of life. He was born near Utica, New York, August 19, 1856; his family was poor and his systematic education ended with the grammar school when he was fourteen. He obtained work as office boy, draftsman, and retoucher of photographic negatives, and when about twenty drifted into journalism. In 1880 he obtained a position on the editorial staff of the *Utica Observer*, two years later he became editor of the *Albany Evening Journal*, and in 1884, when he was twenty-eight, he went to London as European correspondent of the *New York Times*. From this time to the year of his death he put forth a large amount of work in the spheres both of journalism and of fiction. He did much to elevate the style of newspaper writing and free it from its too frequent crudity and vulgarity, while as a novelist he has shown us new types and conditions of American life in a way which if it does not mark the master, nevertheless reveals the writer of ability and force.

Mr. Frederic's experience before going to London was not very helpful for the development of a successful critic of European politics; but his energy, enthusiasm, and good sense soon gave him that broad and intelligent grasp of political problems which made him not only something of an authority in current history, but a man whose political judgment met with much consideration. Twice he made important excursions for obtaining knowledge first hand. At the beginning of his career as correspondent he made a personal inspection of those districts of southern France and Italy which at that time were infected with cholera; and in 1891, when the Anti-Semitic movement was increasing in Russia, he visited that country, and as a result published in the following year *The New Exodus: A Study of Israel*. Whatever success and whatever excellence Mr. Frederic may have attained as a newspaper writer, he will probably be better remembered as a novelist. His collected works of fiction comprise the following ten volumes: *Seth's Brother's Wife* (1887), *The Lawton Girl* (1890), *In the Valley* (1890), *The Return of the O'Mahoney* (1892), *The Copperhead* (1894), *Marsena, and Other Stories of the War* (1895), *The Damnation of Theron Ware* (1896), *March Hares* (1896), *Gloria Mundi* (1898), and *The Market Place* (1899). Of these books *March Hares* and *The Return of the O'Mahoney* are extravaganzas, exhibiting a kind of exuberant humor and fun that is rarely found in his other stories. His books show careful observation and fine comprehension of life in central New York, where most of his scenes are laid; in fact, although his geographical range was limited, he gave such a new and charming local color to American literature that his books will remain in vogue for years to come. His chief characteristic as a novelist was force and directness of manner, a clear and at times picturesque presentation of what he saw and felt. He used very little ornament and seemed to believe that perspicuity is the chief element of style. *In the Valley* is a stirring and vivid description of events in the Mohawk Valley preceding the Battle of Saratoga in 1777. The rest of his books deal chiefly with life in central New York from the sixties to the eighties, but *The Copperhead* takes the reader to scenes in Indiana. Probably his most popular work, and certainly his greatest one, is *The Damnation of Theron Ware*. Although it is not a pleasing story, is a powerful delineation of the strife between two religious ideals in a man's soul. His novels are not only excellent in themselves, but show promise that Mr. Frederic might have done work that was really of the first rank.

His untimely death aroused much discussion and much unfriendly criticism of the sect known as Christian Scientists (q. v.). For some time he had been suffering

from weakness, overwork, and heart trouble; finally Miss Kate Lyon, a member of Mr. Frederic's household, summoned a Mrs. Mills, a Christian Scientist, who treated Mr. Frederic according to the methods of her sect. The treatment consisted in the rejection of all regular medical assistance and merely in the prayer and "belief" that is practiced by the Scientists. Upon Mr. Frederic's death, Mrs. Mills and Miss Lyon were held by the coroner's jury as criminally responsible, since heart failure, the immediate cause of death, had been accelerated by the absence of medical treatment. Although Mr. Frederic had objected to medicines, there was no evidence that he believed in Christian Science, and it was shown that in his helpless condition he was under the full control of Mrs. Mills. The latter and Miss Lyon, however, were not indicted.

FREE CHURCH OF SCOTLAND, which seceded from the Established Church of Scotland (q. v.), in 1843, consists of a general assembly, 16 synods, 75 presbyteries, 1,165 ministers, 1,094 congregations. In 1898 £666,400 was raised for missions and other expenses. Moderator (1899), Rev. Alex. White, Edinburgh.

FREE MASONS. The reports of the Free Masons in the United States and British America for 1897-98 give 57 grand lodges and 817,227 members, showing a gain of 14,945 members over the preceding year. These lodges are in relation with the English grand lodge, of which the Prince of Wales is grand master, and with those of Germany, Austria, Ireland, Scotland, Peru, Cuba, South Australia, Victoria, New South Wales, and Mexico. The grand lodges and members are as follows: Alabama, 11,368 members; Arizona, 618; Arkansas, 13,663; British Columbia, 1,242; California, 18,808; Canada, 23,398; Colorado, 7,335; Connecticut, 17,053; Delaware, 2,126; District of Columbia, 5,144; Florida, 4,317; Georgia, 18,183; Idaho, 1,175; Illinois, 53,285; Indiana, 29,387; Indian Territory, 3,107; Iowa, 27,489; Kansas, 19,888; Kentucky, 18,464; Louisiana, 5,439; Maine, 22,085; Manitoba, 2,641; Maryland, 7,474; Massachusetts, 38,416; Michigan, 39,576; Minnesota, 15,691; Mississippi, 9,110; Missouri, 30,889; Montana, 2,706; Nebraska, 11,763; Nevada, 832; New Brunswick, 1,781; New Hampshire, 9,111; New Jersey, 16,543; New Mexico, 854; New York, 95,480; North Carolina, 10,370; North Dakota, 2,702; Nova Scotia, 3,409; Ohio, 41,713; Oklahoma, 1,340; Oregon, 4,906; Pennsylvania, 51,031; Prince Edward Island, 520; Quebec, 3,519; Rhode Island, 5,113; South Carolina, 5,853; South Dakota, 4,308; Tennessee, 17,588; Texas, 28,483; Utah, 790; Vermont, 7,758; Virginia, 12,803; Washington, 4,649; West Virginia, 5,983; Wisconsin, 16,946; and Wyoming, 1,011.

FREE SONS OF ISRAEL, INDEPENDENT ORDER OF, a fraternal society founded in 1849, has now 3 grand lodges, 102 subordinate lodges, and 13,000 members. Since 1849 it has disbursed \$6,066,000, and \$225,000 in its last fiscal year. Grand master, Julius Harburger, New York; deputy grand master, Adolph Pike, Chicago; secretary, I. H. Goldsmith, New York; and treasurer, Louis Frankenthaler, New York.

FRENCH CONGO AND GABOON is one of the largest possessions of France in West Africa, having an area of 497,000 square miles and a native population of about 5,000,000. It is bounded on the north and west by the German Cameroon, which it completely shuts off from the interior, and it stretches on the northwest to the southern shore of Lake Tchad. On the north it meets the independent native state of Wadai and the wide tract of country un-annexed by the European powers lying between the Soudan provinces and Egypt on the east and French Sahara on the west. Extensive forests cover its surface, but the soil where cultivated is fertile. The chief products are caoutchouc, coffee, ivory, ebony, redwood, palmetto, palm oil, and gum opal. It is watered by several great rivers, including the Gaboon, the Ogowé, and the Congo, which separates it from the Congo Free State on the southeast. France gained possession of the Gaboon estuary more than fifty years ago, but has only recently extended her authority over the interior. An agreement with Germany in 1894 settled the boundary between the Cameroon and the French territory, and France now has open communications from her Congo possessions to the portion of the Sahara which is within her sphere of influence. In 1897 and 1898 attention was drawn to this part of Africa by the efforts of the French to secure connection with the Nile valley in the east, in accordance with a general plan, it is said, for the extension of French influence entirely across the continent from her Congo possessions to Obock on the gulf of Aden. In the spring of 1897 Major Marchand set out from Brazzaville for Ubangi in the back country of the Congo colony, whence he was to proceed to the district of Bahr-el-Ghazal and the White Nile. The successful issue of this adventure brought Major Marchand to Fashoda, where his party hoped to join a party coming from Obock under M. Bonchamps by way of Abyssinia. Major Marchand's stay at Fashoda brought about the international complication between France and England which for the moment threatened to bring the countries to war. (See the article on EGYPT.) A recent writer on the French possessions of the Congo emphasizes the good work that the French have accom-

plished in that region in putting down the slave trade and the cruelties practiced by the trading Arabs. And this he says has been accomplished with the aid of a very small force of Senegalian troops, since the results have mainly been secured by peaceful means. The inhabitants of the coast region seem to be in a state of savagery and given to the practice of cannibalism, but not difficult to manage if principles of justice are strictly maintained. Toward the interior the people are in an even ruder stage, but along the Shari and the Ubangi rivers where Mussulman influence predominates, the condition of the natives improves. The French have tried to maintain friendly relations with the sultans, Rafai and Zemio, and it was by the aid of the latter that Marchand reached the Bahr-el-Ghazal, and descended one of its streams toward the Nile. The determination of the French to establish communication with the Nile assumed that the Egyptian government had been driven out of the Soudan by force and that therefore the abandoned provinces belonged to any nation that had the good luck to be the first to seize them. On the other hand England declared that Egyptian rights though dormant, were still existent over the Soudan, the whole of which was at one time undoubtedly administered by her. Since Egypt had evacuated the Soudan at the advice of Great Britain the latter power declared that she held herself in honor bound to return it. Gordon, himself, had actually visited Bahr-el-Ghazal, which, from its importance as a recruiting ground, was regarded as indispensable to the control of the Soudan.

FRENCH GUIANA, a colony of France lying to the east of Dutch Guiana, on the northeast coast of South America, has an estimated population of 22,714, and an area of about 46,850 square miles. The boundary lines, however, between it and Dutch Guiana and Brazil have not been definitely established. The capital is Cayenne, situated on a small island of the same name off the coast, and having 12,351 inhabitants. The administration of the colony is vested in a governor, council-general, and municipal councils, and there is a representative, or deputy, in Paris. The country is poorly cultivated and its trade unimportant. Gold is found and in 1896 101,938 oz. were exported; 58 per cent. of this came from the territory claimed by Brazil and the disposition of which was given over to a board of arbitration. April 1897. The local budget for 1897 was 2,770,000 francs; and the expenditure of France (the budget for 1898) was 6,161,000 francs. Of this latter amount 4,732,000 francs were for the French penal establishment; for French long-term prisoners are sent to either New Caledonia or French Guiana. The population of the penitentiaries together with the liberated convicts, amounts to about 4,500. Besides Cayenne, there are a few other small islands off the coast belonging to the colony, one of which is the Ile du Diable, where Captain Alfred Dreyfus was imprisoned after his conviction.

FRENCH GUINEA comprises the region on the northwestern coast of Africa, between Portuguese Guinea and the British colony of Sierra Leone, having a population of about 47,500; but it is united for administrative purposes with the Ivory Coast and Dahomey, including under the former designation the French settlements of the old Gold Coast, namely Grand Bassam, Assinie, Jackeville, and Grand Lahou; and under the latter the colony of Dahomey, comprising the districts of Porto Novo, Kotonu, Grand Popo, and Agoué, the rest of Dahomey being a French protectorate under the immediate government of a native king. On January 1, 1890, the colony of French Guinea was detached from Senegal and placed under a separate administration, the seat of government being Konakry, the capital of French Guinea proper. The products of the entire region include India rubber, palm oil, sesame, and gum. Each of the three districts has a governor and enjoys autonomy in local affairs, but in political and military affairs is subject to the Governor-General of French West Africa. An agreement between France and Liberia settled the boundary line on that side in 1891, and the Sierra Leone frontier was determined between England and France in 1895. The upper course of the Niger was guaranteed to France and the continuity of French territory in the hinterland of French Guinea was assured. The area of the French settlements on the Ivory Coast (including a portion of what was formerly known as the Gold Coast), together with those on the coast of Dahomey, is about 25,000 square miles. See DAHOMEY and NIGER TERRITORIES.

FRENCH LITERATURE. It is difficult to characterize the present trend of French literature, which seems to be distinctly in a transition state. Ferdinand Brunetière, the valiant champion of tradition, finds evidence in the publications of the past year,—and not only in such works as Victor Charbonnel's *Congres des Religions*, and Pierre Laffitte's *Le Catholicisme*, but also in dramas like Jules Lamaitre's *L'Ainée*, or *Les Mauvais Bergers* of Octave Mirbeau,—that more attention than ever is being paid to religious questions. On the other hand, a new critic, Charles Recolin, whose recent volume, *L'Anarchie Littéraire*, has attracted considerable notice, boldly asserts that the condition of the literature of the day is nothing less than anarchistic. As usual, the truth lies somewhere midway between the two extremes; but all that can be safely affirmed is that individualism seems to be still on the increase.

History.—Few of the leading historians are represented in the list for 1898. Albert Sorel, le Comte Vandal, Henry Houssaye and G. Hanotaux have published nothing beyond fragments of future works. We have, however, the Duc de Broglie's *L'Alliance Autrichienne*, at the period of the Seven Years' War, and *L'Alliance Savoyarde et la Duchesse de Bourgogne*, by the Comte d'Haussonville, which stands upon the dividing line between history and biography. Among general works should be mentioned M. Renouvier's *Philosophie Analytique de l'Histoire*, in four large volumes. Another important work is *Entretiens sur l'Evolution Historique*, by André Lefèvre, professor in the Ecole d'Anthropologie, at Paris. The author defines history as "an indefinite tissue of adventures determined by the expansion, the meetings and the passions of human groups," and predicts that a time will come when humanity will control the course of history. Of volumes relating to particular epochs of French history there are quite a number. Two deal with Louis XIV: *Les Grands Traits du Règne de Louis XIV*, by Dr. Henri Vast, and the first part of *La Politique Etrangère de Louis XIV*, by Edouard Waldteufel, who holds that, far from being the aggressor in his various foreign wars, the French king acted only on the defensive. The period of the French Revolution is treated in the following works: *Les Sections de Paris pendant la Révolution Française*, by Ernest Mellié; *Le 13 Vendémiaire An IV*, by Henry Zivy, and the fifth volume of Edmond Biré's excellent *Journal d'un Bourgeois de Paris pendant la Terreur*. *L'Armée de Bonaparte en Egypte*, by the Commandant Guitry, and the first part of the Commandant Margueron's *Campagne de Russie*, are two works which throw interesting light upon the Napoleonic campaign. The third volume of Emile Ollivier's *L'Empire Liberal* studies the foreign policy of Napoleon III, down to the war with Italy. Three works dealing with the Franco-Prussian War must be mentioned: *Paris: Le Bombardement et Buzenval*, by Alfred Duquet, to whom the Academy awarded the prix Berger; *Siège de Paris; Chatillon, Chevilly, la Malmaison*, by Pierre Lehautcour, who has already consecrated five volumes to the campaigns of the Loire, the East and the North; and a curious little volume of Souvenirs of a telegraph operator, M. J. Bitteau, entitled *Strasbourg: L'Armée de la Loire: l'Armée de l'Est*.

Other noteworthy publications are the first part of Charles de la Roncière's *Histoire de la Marine Française*, and the second volume of Godefroy Cavaignac's important work on *La Formation de la Prusse Contemporaine*, which covers the period 1808-1813. M. Gustave Saige, who at present has charge of the archives of the palace at Monaco, is the author of a history of that curious little state, based upon original documents.

Biography.—There is as usual no dearth of Napoleonic literature, and the list is headed by two volumes of *Lettres Inédits*, published by M. Lecestre, and consisting of certain letters which reflected little credit upon Napoleon's character and which were accordingly omitted by the editors of the *Correspondance*. A truer picture of the Emperor is obtained from Arthur Chuquet's two volumes on *La Jeunesse de Napoléon*, and two on *Napoléon et sa Famille*, by Frederic Masson, which are full of unedited documents. The latter author also published in December a masterly study of *Josephine Imperatrice et Reine*. Two interesting volumes of reminiscences are *Souvenirs et Anecdotes de l'Ile d'Elbe*, by Pons de l'Herault, director of the mines at Elba during Napoleon's sojourn; and a new edition of Dr. Antommarchi's *Derniers Momens de Napoléon*, which appeared originally in 1823 and is now for the first time republished with commentary by Désiré Lacroix. In addition to the volume by the Comte d'Haussonville, already mentioned, there are several biographies, whose chief interest is historical. Such are *Marie de Medicis*, by Berthold Zeller, forming the third volume of his history of Louis XIII; *Maryzienka, Reine de Pologne*, by K. Waliszewski, which has all the charm of an historical novel; *La Carrière du Maréchal Suchet*, by François Rousseau, and *Voltaire avant et pendant la Guerre de Sept Ans*, by the Duc de Broglie. To the same category may be added *Mémoires du Sergent Bourgogne (1812-1813)*, by Paul Cottin, and *Le Duc de Richelieu*, by Raoul de Cisterne. M. Léon Laforge completed the first volume of his *History Complète de Mac-Mahon, Maréchal de France*. Two new volumes in an admirable little series inaugurated by *Guillaume II Intime*, are *Bismarck Intime*, by Jules Hoche, and *Félix Faure Intime*, by Paul Bluysen, all of which have been regarded as works of exceptional interest. *Verlaine Intime*, by Charles Donos, which contains one of the most curious chapters in the history of contemporary letters, forms a convenient transition to biographies of men of letters; and in these the past year has been fertile. First of all should be mentioned two interesting collections of letters: *Correspondance entre E. Renan et M. Berthelot*, the fruit of life-long friendship, which almost does duty as a "Renan Intime" and the *Correspondance de Victor Hugo*, containing, among others, interesting letters to Lamartine and Baudelaire, to François Coppée and to George Sand. The last named writer is the subject of a delightful little biography, *Autour de Nohant*, by Edmond Planchut, who has here chosen to portray her rather as the "good lady of Nohant" than as the author of *Valentine* and *Indiana*.

A touching tribute to the memory of Alphonse Daudet is contained in the memoir written by his son, Léon, who has here given utterance to "those cries with which heredity and the love of his father had filled his respectful soul." The volume has been pronounced Léon Daudet's best effort. Still another Daudet, Ernest, has published a life of the Duc d'Aumale, which may be grouped here, since the latter was no less a master of the pen than a brilliant general. New volumes in the *Grands Ecrivains Français Series* are *Marivaux*, by Gaston Deschamps; *Racine*, by Gustave Larroumet; *Merimée*, by Augustin Filon, and *Corneille*, by Gustave Lanson. The last-named volumes partake quite as much of the nature of criticism as of biography; and the same may be said of *Lamartine, Poète Lyrique*, by Ernest Zyromski; and *Essai sur Chateaubriand*, by André Maurel.

Criticism.—M. Brunetière holds such a commanding position among French critics that it is only natural to give the first place to his admirable *Manuel de l'Histoire de la Littérature Française*, which appeared at the close of 1897. In his contention that André Chenier is the last of the classics, M. Brunetière finds supporters in Louis Bertrand, who has written *La Fin du Classicisme dans les Dernières Années du XVIIIe Siècle*, and Henri Potez, author of *L'Elégie en France depuis Parny jusqu'à Lamartine*. An important contribution to literary history is Prof. Paul Lacombe's *Introduction à l'Histoire Littéraire*, in which the author propounds such fundamental questions as: What is literature? What is style? and answers them in his own way, producing a conscientious, learned and altogether novel volume. Joseph Texte, the author of *Jean-Jacques Rousseau*, has again affirmed the importance of the comparative study of literature in a new volume, *Etudes de Littérature Européenne*; and Eugène-Melchior de Vogüé has gathered together, under the title *Histoire et Poésie*, a number of cosmopolitan studies, ranging from Robinson Crusoe to Gabriele d'Annunzio. Jules Lemaitre is represented in criticism this year by the tenth volume of his *Impressions de Théâtre*. Emile Faguet has been more industrious, having published not only *Drame Ancien, Drame Moderne*, containing interesting parallels between the Greek, French and English theatre, but also a second series of *Politiques et Moralistes du Dix-neuvième Siècle*, containing seven studies ranging from Saint-Simon to Auguste Comte. Edouard Rod also has two volumes of criticism: An admirable *Essai sur Goethe* and a second collection of *Etudes sur le XIXième Siècle*. Other noteworthy volumes are: *Etudes de Littérature Contemporaine*, by Georges Pellissier; *Pointes Séchées*, by Adolphe Brisson; a second series of *Etudes sur la Littérature Française*, by René Doumic; and *Le IIe Livre des Marques*, by Rémy de Gourmont, containing brief but admirable characterizations of a score or more of writers of the younger school, who represent certain extreme forms of their art. A capital book on the modern Italian poets is *La Poésie Italienne Contemporaine*, by Jean Dornis; and two excellent volumes on English literature are *Walter Scott et son Influence sur le Mouvement Romantique*, by Louis Maigron, and *Shakespeare en France sous l'Ancien Régime*, by J. J. Jusserand. A book which does not lend itself readily to classification is Mme. Arvède Barine's *Névrosés*, which contains valuable studies on Hoffmann, de Quincey, Edgar Allan Poe, and Gérard de Nerval.

Fiction.—A striking feature in recent French fiction is the growing tendency to write novels in trilogies. The most notable volume of this class for 1898 is undoubtedly Zola's *Paris*, the last of his series of *Les Trois Villes*, notwithstanding the fact that it appeared at an unfortunate time. It follows the career of the young priest, Pierre Froment, down to the severance of his connection with the Church; and incidentally charity is weighed in the balance and found wanting, as was faith in *Lourdes* and hope in *Rome*. Another trilogy has been begun by the brothers Paul and Victor Margueritte, who have for the past few years collaborated. The first volume, *Le Désastre*, deals with the capitulation of Metz in 1870, and naturally challenges comparison with Zola's *La Débâcle*, but as M. Brunetière has said, differs from it in "touching a still bleeding wound with pious hands." After a silence of several years, Maurice Barrès reappears with a new book, *Les Déracinés*, which marks an epoch in his career. This volume, which is also one of a series of three, belongs to the class of sociological novels, and was written as a protest against the present tendency on the part of young men to flock to Paris from the provinces. The second volume, *L'Appel au Soldat*, was completed during 1898, but for political reasons its publication has been indefinitely postponed: the third and last volume, *L'Appel au Juge*, lies altogether in the future. Still another cycle of novels, dealing with the Napoleonic epoch, has been projected by Paul Adam, of which the first volume, *La Force*, has just appeared. The same author published earlier in the year a strange collection of short tales, *Les Tentatives Passionnées*. One of the most delightful novels of the year is *Le Mannequin d'Osier*, of Anatole France, which follows his *Orme du Mail*, of the previous year. With a minimum of plot and action he has succeeded in giving a most convincing picture of contemporary life, enlivened by that particular form of indulgent irony for which M. France is renowned. Another volume of almost equal importance is Edouard Rod's *Le Ménage du Pasteur Naudé*,

in which the poor pastor learns by bitter experience that he cannot serve two masters; that he cannot serve God on the one hand, and Mammon on the other, in the shape of a young and capricious wife. Paul Bourget is represented by two volumes: three novellettes, united under the title of *Complications Sentimentales*, and one long novel, *La Duchesse Bleue*. The name originally chosen for the latter romance was "Three Artists' Souls," the three souls in question being those of a novelist, an actress and a painter; and their mutual relations are developed with that pitiless clairvoyance for which M. Bourget is renowned. Other novels, which, for want of space can merely be mentioned by name are, *Soutien de Famille*, the last novel by Alphonse Daudet, and generally acknowledged to be disappointing; *Jacquine Vanesse*, in Victor Cherbuliez's familiar manner; three volumes by André Theuriet, *Le Refuge*, *Lys Sauvage* and *Dans les Roses*; *La Cathédrale*, by J. K. Huysmans, who here continues the history of a religious evolution, begun in *La-Bas* and in *En Route*. *Gens de Poudre* is the name of Hugues Le Roux's latest book, the first of a series of novels of adventure, which he has undertaken to write on the conquest of Algeria. Among the works of comparatively new writers must be mentioned *Les Façades*, by François de Nion; *Saint Cendre*, by Maurice Maindron; *La Confession d'un Enfant du Siècle*, by Michael Corday; *Temple d'Amour*, by Rémy Saint Maurice; and *Lèvres Closes*, by Daniel Lesueur. The indefatigable "Gyp" has to her credit *Israel*, *Sportomanie*, and *Miquette*; and Georges Ohnet gives us his periodic volume in the shape of *Le Roi de Paris*.

Poetry.—Notwithstanding the large number of contemporary French poets, many of whom have attained distinction, few if any of the volumes of verse which have appeared during the past eighteen months, belong to the highest order of poetry. M. Le Vte. de Guerne, in his *Bois Sacré* still draws his inspiration from Leconte de Lisle's *Poèmes Antiques*, although he here gives evidence of more ease and liberty than in his earlier *Les Siècles Morts*. To the same order of poetry belongs *Jeux Rustiques et Divins*, by Henri de Régnier, who is one of the leaders of the younger school, and a poet of undoubted talent. Another young poet of whom much may be expected is Albert Samain, whose latest volume, *Au Jardin de l'Enfante*, contains some exquisitely musical verse. Philippe Dufour has written a volume of *Poèmes Légendaires*, to which M. de Hérédia furnishes the introduction, and which celebrate the sadness of love and the glories of patriotism. Anatole Le Braz is a writer justly admired, both for his prose and his verse, and the poems which he has united under the title of *La Chanson de Bretagne* have been declared by more than one French critic to embody the very soul of Brittany. Other collections of poems which deserve at least a passing notice are: *La Clarté de Vie*, by Francis Vielé-Griffin; *Poèmes Fabuleux*, by Heri Ronger; *Le Cœur Solitaire*, by Charles Guerin; *Poèmes de l'Amour et de la Mort*, by André Lebey, the author of *Chansons Grises*; *Sources vers le Fleuve*, by Robert de Souza, who has already attracted some attention by his *Fumerolles*; and a little posthumous volume of poems by Paul Guigou, entitled *Interrupta*.

Drama.—Many verse dramas have appeared during the past two seasons, including, besides M. Rostand's famous *Cyrano de Bergerac* (see ROSTAND), the *Frédégonde* of M. Dubout, and the *Martyre*, of Jean Richepin, both of which may be classified as pseudo-classic tragedy. The former of these is drawn from the *Récits Mérovingiens* of Augustin Thierry; the latter has been described by M. Brunetière as "a nondescript confusion of the essence of Christianity with the profanest element in the passions of love." For many reasons one of the most interesting dramatic productions of the year is *Struensee*, by Paul Meurice, one of the last surviving champions of romanticism. At the age of eighty he has produced a tragedy which for the virility of thought and beauty of its verse may well be the envy of younger men. The hero is a little Dutch physician, who has been nurtured on the tenets of Voltaire and Rousseau, and whom chance has introduced into the court of Christian VII, of Sweden, where his efforts to inculcate Rousseau's doctrines of equality eventually cost him his head. In addition to *La Reine Fiamette*, Catule Mendés has written a tragedy, *Médée*, based on the familiar classic story and much praised for the beauty of its verse. An event more interesting from a literary than a dramatic standpoint, was the production of Pierre Loti's *Judith Renaudin*, a play written in the exquisite form which we have a right to expect from the author of *Mme. Chrysanthème*, but marred by the improbability of the plot. The action takes place in the little island of Oléron, just after the revocation of the Edict of Nantes. The family of Renaudin figures prominently among the stanchest of French Huguenots and d'Estelan, the captain of dragoons, sent to compel their conversion to Catholicism, is, instead, himself converted to Protestantism by Renaudin's daughter Judith, with a promptness no less startling than the speed with which they both fall in love with each other and decide to take refuge together in Holland. The play is a good instance of what the French characterize as a *succès d'estime*. Among the plays which have met with a more hearty reception both from the public and the critics must be mentioned the *Repas du*

Lion, by François de Curel, which treats of the relation between capital and labor; *Les Mauvais Bergers*, of Octave Mirbeau, which is a dramatized history of a strike; Jules Lemaitre's charming comedy, *L'Ainée*, which deals with some of the difficulties which confront a Protestant pastor in his attempts to procure suitable husbands for a numerous family of daughters; the *Vassale*, of Jules Case, which treats of the marriage question; and *Le Berceau*, by M. Brioux, which shows some of the complications which may arise when a divorced couple meet again, by the bedside of their sick child, after the wife has remarried. *Le Calice*, by F. Vandérem, is a play of considerable force, being a psychological study of a wife who has known for years that her husband has been systematically deceiving her, and who has had the courage to conceal her knowledge. *Georgette Lemonnier* is the latest play by Maurice Donney, the author of *La Douleur*. Lastly, an event of no small interest to the dramatic world of Paris, was the election to the French Academy of Henry Lavedan, whose typically Parisian *Nouveau Jeu* had sufficed to make him famous.

FRENCH SCHOOL AT ATHENS. See ARCHÆOLOGY (paragraph Greece).

FRENCH SOUDAN includes the basins of the Upper Senegal and the Upper Niger and the region extending inland from French Guinea and from Senegal. Part of this region has been annexed and part is under protectorates. The annexed portion, chiefly on the Upper Senegal, has an area of about 54,000 square miles and a population of 360,000, and the protectorates have an estimated area of 300,000 square miles and a population of 2,500,000. This thickly populated and well-watered region promises to be the seat of an important commerce, but to the north and east it merges in the desert land of the Sahara, which is estimated to comprise some 1,500,000 square miles. A railway which was originally designed to connect Kayes on the Senegal with the Niger has been partly completed, and lately a line has been proposed from Konakry on the coast of French Guinea to the Niger. The government is carried on by a superior military commandant under the general authority of the government of Senegal. A small force of native troops is maintained.

Timbuctoo on the edge of the desert was found upon its acquisition by the French to fall far short of the expectations of wealth which had been formed of it from the early reports, but it is said that the trade has lately improved. The savage Tuaregs have been the principal obstacle to the extension of French influence over the Sahara. French activity in this portion of West Africa has had important results. In 1898 France held the most prominent place among the powers in this portion of the continent. Treaties with Liberia and Sierra Leone have fixed the French boundaries with those districts and hemmed them into the sea and the same is true of the Gold Coast and German Togoland, so that the entire region lying behind those colonies and including the upper and middle course of the Niger is held by France. At the beginning of the year 1898, however, the northern boundary of French Dahomey and the English Lagos was not fixed, and a commission was in session at Paris to settle it. From the French point of view it was important to have the town of Bussa on the Niger, for above that point the rapids make navigation difficult. It was said that the retention of this point was essential to France in order that the French Niger region might have communication with the sea. It was further urged that France had occupied that region legally by treaties with the native chiefs. For the final award of the commission on the subject see the article NIGER TERRITORIES.

FRIENDS OF THE FLORIDA SEMINOLES is the name of a recently organized society which has for its aim the improvement of the Florida Seminoles, and opposes their deportation from the State without their consent. It seeks to promote their civilization, to secure lands for their permanent homes, to establish industrial schools, and to assist them to prepare for the change that must soon come from the rapid settlement of the southern portion of the peninsula. The society will be non-partisan and non-sectarian, asking the hearty support of all lovers of humanity for a helping hand to their red brother. There will be no fees nor assessments, but voluntary contributions only. The society hopes to secure strong support throughout the State.

FRIENDS, SOCIETY OF, better known as Quakers, consists of four bodies: Orthodox, Hicksite, Wilburite, and Primitive. As to the progress made by the denomination during the year it was reported that while not many new churches were added, those already existing had increased in influence and in the number of their members, and that this growth has been especially marked in the country districts. The most interesting event of 1898 was the acquisition of a new college in Wichita, Kansas, originally the Garfield university, owned by the Disciples of Christ. It was the gift of James M. Davis of St. Louis, and was opened in the autumn as the Friends' University. The number of Friends volunteering in the Spanish-American War was very small, a matter of pride with the sect. A church edifice was acquired in Washington and they sent missionaries to Alaska and to the American Indians, as well as to foreign lands.

The American Friends joined with the English Friends in aiding the persecuted Russian Doukhobortsi (q. v.) to emigrate to the Caucasus, free from persecution. The New England Friends established a large training school for girls near Jerusalem. The Hicksites held a large conference in Richmond, Ind., when much future work was mapped out. The reports for 1898 are: Orthodox Friends, 830 churches, 1,272 ministers, and 92,073 members; the Hicksite Friends, 201 churches, 115 ministers, and 21,992 members; the Wilburite Friends, 53 churches, 38 ministers, and 4,329 members; and the Primitive Friends, 9 churches, 11 ministers, and 232 members; the total being, 1,093 churches, 1,436 ministers, and 118,626 members. According to the latest report of the commissioner of education, issued January 1, 1899, the Friends have 7 colleges in the United States, with 81 officers of instruction, 768 students and endowment funds of \$1,139,000.

Friends of the Temple, with 4 churches, 4 ministers, and 340 members, are a different body.

The Society of Friends in England consists of 16,854 members and there are 2,592 in Ireland. They have altogether in the United Kingdom 375 recorded ministers, including 149 women, and 403 meeting places.

FROST, PERCIVAL, Sc. D., F. R. S., was born at Hull, England, September 1, 1817; died June 5, 1898. He was educated at St. John's College, Cambridge; was lecturer on mathematics at Jesus College, 1847-59, and at King's College, 1860-90. He was a fellow of the last named college and formerly of St. John's. Among his published writings are: *Solid Geometry*; *Solutions of Problems in Solid Geometry*; *Treatises on the First Three Sections of Newton's Principia*; *Curve Tracing*, etc.

FRYE, WILLIAM PIERCE, Republican United States Senator from Maine, was appointed by President McKinley, August 26, 1898, one of the five commissioners to negotiate a treaty of peace with Spain. He was born at Lewiston, Maine, September 2, 1831; was graduated at Bowdoin College, 1850; was admitted to the bar; member of Maine legislature 1861, 1862, and 1867; presidential elector in 1864; mayor of Lewiston, 1866-67; Attorney-General of the State, 1867-69; member of the national Republican executive committee, 1872, 1876, and 1880, and was a delegate to the national Republican conventions of these years. In 1880 he was elected a trustee of Bowdoin; in 1881 received the degree LL. D. from Bates College, and in 1889 from Bowdoin. Upon the resignation of James G. Blaine from the Federal Senate to become Secretary of State, he was elected to fill the vacancy and took his seat March 18, 1881. In November of that year he succeeded Mr. Blaine, resigned, as chairman of the Maine Republican State committee. He was re-elected to the Senate in 1883, 1888, and 1895; in the last named year his election was unanimous with the exception of one vote. On Feb. 7, 1896, he was elected president *pro tempore* of the Senate.

FUEL GAS. See GAS.

FULLER'S EARTH. The chief use of this material at the present day is for clarifying oils, and to a lesser degree for removing the grease from cloth and fur. In 1897 the production amounted to 17,113 short tons, supplied mostly by the deposits at Quincy, Florida, and in small amounts by Colorado and New York. The material obtained in the latter State works well for fulling cloth, but not for clarifying oils. New deposits of excellent quality are reported from Ocala, Fla., and Valentine, Neb., but the extensive beds of fuller's earth in the Black Hills still remain in a comparatively undeveloped condition.

FUNGI. See BOTANY.

FURNACE. See GARBAGE and IRON AND STEEL.

GAGE, LYMAN J., Secretary of the Treasury under President McKinley, is of English descent and was born at De Ruyter, Madison county, N. Y., June 28, 1836. His parents having moved to Rome, Oneida county, when he was ten years old, he attended the Rome Academy for four years, and this was practically all the scholastic education which he received. Having acted as office boy in the Oneida Central Bank for two years, he went at the age of nineteen to Chicago where he found work in a lumber-yard and planing mill. Here he acted both as bookkeeper and as a common laborer about the yard. When serving as night watchman for this company Mr. Gage was offered a position as a bookkeeper for the Merchants' Savings, Loan, and Trust Company at a salary of \$500 a year. His rise was rapid for he was soon made paying teller, assistant-cashier, 1860, and cashier a year later. He left this position in 1868 to accept a similar one in the First National Bank. When this bank was re-organized in 1882 with a capital stock of \$3,000,000 Mr. Gage was made vice-president, and upon the retirement of S. M. Nickerson, he became president on July 1, 1891.

Mr. Gage has been a very prominent man in public affairs and in matters of finance. As chairman of the committee which was to select a site for the World's

Columbian Exposition, he worked faithfully for the choice of Chicago. It is said that much of the success of the Exposition was due to Mr. Gage; he was the first president of the Exposition Company and was president of the Bankers Section of the World's Congress. The following have been given as some of the more prominent positions that have been held by him: "Member of the clearing house committee when the Chicago Clearing House Association was first organized; an officer of the Chicago Citizens' League upon its organization in 1885; director of the Union Stockyards National Bank upon its organization in 1869; member of the executive committee of the Commercial Club of Chicago at its founding in 1885; vice-president of the Union Club in 1884; treasurer of the Young Men's Christian Association in 1878 and 1879; treasurer of the Chicago Art Institute for many years; chairman of the committee on finance for the Republican national convention of 1880; president of the Civic Federation of Chicago." See CURRENCY REFORM and UNITED STATES.

GALVIN, OWEN A., ex-United States District Attorney, died in Boston, Massachusetts, December 18, 1897. He was born in that city in 1852; having been graduated at the Boston University Law School, he was admitted to the bar in 1876, and in 1881 was elected to the State legislature. At one time he was Democratic candidate for mayor of Boston, and from 1887 to 1890 United States District Attorney.

GAMBIA, one of the West African colonies of Great Britain, is situated on the western coast of Africa at the mouth of the river Gambia, the area of the settlement proper being 69 square miles and the population in 1894, 14,978, but the total area of the country within its sphere of influence is placed at 2,700 square miles with a population of 50,000. The white population is very small, but missionary work has resulted in converting a great many of the natives to Christianity. In 1894 the population of the settlement proper included 2,385 Christians and 5,300 Mohammedans. The exports are chiefly ground nuts, hides, beeswax, rice, cotton, corn and India rubber. Unlike the other West African colonies of Great Britain its revenue has not increased since 1892 and its exports and imports have fallen off since that date, but the total tonnage of vessels entered and cleared at its ports has slightly increased in the last five years. Its chief town is Bathurst on the island of St. Mary, with a population of 6,000. The colony is important because it commands the Gambia river, which is navigable by ocean steamers. It is a crown colony governed by an administrator (R. B. Llewelyn in 1898) who is assisted by an executive and legislative council. It was first discovered by the Portuguese and was founded by the British toward the close of the 17th century. Till 1888 it formed a part of the West African Settlements, but in December of that year became an independent colony.

GARCIA Y INIGUEZ, General CALIXTO, prominent Cuban military leader, died of pneumonia at the Hotel Raleigh, Washington, D. C., December 11, 1898. At the time of his death he was at the head of a Cuban commission which after the close of the war had come to Washington to negotiate with the Federal authorities certain questions of diplomatic and financial importance. General Garcia was born at Holguin, province of Santiago, Cuba, on an October 14, but the year is disputed, being variously stated as 1836, 1838, and 1840. His family was one of excellent repute and considerable prominence, and after receiving a good education he was trained for the profession of law. Throughout his varied career he maintained an interest in intellectual and literary pursuits. His long career as a Cuban patriot began with the rebellion which broke out in 1868, known as the Ten Years' War. On October 13, of this year, three days after the Yara proclamation, Garcia with Donato del Marmol as associate leader, at the head of 150 men began the revolutionary movement in Santa Rita, Jaguani, and Baire. His action was quick and decisive and he drove the Spaniards out of town after town, including Holguin, and participated in many of the small but hard fought battles and skirmishes of that time, including the engagements of Cupeijal, Biguano, Santa Maria, and Zarzal. He rose rapidly to the rank of major-general, assuming for a time the chief command when the Provisional Government removed General Maximo Gomez. In the sixth year of the insurrection, 1873, some of the Cuban bands came to grief. Detached from his forces, General Garcia on September 3, with only twenty men was surrounded by five hundred Spaniards and though he shot himself through the mouth and head to avoid capture alive, he revived and having been transported to Spain was imprisoned in Valencia and Santona. When the peace of Zanjón was signed in 1877 General Garcia at the request of Captain-General Campos was released by Premier Canovas and he came to New York. In 1880 upon the outbreak of the six months' insurrection—"the little war"—General Garcia returned to Cuba where he fought side by side with Antonio Maceo. At Bayamo Garcia's force was compelled to surrender; again at the order of General Blanco the Spaniards showed clemency by sparing the life of the rebel chief, who was sent to Madrid where he lived for about fifteen years under police surveillance. During this time he taught young Spaniards the French and English languages.

Upon the outbreak of the last insurrection the old leader grew impatient, and

one night eluded the police and soon succeeded in reaching Paris, from which he sailed for New York on *La Champagne* in November 1895. During the following months he became famous as a filibuster. Late in 1895, with the assistance of the Cuban junta and probably aided by some rich Americans, he organized the relief expedition which came to grief with the wreck of the old and unseaworthy *J. W. Hawkins* not far from New York harbor, January 1896. Most of the men on board, including General Garcia, his son, and 120 other Cubans were rescued, but arms and ammunition costing \$200,000 were lost. General Garcia began to fit out another expedition, but was intercepted by the United States government, which arrested him on charge of violating the neutrality laws, and held him pending his trial in \$2,000 bail, which he furnished. Before the trial came, however, he succeeded in reaching Cuba on the steamer *Bermuda*. He landed with 62 Cubans at Mariel, Pinar del Rio, in March, 1896, bringing a store of weapons, provisions and money. The next month, as Commander of the Department of the East, General Garcia defeated a Spanish force under General Munez near Zarija, inflicting a loss of more than 200 killed and 400 wounded, while the Cuban loss was slight. The following June, however, Garcia was defeated twice by General Gasco, once near Venta de Cassanova and once near Bayamo, Santiago province. But in the fall he won a great victory in the capture of Guimaro with its forts; here he captured 300 Spanish officers and men, and besides a quantity of Mauser rifles, machetes, clothing, gold coin, and 200,000 rounds of ammunition. Toward the close of this year (1896) he made an attack covering many miles and lasting several days upon a Spanish convoy under command of General del Rey and bound from Manzanillo to Bayamo. The fighting was severe, and though the column succeeded in reaching its destination, it was only at a terrible loss. An event which greatly increased the prestige of the insurgents was the capture of the city of Holguin (pop. 34,700) by General Garcia in the spring of 1897. From this time on Garcia held the interior of Santiago province until the time of the Spanish-American War. In January, 1898, an important engagement occurred in which Garcia ambushed near Caiman a Spanish force under Generals Linares and Luque; the Spaniards were caught in a ravine and, it was said, more than 150 were killed.

When the American forces came to Santiago, General Garcia tendered the services of his 4,000 Cubans. The question of the efficiency of these men has been much discussed. They took part in the battle of El Caney before Santiago, July 1, 1898, and were instrumental in making it impossible for the Spanish General, Pando, to effect a union with the Spaniards in Santiago. Upon the fall of Santiago some friction arose between General Garcia and General Shafter since the latter refused to allow the Cuban leader to be present at the surrender of General Linares in any but a private capacity. Garcia thereupon withdrew his forces to a point a few miles distant, but on September 23, he decided to return to Santiago, where he was received with enthusiasm. He entertained grateful feelings toward the United States and did much to reconcile the Cubans to the temporary American occupation. Garcia, Maximo Gomez, and Antonio Maceo will probably be remembered as the three Cubans who did most for the liberation of the island. Maceo was ambushed and killed by the Spaniards—perhaps at the connivance of his surgeon-general, Dr. Maximo Zertucha—on December 4, 1898; General Gomez still lives.

General Garcia's death—occurring after Cuba was nominally liberated, but before the first fruits of the victory were realized in the Spanish evacuation of Havana, January 1, 1899,—produced profound regret and sorrow in both Cuba and America. At the funeral in Washington a detachment from Battery E, 6th U. S. Cavalry, acted as body guard by direction of Major-General Miles, and the honorary pall-bearers were Secretary Hay, Senators Proctor and Thurston, and Generals Miles, Wheeler, Lawton, Shafter, and Ludlow. The body was taken to the national cemetery at Arlington and thence transferred to Cuba by the United States despatch boat *Dolphin*, detailed for the purpose by Secretary of the Navy Long. General Garcia was a devout Catholic. He left a wife, two daughters, and two sons, one of the latter being a member of his father's staff in Cuba.

GARBAGE AND REFUSE COLLECTION AND DISPOSAL. New York, Boston and some other cities are now compelling householders and others to separate those wastes which are removed by vehicles (in contradistinction to sewage, which flows away in pipes) into three classes: (1) Garbage, or the organic wastes of the kitchen; (2) ashes; (3) a miscellaneous assortment of paper, rags, twine, excelsior, shavings, wood, rubber and leather goods, and perhaps bottles, tin cans and similar articles. The object of this separation is to facilitate final disposal and the sale of material of value. In 1898 Boston established, through a contractor, a garbage reduction plant, at which grease, ammonia and a fertilizer base are recovered from the garbage for sale. The plant was built by the New England Sanitary Product Co., under a ten-year contract which provides that the company shall receive the garbage brought to certain docks by the city, remove it in scows to the Dorchester section of

the city and there dispose of it in a sanitary manner. The company is to receive \$47,400 a year for this work, regardless of the quantity treated. On arriving at the reduction works the garbage is unloaded, shovelled into conveyors, lifted and dumped into digestors, or closed steel tanks, and cooked with steam. This dissolves the grease, which, with considerable water, is squeezed from the tankage by roller presses. The grease and water go to settling basins, where the dirt sinks to the bottom and the grease rises to the surface, leaving the water between. The grease is pumped to tanks and afterwards barreled or otherwise made ready for sale. The water remaining is evaporated to a molasses like consistency, called stick, and is added to the tankage at a later stage in the treatment of the latter. The tankage, after pressing, drops into conveyors, and after drying while passing through an enclosed Archimedeian screw, passes to ammonia ovens of the Solvay-Semet type, where commercial ammonia is produced. The coked tankage, now quite dry, is screened and prepared to serve as a base in the manufacture of fertilizers. A process similar to this, with the omission of the ammonia adjunct, is in use for the treatment of the garbage of Greater New York and of Philadelphia. Pittsburg, Buffalo, Cleveland, Cincinnati, Detroit and St. Louis also have garbage reduction plants, operating under different systems, but with the common aim of recovering grease and fertilizer. All these plants are owned and operated by private companies and no definite and reliable figures regarding their cost of construction and operation can be obtained.

A refuse sorting and waste burning plant has also been put in operation at Boston, under a ten-year contract, but with another company. While the garbage plant is remote from the centre of Boston, the refuse plant is near the business centre. Paper and other light but bulky wastes are collected and brought to the plant by the city. Here they are thrown upon a long conveyor, lined on each side by men and boys, who sort out paper of different grades, rags, wood, glass and metal. The paper, rags and twine are thrown into shutes and go to baling presses, where they are made ready for sale. No salable matter, and nothing that will not burn, passes the sorters. The final refuse on the conveyors is automatically deposited in a huge furnace and there burned. It not only forms its own fuel but generates a sufficient amount of steam to drive the conveyor and a dynamo for electric lighting. This plant has a guaranteed daily capacity of 100 cu. yds., but it is claimed that it can handle at least twice this amount. The contractor, the City Refuse Utilization Co., receives \$5,500 a year from the city, and has the use of the site of the plant free of rental, and all proceeds from the sale of the refuse.

The garbage and refuse plants at Boston dispose of all the wastes mentioned above except ashes. These being reasonably clean and sanitary can be used for filling low land, or dumped at sea.

Garbage at Boston was formerly sold to farmers and others for the ostensible purpose of feeding it to hogs. The same practice still prevails in some other places. It is considered highly objectionable, on account of breeding trichinæ in the hogs, and because there is danger that it will be fed to milch cows, as well as hogs, to the great detriment of the milk. Garbage and other wastes are often dumped at sea, or in large lakes or rivers. Unless towed a long distance, and sometimes then, this leads to the littering of the water and adjacent shores with such garbage, paper and other matter as will float.

Many cities in this country, and still more abroad, burn their garbage in furnaces. English cities have achieved the most signal success in this respect. At Shoreditch, a vestry of London, the refuse destructor, as a garbage furnace is called in England, is operated in conjunction with a municipal electric lighting plant, aiding in developing steam for the latter. The combined plant is close by a municipal bath house and public library, which shows how inoffensive garbage disposal may be when properly conducted. The Shoreditch furnaces are said to be operated without the use of any fuel save the garbage itself, which there includes more combustible waste in the form of wood-working and other manufacturing refuse, and unburned or partially burned coal, than is the case with mixed garbage in this country. The gases of combustion pass through boilers for generating steam to aid in driving the electric light dynamos. As the heaviest amount of refuse reaches the works when the least amount of electric current is required, means were provided for storing the heat from the refuse furnaces until the busy hours for the lighting plant. To this end, thermal storage tanks were built, in which hot water was to be stored during the day for the more ready conversion into steam, and thence into current, at night. Although at the close of 1898, the Shoreditch plant had been in use about 18 months the contractors had only then succeeded in making the thermal storage tanks tight and the day demand for electric current was already so heavy that it seems doubtful whether thermal storage will be of any use. In general, it may be said that the history of municipal sanitary works shows repeated instances of over-sanguine plans for the utilization of city wastes. This is true of both sewage and garbage disposal. Where the commercial feature is introduced in such plants there is always danger that the sanitary results will suffer thereby, and these should of course always be paramount.

In America, Montreal and San Francisco have garbage furnaces closely approaching some of the most successful English types, and this method of garbage disposal seems likely to be widely employed. Furnaces are now in use at Philadelphia, Pa., Atlantic City, Camden and Trenton, N. J., Lowell, Mass., New Brighton, N. Y., Atlanta, Ga., and in many other cities and towns throughout the country.

GARNIER, JEAN LOUIS CHARLES, architect, member of the French Institute, died in Paris August 4, 1898. He was born in that city November 6, 1825; studied architecture, received a first class medal at the salon of 1863; was decorated with the cross of the Legion of Honor in 1864; and became an officer in the Legion in 1875. He designed the Grand Opera House in Paris, the theatre and gambling house at Monte Carlo, the Observatory at Nice, and the exhibits at the Paris Exposition of 1889, illustrating the development of human habitations.

GARY, JAMES ALBERT, Postmaster-General in the McKinley cabinet, was born of Puritan ancestry at Uncasville, Connecticut, October 22, 1833. He accompanied his parents to Maryland in 1840, and was educated at Rockhill Institute, Md., and Allegheny College, Meadville, Pa. In 1861 he entered into partnership with his father in Baltimore in the firm of James S. Gary & Son, which owned large mills at Alberton, Maryland; and upon his father's death in 1870, Mr. Gary succeeded to the head of the business and has conducted it since. He has other valuable business interests in Baltimore and Howard counties. For a number of years he was president of the Merchants' and Manufacturers' Association and is vice-president of both the Consolidated Gas Company and the Citizens' National Bank of Baltimore. He also holds directorship in a number of well known corporations. In 1858 he was nominated as a Whig for the State Senate and was defeated. During the Civil War, Mr. Gary was ardent in his support of the Union. In 1872 he was defeated for election to Congress and in 1879 was also defeated for the governorship. He was a delegate to the national Republican conventions in 1872, 1876, 1880, 1884, 1892, and 1896; from 1880 to 1896 he represented Maryland upon the Republican national committee. On March 5, 1897, he was appointed and confirmed Postmaster-General in President McKinley's cabinet; on April 18, 1898, solely on account of ill health, he resigned this position and three days later was succeeded by Mr. Charles Emory Smith.

GAS. See SEWER GAS.

GAS, ILLUMINATING AND FUEL. Prepayment meters, incandescent burners and gas stoves and heaters rent free or for low rentals, combined with steadily lowering prices for gas, are doing much to extend the use of this modern convenience. The prepayment meters are somewhat after the fashion of penny-in-the-slot machines; a coin dropped in a slot allows the consumer to use gas until a given quantity, corresponding to the value of the coin, has been consumed. Cooking lessons are being given free of charge by many companies to popularize the use of gas for fuel. Gas lighting for trains is also being rapidly extended.

GASES, GENERAL PROPERTIES OF. See PHYSICS (paragraph Ratio of the Specific Heats of Gases and Planetary Atmospheres).

GASTRO-ENTEROLOGICAL ASSOCIATION, AMERICAN. Next annual meeting at Washington, D. C., in May, 1899. President, D. D. Stewart, M. D.; Secretary, C. D. Aaron, M. D., 32 Adams ave., West Detroit, Mich.

GAULLIEUR, HENRI, a Swiss novelist and writer on governmental subjects, died in New York City, November 20, 1898, having been in this country only a few days. He was about fifty-five years old and was born in Geneva, Switzerland, where his father was a professor of languages in the University of Geneva. Mr. Gaullieur was graduated from this institution; later he received the degree LL. D. When about twenty-two he married Mlle. Sophie de Lentulus of Berne. After a time they went to Cuba and he bought a tobacco plantation near Santiago; in a few years they returned to Switzerland and in 1869 came to America, where he engaged in the tobacco business and became wealthy. In 1881 they returned again to Switzerland, their residence at the time of his death being at Kiesen near Berne. Mr. Gaullieur was a man of broad culture; he was an amateur painter and wrote several novels in English and German, depicting American life. Among them are *Maud Dexter* and *Capt. Ralph*. His last book, which was published by Harper and Brothers, New York, a few months before his death, was entitled *The Paternal State in France and Germany*, and was widely and favorably commented on by the press in America and England.

GEISSLER TUBES. See PHYSICS (paragraph, Roentgen Rays).

GEMS. United States.—The value of precious stones produced in the United States in 1896 was \$97,850, and in 1897, \$130,675. This includes sapphire, ruby, tourmaline, quartz crystals, smoky quartz, garnet, turquoise. The turquoise came chiefly from New Mexico, but some from Nevada, while deposits are also reported from California. During 1898 there was also an important development of the turquoise indus-

try at Turquoise Mountain, Mohave Co., Ariz., where ancient Aztec workings occur. Montana and Missouri furnished sapphires, but the stones are not of the best quality. Important discoveries of quartz crystal were made in Calaveras Co., Cal. The quartz occurred in gold gravels, and some of the crystals were sufficiently large to permit the cutting of balls 8 to 14 inches in diameter.

Foreign.—New discoveries of diamonds have been made on the Rietfontein farm about 20 miles from Pretoria in the Transvaal, and the yield of the famous Kimberley mines for the year ending June 30th, 1897, was £3,722,099. The diamond, opal and emerald mines of New South Wales have been worked with favorable yield, but the lack of water has interfered with the mining operations during much of the time. Mexico and New Mexico have continued to supply much of the opal demand.

GENERAL SOCIETY OF THE WAR OF 1812, organized in 1814, composed of lineal descendants of soldiers and sailors of the War of 1812. The federated State societies have for their President-General John Cadwalader, Philadelphia, and Secretary-General, Henry Hobart Bellas, Germantown, Pa. There are 1,800 members.

GENTIANOSE. From experiments made upon growing plants E. Bourquelot shows that gentianose, the specific sugar-like substance found in the roots of various of the gentians, like the sugar found in the roots of beets, is broken up into assimilable sugars, in the course of the growth of the plant, by special ferments which are localized in the growing parts of the plant. The soluble ferments of the black moulds, *Aspergillus niger*, invertin, and other ferments act in the same way; while emulsin, saliva and diastase are without action on gentianose.

GEOGRAPHICAL SOCIETY, AMERICAN, organized in 1852 has a membership of 1,200. The objects of the society are to encourage exploration, to extend geographical knowledge, and to establish in the first port of the country a place where all engaged in commerce or navigation may obtain accurate information about any port of the globe. President, Charles P. Daly; Secretaries, Chandler Robbins, Anton A. Raven, and William Libby, Jr. The office is 11 West 29th street, New York.

GEOGRAPHIC SOCIETY, NATIONAL. See NATIONAL GEOGRAPHIC SOCIETY.

GEORGE, PRINCE, of Greece was appointed High Commissioner of the powers in Crete in November 1898. He was born in Corfu, June 12, 1869, studied in Greece and in the naval school in Copenhagen and at the age of twenty received the grade of Lieutenant in the Royal Greek Navy. While traveling in Japan with the Czarevitch in May, 1891, he saved the latter from a murderous attack by a Japanese fanatic who assaulted the Czarevitch, but before he could renew his attack was struck down by Prince George. Later in 1891 Prince George visited the United States. During the Græco-Turkish War he commanded the Greek navy which, however, did not accomplish what was expected of it. His appointment as High Commissioner in Crete was received with favor by the natives as well as by the Greeks. See CRETE.

GEOLOGICAL SOCIETY OF AMERICA, founded in 1888, has 238 fellows. President, J. J. Stevenson, New York University; Secretary, H. L. Fairchild, University of Rochester.

GEOGRAPHICAL SURVEYS. A most notable and commendable feature in the works of the various State and Government geological surveys during 1898 has been the increased attention given to economic work, without neglecting entirely at the same time purely scientific investigations. The United States Geological Survey, has issued a number of special bulletins, atlas folios and monographs during 1898, in addition to the annual report of the director, which in the case of the eighteenth, recently published, consists of five large volumes. The work of the State surveys can perhaps best be judged from a mention of the more important papers contained in the reports issued in 1898, thus: Maryland, Reports on the Cartography of Maryland, and Building Stones; Indiana, Petroleum, Clays and County Reports; Iowa, Building Stones and County Reports; North Carolina, Gold Ores, and Clay Deposits; Georgia, Water Powers, Phosphates and Marls, and Gold Ores; New Jersey, Final Report on Physiography of the State; New York, County Reports and Palaeontological Monographs. The Canadian Geological Survey has issued its report for 1895 during the past year.

GEOLOGY. One of the greatest difficulties which geologists have had to contend with has been the attainment of uniformity in the naming, classifying and mapping of geological facts, and twenty years ago, this was brought up, as one of the purposes aimed at by the international congress of geologists. An insurmountable difficulty has been the correlation of European and American formations, it being found hard even to correlate the different European areas. In the U. S. alone, investigations have shown that the formations of each one of the great geological systems present such great diversity in their physical features, and in the particular composition of their faunas, that two, three, or four classifications are sometimes needed to present the true facts. Uniformity is probably only practicable in respect to the grander divisions, and diversity

is probably both practicable and necessary for naming the smaller ones. A recent commission of American and foreign geologists appointed for the purpose of discussing the question of nomenclature came to the conclusion that it was useless to attempt to preserve a rigid system of naming, and adopted a principle of elasticity in all matters of detail. They decided that units of the second order are the smallest division of the geological scale to which uniform name and position can be given in an international scheme of classification. They also adopted a set of prefixes (such as *paleo*, *meso*, *neo*), to be attached to the name of the system, as a method of reaching comparative uniformity in the naming of divisions of the third order. The local geologist is to select local geographic names, for divisions of the fourth order.

Physical.—The theory of Dana that all coral atolls have been formed on sinking land areas has been usually accepted, but during the past year Murray's hypothesis that in some cases at least atolls may form on rising land has received corroboration by the discovery that Christmas Island south of Java consists of a base of basaltic rock, capped by foraminiferal limestone which is a deposit formed in water far too deep for coral animals to live in. On this limestone is a mass of coral rock having the circular, rim-like form of an atoll with the central depression. This could only have been formed on the limestone after it had been raised to near the ocean level. A second elevation, or continuation of the first one has elevated the coral rock above the water, and a sea beach has been formed on the foraminiferal limestone. Recent work in the Fiji Islands by Prof. Agassiz is tending to further strengthen Murray's theory.

It has been found that the streams of the lower Mohawk Valley of New York State and the corresponding valley to the westward were, in preglacial times, tributaries of the Hudson and St. Lawrence rivers respectively, but glacial and aqueo-glacial erosion at Little Falls removed the divide and united the two. During recent geologic times temporary lakes also existed both east and west of Little Falls, being held in by barriers of ice or glacial drift. One important feature of the changes in topography produced by erosive action and grading by deposition in the valley during glacial and postglacial times was to make the region through central New York a natural thoroughfare of inestimable value commercially.

Recently completed observations of levels carried on over a period of 20 to 30 years in the region around the Great Lakes indicate that this region is being lifted on the North and depressed on the South, the actual direction of the tilting being south-southwest and such that the two ends of a line 100 miles long are relatively displaced four tenths of a foot in 100 years. If this movement continues, then, in 500 years Lake Michigan will overflow at Chicago during highwater stage, in 1,000 years the Great Lakes will discharge continuously both at Niagara and Chicago, and in 2,500 years Niagara will have ceased to exist.

Among the text-books dealing with this branch of science issued during 1898 are Davis's *Elementary Physical Geography*; Russell's *Rivers of North America* and *Volcanoes of North America*. R. S. Tarr in the *American Geographic Magazine* gives an important series of papers on the physical geography of New York State.

Petrography.—A memoir on the granite massifs of the Pyrenees by A. Lacoix deals with the peculiar and extensive contact metamorphism which has occurred in that region, and another work on the igneous rocks of Tasmania by Twelvetrees and Petterd gives an account of a hitherto little known region.

H. S. Washington has described the occurrence of *sölvbergite*, and *tinguaite* from Essex Co., Mass., which are of interest as forming a parallel series of rocks to those of the celebrated Christiania region of Norway. The Judith Mountains of Montana has been found to be of a laccolithic character, and the intrusions show acid feldspathic rocks of several different types, whose granularity of structure depends upon their chemical composition, and not on the depth at which they have been intruded. Six principal laccoliths have been found. Iddings suggests the term *Bysmalith* to denote a more or less cylindrical, or plug-shaped mass of igneous rocks, which has been pushed upwards from below. Mt. Holmes of the Gallatin mountains in the Yellowstone Park is an example of this. The occurrence of dikes of igneous rocks in the central and northern Appalachians is very unusual, for detailed work in various portions from Alabama to New York, has only resulted in the discovery of one in central Pennsylvania, and a small group west of Staunton, Va. Those found in Virginia have been added to by recent discoveries of some additional ones in Pendleton Co., West Virginia. F. L. Ransome has described a series of lava flows on the western slope of the middle Sierra Nevada, where in tertiary time no less than six successive volcanic beds were laid down. Between the flows, erosion took place resulting in the deposition of auriferous gravels. One of these streams flowed down a previously formed valley for a distance of sixty miles.

Among new text-books may be mentioned *Elemente der Gesteinslehre* by Prof. Rosenbusch.

Palaeontology.—A most important discovery has been the noting by Walcott of the

occurrence of well marked fossils from a horizon 4,000 ft. below the Cambrian beds in Montana. The remains are crustacean segments, related to the *Eurypterus* of the Upper Silurian, and are by far the earliest organic remains known. A monograph on the fossil *Medusae* or jelly fishes, also by Walcott, shows that in spite of the delicate structure of these animals, a surprisingly large number of fossils are found, but all those found in the United States belong to the Cambrian. C. R. Eastman's work on the Devonian fishes of Iowa, shows the presence of a highly interesting assemblage of forms, including several new genera, and by their occurrence bringing forth some interesting relations of palaeozoic problems. A study of the Devonian fauna at Naples, N. Y., shows that its characters bring it into close relationship with certain faunas of the same age in Devon, Eng., Belgium, the Rhine and Hartz districts in Germany, and the eastern and western slope of the Urals.

Foreign.—Data collected by the Jackson-Harmsworth expedition to Franz Josefs Land show the presence of deposits of the Jurassic age, whose interest lies in the fact that in the same beds are found ammonite and plant remains, showing that in Jurassic times a shore line existed in that region. Vast flows of basaltic lava subsequently covered up the soft Jurassic sediments and thereby protected them from erosion.

GEORGIA, a southern State of the United States with an area of 59,475 sq. m. Capital, Atlanta.

Mineralogy.—The great impetus that was given to gold-mining in Georgia by the incorporation of the British-Georgia Gold Mining Company, capitalized at \$5,000,000, was seriously checked in October, 1897, by the sudden return to England of the resident manager and the closing of the company's offices at Gainesville. Much consolation, however, was derived from the report of P. L. Noble, an experienced Denver miner, in January, 1898, which pronounced the gold fields of Georgia not only exceedingly rich but practically inexhaustible. Mr. Noble stated that the mineral belt runs diagonally across Alabama, Georgia, and North Carolina. Recently careful investigations have been made by the Georgia Geological Survey and by Mr. Becker of the United States Survey, and it seemed to be the opinion of geologists that there was no great gold-bearing reef or vein as in the case of Mother Lode of California. Georgia and Alabama are the only States in the country now producing bauxite, the raw material for aluminum, and in both States the industry is undergoing rapid development. The yield in both States in 1896 was 18,364 long tons and in 1897, 20,590. Alabama leads Georgia by about 4,000 tons, but Georgia has more than doubled her yield in three years, while Alabama's has fallen off.

Agriculture.—Official reports in 1898 indicated a general betterment in agricultural interests. The State held third rank as a cotton producer, with a crop of 1,350,781 bales, valued at \$38,272,680. Other leading crops and values were, corn, 26,586,648 bushels, value, \$12,761,591; wheat, 2,607,360, \$2,555,215; oats, 7,196,449, \$3,454,296; potatoes, 305,154, \$228,860; rye, 133,096, \$130,434; and hay, 199,222 tons, \$2,340,858—total value, \$21,471,260. While cotton and corn continued to be the most valuable crops, much more attention than formerly was being paid to the side branches of farming, especially in the line of products needed for home consumption. Live-stock comprised, horses, 110,266; mules, 158,594; milch cows, 297,324; other cattle, 423,018; sheep, 327,584; and swine, 2,093,987—total head, 3,410,773.

Manufactures.—In February 1898, the leading manufacturers of the State held a convention in Atlanta and organized a permanent association to promote a general industrial advancement. It was decided to seek a constitutional amendment giving to cities and towns the right to exempt manufacturing enterprises from municipal taxation by popular vote. There were 77 cotton and woolen mills, in the State, which in 1897-8 bought 285,219 bales of cotton for their own consumption, and several others were under construction or projected. The mill purchases of cotton were 25 per cent. larger than in the previous year. From 1890 till 1898 the number of spindles increased from 469,468 to 765,142. A scheme of much promise was developed early in the year, involving the creation of a high water power for electrical transmission by means of three dams in the Chattahoochie river, within a distance of sixteen miles.

Commerce.—During the fiscal year ending June 30, 1898, the imports of merchandise at the ports of Brunswick, St. Mary's, and Savannah aggregated in value \$423,264, and the exports, \$39,577,014, an increase in total trade in a year of \$8,693,777. The share of Savannah was, imports, \$391,634; exports, \$28,938,166.

Railroads.—The assessed valuation of railroad property in the State in 1898 was \$43,036,457. Governor Atkinson has urged on the legislature an enlargement of the powers of the State Railroad Commission, suggesting among other things that the Commission be given authority over street railroads and telephone companies, that it have control of the issuance of stocks and bonds of railroads, that it have speedier methods of enforcing its orders to compel railroads to accord immediately to the public rights which are due, and that it have power to regulate freighting and to prevent discriminations.

Education.—At the close of the school-year 1896-7 there were 715,300 persons of school age in the State, of whom 446,171 were enrolled in the public schools, and 246,683 were in daily attendance. The percentage of enrollment by races was, white, 58.62; colored 50.33. Public school property was valued at \$2,725,369, and the expenditures were \$1,765,972, including \$1,534,020 for teachers' salaries. There were 100 public high schools with 217 teachers and 4,652 pupils, and 85 private secondary schools with 245 teachers and 4,174 pupils; 2 public and 6 private normal schools; 11 colleges and universities, co-educational and for men only; 12 colleges and seminaries exclusively for women; and 2 theological, 3 law, and 4 medical schools. The State College of Agriculture and Mechanical Arts at Athens, endowed by Congress, received from the Federal government \$22,000 in 1897 and \$23,000 in 1898. In the last year there were 357 periodicals, of which 28 were dailies, 273 weeklies, and 43 monthlies. Two schools modelled after Booker Washington's school at Tuskegee, Ala., have been established in Georgia. One is the Fort Valley Industrial School and is in a flourishing condition. It has an attendance of nearly 500 students, a full corps of teachers, comfortable buildings and a very fair mechanical equipment. It is open to colored students of both sexes. The boys are trained to be carpenters, bricklayers, blacksmiths, plasterers, etc., and receive instruction in scientific farming. The girls learn dress-making, cooking, fancy needle-work, telegraphy, stenography, millinery, typewriting, etc. There is a State grant of \$1,500 a year and the negroes have promised to raise \$3,000 more this year. The county also makes an annual appropriation for the school. A similar school has been opened at Greensboro with every prospect of success.

Banks.—On October 31, 1898, there were 29 national banks in operation and 15 in liquidation. The active capital aggregated \$3,916,000; circulation, \$1,311,341; deposits \$7,418,245; and reserve \$2,152,150. The State banks, May 5, 1898, numbered 119, and had capital \$9,146,842; deposits \$17,530,380; and resources \$32,792,829. The exchanges at the United States clearing houses at Macon, Savannah, and Atlanta, in the year ending September 30, 1898, amounted to \$223,950,348, an increase of \$4,997,224 in a year. At the close of 1897 the legislature provided for the appointment of a State Bank Commission and also passed a bill authorizing the State banks to issue circulating notes and empowering the Governor to take legal action to prevent the collection of taxes from these banks under Federal laws.

Finances.—The recognized bonded debt, October 1, 1898, was \$8,039,000, besides a floating debt of \$90,202—total \$8,129,202; contingent liabilities, \$464,000; total assessed valuations \$409,357,449; State tax rate \$6.21 per \$1,000.

Population.—As estimated by Federal officials, the population on June 30, 1898, was about 2,235,000. The local estimate for Savannah was 65,000.

Legislation.—An act was passed giving authority to State banks to issue their obligations payable in silver bullion, said obligations not to be similar in appearance to national bank notes or Federal currency, and not to be issued to an amount greater than 50 per cent. of the fully paid up, unimpaired capital stock of the bank issuing the same. Private bankers are made subject to examination by the State Bank Examiners, and are required to make reports such as are now required of incorporated banks. They must also have the words "Not incorporated" stamped upon their stationery, letter heads, and envelopes. The franchises of an insolvent corporation are declared to be assets, which may be sold, under the order of the court, through a receiver or otherwise. All building and loan associations incorporated under the laws of the State must deposit with one of the legally authorized State depositories, or trust companies, 75 per cent. of the amount of all mortgages or other securities received by them in the usual course of business. Regulations are made for mutual insurance companies formed to insure against loss or damage arising from burglary, robbery, or attempt thereat, and to insure against the loss of money or securities in course of transportation by registered mail. All life insurance companies doing business on the assessment plan must print on every policy or benefit certificate the words, "This contract is issued upon the assessment plan;" and also the words "Assessment plan" upon every application, circular card, advertisement, and other printed document. Companies organized for the purpose of generating electricity for lighting towns or cities, or for supplying motive power to railroads or street car lines, or supplying light, heat, or power to the public, receive the right to purchase, lease, or condemn rights of way or other easements necessary for such purposes, upon the lands of others, upon first paying just compensation to the owners of said lands. It is made a misdemeanor to injure or destroy the wires, meters, or other apparatus of electrical companies, or to divert any electrical current from the wires, or without the consent of the company, to use any electricity manufactured or distributed by such company.

Law Relating to the Treatment of Convicts.—A law came into operation amending the treatment of convicts. Under the old law governing misdemeanant convicts, in some counties unauthorized leases fostered abuses and sometimes cruelty, but the new act puts an end to this. The complete management and control of the State convicts

is intrusted to a Police Commission of three members. Able-bodied male convicts are still to be hired out; all others are to be kept in prisons and stockades and on farms to be procured and directly controlled by the Commission. Under the old system Georgia received \$25,000 a year for her convicts and it is expected that this new law will raise this to \$75,000 or \$100,000. There are about two thousand convicts all told. The new commissioners are doing their work so well that it is expected that there will be no future charges of cruelty. The convict-laborers are under the care of guards appointed by the commissioners. The commission also constitutes a board of pardons that must investigate all applications for executive clemency and make recommendations to the Governor as to granting the same.

The Library Commission.—A State Library Commission of five members was also appointed. It must give advice and counsel to all libraries in the State, and to all communities that purpose establishing them, as to the best means of establishing and administering such libraries, selecting books, cataloguing, and other details of library management. The Commission must make biennial reports to the Governor. No member of the Commission is to receive any pay or travelling expenses, nor is the State to pay any expense incurred by the Commission for services or travelling.

Admission to the Bar.—Oral examination for admission to the bar ceased on Aug. 1; in future all candidates must undergo a written examination prepared by the Supreme Court, which shall also fix the dates in each year when the examinations are to be held. The examinations are to be supervised by the judges of the Superior Courts under rules adopted by the Supreme Court, and are to be forwarded to the Supreme Court which shall pass upon the merits of said examinations and upon the admission of the candidates. The latter are to sign the examinations by numbers, so that the name of each candidate may not be known until after his admission or rejection. This act does not apply to graduates of duly authorized law schools, nor to those who have been admitted to the practice of the law in other States which by comity admit to practice the duly licensed lawyers of this State.

Law Relating to Land Titles.—An act was passed for the relief of *bona fide* settlers and others possessed of defective title. In actions for recovery of lands *bona fide* held under adverse claim of title, in case title is found to be in the plaintiff, the defendant is permitted to set off the value of the permanent improvements *bona fide* placed thereon and to recover a verdict therefor in excess of the mesne profits.

The Tax on State Bank Notes.—Georgia has also devised a plan to test again the constitutionality of the national 10 per cent. tax on State bank notes. A commission has been established with power to issue circulating notes to any bank. If an attempt is made to levy the ten per cent. tax, the Attorney-General is required to carry the case to the U. S. Supreme Court.

The Boundary Question.—Much excitement was manifested regarding the Georgia Boundary Question. The Attorney of the State Mr. Wimbish filed his report with Governor Candler on Georgia's claim to 1,500 square miles of territory lying in Tennessee and North Carolina, and therefore Chattanooga (q. v.), according to this claim, belongs to Georgia.

Shaker Colonies.—The Shakers, who have large colonies throughout the United States, purchased Altama and Hopeton plantations in Glynn county after twelve months of investigation in the Southern States. It is thought to be the beginning of a movement whereby the entire Shaker colony will concentrate in Georgia. Another purchase of 51,000 acres in Charlton, Pierce, and Ware counties was made.

Representatives and State Officers.—Georgia's eleven representatives to Congress are: Rufus E. Lester, from Savannah, James M. Griggs, from Dawson, E. B. Lewis, from Montezuma, W. C. Adamson, from Carrollton, L. F. Livingston, from Kings, C. L. Bartlett, from Macon, J. W. Maddox, from Rome, W. M. Howard, from Lexington, F. C. Tate, from Jasper, W. H. Fleming, from Augusta, and William G. Brantley, from Brunswick. Augustus O. Bacon (Dem.), from Macon, and Alexander S. Clay, from Marietta (Dem.), are the Senators. The officials are: Allen D. Candler, Governor; Philip Cook, Secretary; W. I. Speer, Treasurer; W. A. Wright, Comptroller; P. G. Boyd, Adjutant-General; J. M. Terrell, Attorney-General; G. R. Glenn, Superintendent of Education; and O. B. Stevens, Commissioner of Agriculture. All are Democrats. Chief Justice, Thomas J. Simmons; Associates, Samuel Lampkin, Henry T. Lewis, Andrew J. Cobb, William A. Little and William H. Fish; and Clerk, Z. D. Harrison. There are 213 Democrats, 1 Republican, and 5 Populists in the State legislature.

GERMAN ARCHÆOLOGICAL INSTITUTE. See ARCHÆOLOGY (paragraph Greece).

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. In 1898 this religious sect devoted its attention to strengthening and developing its existing congregations and institutions rather than extending its branches. The General Conference met at Quincy, Ill., in September, and selected Dr. Paul L. Menzel of Richmond.

Va., to represent the Evangelical Synod at the dedication of the Evangelical Church in Jerusalem, Oct. 31, 1898; the constitution was partially resolved; a board for home missions was established; the publication of a hymn-book in the English language was authorized; and resolutions were passed regarding the enlargement of its publishing-house, and the celebration of the semi-centennial of its theological seminary, Eden College, July 4, 1900. The year's record shows 872 ministers, 1,130 churches, and 199,234 members.

GERMAN LITERATURE. History.—If we accept the numerous biographies and memoirs which have historic interest there were comparatively few volumes of history published in the year 1898 which possess any great importance. A curious work, of unusual erudition, and one which belongs quite as much to the department of philosophy as of history, is Prof. P. Barth's *Die Philosophie der Geschichte als Sociologie*. The author's aim is to show that the evolution and the various phases of society are the true objects of history. Two important works that bear upon the history of mediaeval Rome are *Geschichte Roms und der Päpste im Mittelalter*, by Prof. Hartmann Grisar of Insbrück, the first volume of which has just appeared; and Prof. Otto Seeck's *Geschichte des Untergangs der antiken Welt*, which has been in the course of publication since 1897. Prof. Seeck claims that the Emperor Constantine, usually somewhat disparagingly treated by historians, really did deserve the epithet "Great" bestowed upon him by the Christians. Other volumes dealing with Mediaeval history are H. Frankfurth's *Gregorius de Montelongo*, described as "a contribution to the history of Upper Italy in the years 1238-69;" *Papst Silvesters II. Einfluss auf die Politik Kaiser Ottos III.*, by C. Lux; and *Zur Geschichte Polens im Mittelalter*, by Max Gumpowicz. Worthy of mention also are R. Werner's *Bilder aus der Deutschen Seekriegsgeschichte von Germanicus bis Kaiser Wilhelm II.*; the second part of H. Friedjung's *Der Kampf um die Vorherrschaft in Deutschland, 1859-66*; and the initial volume of H. Kraemer's *Das XIX Jahrhundert im Wort und Bild: Politische und Kulturgeschichte*. A work of uncommon interest, for its bearing upon the Franco-Prussian War, is *Pariser Gedächtnisblätter*, consisting of the diary of Wilhelm Cahn, who as attaché of the Swiss embassy, was in Paris throughout the war, the siege and the succeeding days of the Commune. A curious volume is the "Jubilee-edition for the German People," of Hans Blum's *Die Deutsche Revolution von 1848-49*, containing a large collection of contemporary caricatures, pamphlets, and manifestoes.

Biography.—The year 1898 has a two-fold historical interest, as the jubilee year of the Revolution of 1848, and as the year of the death of Prince Bismarck; and each of these circumstances has called forth a number of memoirs and biographies of considerable historical importance. To the former category belong two works which treat the events of that troubled period from diametrically opposite standpoints; *Erinnerungen eines Achtundvierzigers*, by Stephan Born, a companion of Engel and of Marx, and one of the first champions of the German socialists; and *Aus Meinem Leben*, by Prince Kraft zu Hohenlohe-Ingelfingen, known not only as Adjutant-General of Emperor William I, and commander of the Artillery during the siege of Paris, but also as author of *Militärische Briefe* and numerous other technical works on the art of war. Of the great mass of Bismarck literature which has appeared during the last few years, the first place must necessarily be conceded to Bismarck's own *Gedanken und Erinnerungen*, published simultaneously in German, French and English. Of scarcely less interest, however, are the recent Bismarck Memoirs by Dr. Moritz Busch, although these belong to the domain of politics rather than of literature. (See article BISMARCK.) The three principal biographers of Bismarck, however, are Ludwig Hahn, Heinrich von Poschinger and Horst Kohl, author of the *Bismarck-Regesten*, (Leipzig, 1892), and since 1894, of an annual *Bismarck Jahrbuch*. Bismarck's *Politischen Reden*, edited by Kohl in twelve volumes, have recently been issued in a popular edition, in the well-known Universal-Bibliothek. In addition to publishing Bismarck's correspondence, Von Poschinger is author of such important works as *Fürst Bismarck und die Parlamentarier*, (Breslau, 1894-96), and *Fürst Bismarck's Ansprachen; 1848-94*, (Stuttgart, 1894), besides a series of *Tischgespräche* and an annual *Bismarck-Portfeuille*. Works belonging to the last months of 1898 are the sixth, seventh and eighth volumes of Johannes Penzler's vast work *Fürst Bismarck nach seiner Entlassung*; a supplemental volume by Blum, bringing his *Fürst Bismarck und seine Zeit* down to the time of his death; and Horst Kohl's *Denkwürdige Tage aus dem Leben des Fürsten Bismarcks*. Among other important works relating to Bismarck it was announced that the following would be ready for publication early in 1899: Von Poschinger's *Neue Tischgespräche und Interviews; Bismarck Posthumus*, by Ludwig Bamberger; *Bismarck's Humor, Heiteres aus dem Leben und Wirken des Altreichskanzlers*, by Alfred Gottwald; and lastly *Bismarck in der Caricatur*, a collection by R. Walther, of upward of 230 caricatures from French, English, Russian, Italian, American and German sources. Von Poschinger also published last year a life of *Kaiser Friedrich; in neuer Quellenmässiger Darstellung*.

GERMAN SOUTHWEST AFRICA is a German protectorate on the African coast between Portuguese Angola on the north and Cape Colony on the south. The estimated area is 322,450 square miles and the population about 200,000 of whom 2,628 in 1897 were whites. The British possessions of Cape Colony and South Africa shut it off from the interior but a narrow strip extends along the southern boundary of Angola as far as the junction of the Chobe and Zambesi rivers. Its coast stretches for 330 miles from the Cunene river to Orange river, but is broken for a short distance by Walfisch bay which belongs to Great Britain. Its climate and physical features are sub-tropical, although two-thirds of the land lie in the tropic zone. The temperature is moderate except in a few parts of the colony and the air of the fertile upland plains is singularly dry and bracing. The days are hot but during the night frost frequently occurs. The rainy season occurs in December and January. The streams are nearly dry in summer but there are said to be good facilities for irrigation. Most of the native inhabitants belong to the Hottentot, Bantu and Damara races. The principal settlements are Windhoek, Gobabis, Otjimbingue, Gibeon, etc. Walfisch bay, belonging to Great Britain, is by far the best harbor on the coast, but the Germans possess Sandwich harbor, Lüderitz bay and the new harbor of Swakopmund which is connected by railway with Windhoek. The seat of government is Great Windhoek in the interior about 180 miles east of Walfisch bay. In spite of its natural advantages the agriculture of the colony has not been developed, the natives not having advanced beyond the pastoral stage. Large numbers of cattle, sheep and goats are raised, especially in Damaraland. Gold, copper, and other minerals have been found. The government is a protectorate under an imperial commissioner.

The history of the colony affords a good illustration of the slowness of the Germans to appreciate the value of African possessions. It was purchased in 1883 by Herr von Lüderitz and in the following year placed under imperial protection. The unattractive aspect of the coast with its shifting sand dunes gave the impression that the land was worthless. Access to the interior could be had with difficulty for the British possessed the only good harbor of Walfisch bay. In spite of all this Lüderitz believed that the interior contained valuable lands and that an export trade might be developed in ivory, ostrich feathers, guns, skins, and horns, for it was known that these products had been obtained from this region in previous years. He died, however, before he had a chance of verifying his surmises. The German government, doubtful of the value of these lands, hesitated to purchase them from his heirs and accepted the offer of a syndicate formed in 1885. This syndicate managed the province badly and it is said that as late as 1890 Count Caprivi was ready to cede it to Great Britain. But gradually the public opinion was interested in the colony and the belief in its value gained ground. In the meanwhile, however, the government had made concessions to English companies to the disadvantage of the Germans. During the last few years the colony has progressed. Its governor, Major Lutwein, has tried to promote immigration as well as to stimulate domestic trade. The farms are not carefully tilled but are rather of the nature of ranches. The great obstacle to economic progress has been the rinderpest which, however, seems to be under control. The development of the colony is said to be hindered by the bureaucratic spirit of the government. A German writer in 1898 (F. Bley, formerly governor of German East Africa) complained of the policy of excluding the Boers from the country. He considers these people the most desirable of immigrants, being "industrious, temperate, tough in body, and above all experienced particularly in just those things which pertain to South African farming and cattle raising." He says, "The struggle between the Dutch and English in South Africa would be accelerated to an end if a power like Germany afforded open aid to the Dutch. At present the Boers wish to become neither German nor English but they will be unable to resist subjection in the long run of time; and as natural affinity will draw them ultimately to the lap of Germany, the better it will be for the Germans, the more widespread and prosperous they have become. The government ought to leave no stone unturned to encourage its subjects to try to extend and appreciate the peculiar ways and opinions of the Boers. The future of the white race in Africa depends upon the rapidity with which a mutual understanding between the two Teutonic branches of it can be developed. The German government may be brought to perceive this and to let minor political consideration drop into abeyance in order to adjust its policy in accordance with the one great question at stake. But at present its task appears to be to seek colonial aggrandizement *per se*; it is even emulating Great Britain in encouraging colonial commerce, all of which is a great step in advance beyond its former indifference to matters colonial. The final comprehensive grasp of the subject of African colonization, however, from the point of view of the political future is still wanting. At least no evidences of such grasp of the subject are visible as yet to men working in Africa."

GERMANY occupies the central portion of Europe and consists of 58 states with an area of 208,830 sq. m. (including Alsace Lorraine), with a population on December 2, 1895, of 52,279,915.

Natural Products.—Germany has great mineral resources, especially in Prussia, where the larger part of her mineral wealth is produced. The minerals include coal, lignite, iron ore, zinc ore, potassic salt, rock salt, lead ore, copper ore, etc. The vegetable products are also various and abundant. All the ordinary cereals are extensively cultivated and besides these, hemp and flax, madder, wool, saffron, tobacco, hops and a variety of vegetables and fruits are raised. According to the figures for 1896-97, the chief cereal crops were rye, oats, wheat and barley and of other natural products, potatoes, hay, beet root and wine were the most important. As to the acreage under the principal crops the largest in 1896-97 was devoted to the raising of rye and next came hay, oats, potatoes, wheat and barley. Great efforts are made to encourage agriculture in all the states.

Manufactures.—Germany has made great progress in the industrial arts, especially during the last twenty years, and this has been attributed in part to the encouragement and direction afforded by the Imperial and State governments. Among the chief industries may be mentioned the mining of coal, the manufacture of coke, pig iron, steel billets, machinery, seed oils, potash salts and the linen and woollen industries. The consumption of coal, which is to some extent an index to the condition of manufactures, has steadily advanced, and though the domestic supply has increased, it has not been sufficient for the great increase in demand and Germany imports a considerable quantity of coal from abroad. A review of the condition of German industries published in 1898 draws attention to the continued prosperity and activity in all fields of German industry during the previous year. The number of industrial companies organized in 1896 was 182, while in 1897, 254 were formed with an aggregate capital of \$90,551,860, an increase of nearly a third over the capital of the companies organized in the previous year. Efforts have been made to improve German manufactures of machinery and with success, although American machinery is still extensively used in Germany. In the iron and steel manufactures Germany is one of the leading countries of the world and in the manufacture of beet root sugar it stands at the head of European nations.

As to industrial conditions in the year 1898, no official figures were available at the close of the year, but the following statements are of interest: The railway freight traffic increased, having risen steadily from 151,000,000 tons in 1890 to 218,000,000 tons in 1898. In Prussia the state railways yielded an increase of about 50,000,000 marks. There was also an expansion in the money market in 1898, the loans floated amounting to 1,532,000,000 marks compared with 695,000,000 marks in 1890. The centralization of industry has also continued. The extent to which small industrial concerns were transformed into companies is illustrated by the great value of the shares issued in 1898. It was reported that the number of large retail stores in Germany had vastly increased. These establishments seem to have been modelled on those in the United States and to have aroused something of the same kind of opposition there as here. In some of the German cities the governments have discriminated against these department stores as for instance in Dresden, where a local law taxes stores whose annual sales exceed a certain amount and in the Prussian Diet it was announced that a bill would be presented by the government imposing a special tax upon these large establishments, which are known in Germany as *warenhäuser*.

Commerce.—The principal exports of Germany are textiles, metal and metal wares, "articles of consumption," chemicals and drugs, leather goods, machinery, etc. In 1896-97 the total exports of sugar from Germany reached the extraordinary figure of 2,616,776,425 pounds, of which nearly one-half went to England. In 1896 the leading countries to which Germany exported goods were, in the order of their importance, Great Britain, Austria-Hungary, the United States, Russia, the Netherlands, Switzerland, France and Algeria, and Belgium, and the leading countries from which she imported goods were, in the order of their importance, Great Britain, Russia, the United States, Austria-Hungary, France and Algeria, Belgium, the Netherlands and Switzerland. In that year there was a considerable increase both in imports and exports over the previous year. Recently Germany has attained in commercial and industrial importance a place second only to Great Britain among European nations. According to the statistics published in the United States Consular Reports, at the close of the year 1898, it appears that the officially estimated figures for the foreign trade of the five years ending with 1897 showed great increase in both exports and imports since the year 1893. In 1897 the increase over the total foreign trade of 1896 was estimated at \$93,000,000, the imports for 1897 being \$1,150,228,058, and the exports \$906,335,178. For many years there has been an annual excess of imports over exports amounting in 1897 to nearly \$243,000,000. This is due to the fact that Germany with her large population cannot raise meats or bread-stuffs in sufficient quantities for home consumption, and it is these articles together with several staple raw

materials that swell the value of her imports. As to the trade with the United States, the most noteworthy articles of import into Germany from this country were raw cotton, corn, copper, petroleum, meats, hides and skins, oil cake, lumber and timber, rye and barley. There was a considerable decrease of the exports from Germany to the United States, owing it is said to the United States' tariff law of 1897. This loss fell heavily upon the districts of the textile manufactures, Crefeld, Barmen, Sonneberg and Aix-la-Chapelle. This decrease attracted considerable attention in Germany, where, in some quarters a resort to a retaliatory policy was favored. (See the articles UNITED STATES and TARIFF.) In 1897 the importation of Indian corn from the United States increased about 76 per cent., owing in part to the growing tendency to use corn as a bread-stuff as well as for fodder and for distillation. The importation of wheat on the other hand declined considerably in 1897 as compared with the previous year. The importation of leather from the United States has also shown a steady growth in recent years in spite of the tendency of the Germans to adopt American methods and equip their plants with American machinery. Fresh fruit is another item which the Germans have been importing in increasing quantities from the United States but its importation was checked in 1898 by the restrictive policy of the German government in respect to this class of products. (See the article TARIFF.) Testimony to the extraordinary development of German enterprise was afforded by a report published by the British foreign office, dealing with the history of the German trade and shipping from 1872 to 1897. Within this period it was said that Germany's foreign trade had increased 60 per cent. and that her merchant marine had more than kept pace with it, having trebled since 1871. In coasting trade as well as in ocean traffic there was an enormous increase. The facilities supplied for technical and commercial education were highly praised as resulting in the greater skill and efficiency of those engaging in these occupations. Official figures for the foreign trade of the Empire during the year 1898 were not available at the close of that year, but on the basis of estimates it was said that the export trade of the Empire, in spite of the falling off in the exports to American countries, had increased in 1898 as compared with 1897. For a brief account of the commerce of Germany with South American countries, see the article SOUTH AMERICA.

German Coal Trade.—Imports and exports of fuel in Germany for the calendar year 1898 were as follows in metric tons:

	Imports.		Exports.	
	1897.	1898.	1897.	1898.
Coal	6,072,029	5,820,332	12,389,907	13,989,223
Lignite	8,111,076	8,450,149	19,112	22,155
Coke	435,161	332,578	2,161,885	2,133,179
Briquettes	79,450	62,239	247,722	325,408

This shows a surplus of exports over imports in 1898 of 8,168,891 tons of coal, 1,800,601 tons of coke, and 263,169 tons of briquettes; an excess of imports of 8,427,994 tons of brown coal, or lignite.

Foreign Trade Policy.—German political opinion is divided upon the question of foreign trade policy. The Agrarians favor the establishment of a strict protective policy in regard to meats and cereals and would put an end to the concessions guaranteed by commercial treaties. The industrial group on the other hand favor the lowering or abolition of the duties upon foreign meats and bread-stuffs in order to lower the cost of production in manufactures; and the commercial group advocate free trade and the extension in every possible way of foreign commerce. The Germans have shown great activity in recent years in the opening up of foreign markets for their goods, especially in the Far East, where they have been making elaborate scientific study of the commercial opportunities.

The German Colonies.—The German colonial system dates from 1884 when her extension of empire beyond the limits of Europe began. According to the latest available figures in 1898 her foreign protectorates included an area of over one million square miles, with an estimated population of 10,600,000, the most important of the colonies being in Africa. The chief German colonies are Togoland, Cameroon, German Southwest Africa and German East Africa. Besides these there are several island groups in the Pacific, including Kaiser Wilhelm's Land, Solomon Islands, the Bismarck Archipelago and Marshall Islands. Finally there is the recent German acquisition of the Chinese harbor of Kiao-Chau with certain rights over the adjacent territory (see CHINA). The most important of Germany's colonies, especially Togoland, Cameroon and German Southwest Africa, showed, according to the latest published statistics, an excess of expenditures over revenue. It was reported in 1898 that the Imperial contributions to the colonial revenues had greatly increased over 1897 and that the value of the goods exported to the German colonies did not exceed the sum of these contributions. It was also stated that in 1898 Kiao-Chau alone cost the

Imperial government the sum of £425,000. As to the colonies in Africa, it was reported in the Consular Reports for 1898 that the total value of the trade between the German Empire and the African colonies amounted in 1896 to \$2,837,000, of which \$534,500 were imports. The white population of the African colonies was estimated at 3,580, of whom all but 1,778 were Germans, 1,350 being officials and soldiers. For a further account of the German colonies, see the special articles.

Railways, etc.—The larger part of the railways of Germany are owned by the Imperial government or State governments. In 1896 there were 28,882 miles open for traffic and of this only 2,817 miles belonged to private companies. The canal system at the beginning of 1897 had a total length of 8,654 miles. In 1898 a new canal was in process of construction comprising a line joining the river Rhine with the Dortmund-Ems canal and another line joining the latter with the river Elbe. When completed this will unite the North German waterways and cheapen transportation throughout a large part of the Empire. In 1896 the mileage of telegraph line was 84,370.

Finance.—The main sources of revenue for the Empire are customs and excise duties, federal contributions, and the posts, telegraphs and State railways. The budget estimates for 1897-98 were, for revenue 1,295,468,000 marks and for expenditure 1,307,576,000 marks. The federal contributions are levied according to the population at a certain rate fixed each year in the Imperial budget. The estimated revenue for 1898-99 was £69,157,400 and the estimated expenditure £70,561,800. The public debt in 1897 was £113,063,000. The monetary unit is the mark, which is equivalent to 23.8 cents in United States currency. The monetary system is gold monometallism. On January 1, 1898, the stock of gold in Germany was estimated at \$668,500,000. See the article **MONEY**.

Army and Navy.—The law of August 31, 1893, to remain in force until March 31, 1899, provided that the peace strength of the army should be 479,229 men. In 1897 the peace footing was 562,352 men and 23,088 officers. The re-organization undertaken on April 1, 1897, was completed in May, 1898. As a result the number of infantry battalions was increased from 538 to 626 and the number of regiments from 173 to 215. In 1898 the mobilized strength of the army was estimated at nearly four million men. (See succeeding paragraph on Measures before the *Reichstag*.) In December, 1897, there were 16 battleships and 1 in process of construction; 19 coast defence ships; 8 cruisers and 2 in process of construction; 114 torpedo craft and 6 in process of construction; and 12 lookout ships. In 1898 a new naval programme was begun. According to this it was intended that the fleet should include 24 battleships; 32 cruisers; 11 dispatch vessels; 4 gunboats; and 113 torpedo boats. A number of important vessels were in process of construction during the year.

Emigration.—The great tide of emigration set in toward the close of the seventies. In 1881 the number of emigrants was 220,902, which surpassed that of any previous year. Since then it has declined and for several years following 1885 it averaged about 100,000 annually. In 1892 it was 116,339. The decline since then has been rapid and in 1896 it was 33,824, little more than the average annual number for the period of 1874-78. By far the greatest number of the emigrants went to the United States. In 1896, 29,007 went to that country and 1,001 to Brazil and 2,152 to other American countries; Africa, Asia and Australia receiving the rest. In the year ending June 30, 1898, the emigrants to the United States numbered only 17,072.

HISTORY.

Political Situation.—Before describing the events of the year 1898 it may be of interest to review the recent history and present status of the political parties of Germany. In point of rapidity of progress the Social Democratic party of Germany leads all the rest. It will be remembered that between the years 1878 and 1890 this party was the subject of a law which the *Reichstag* passed under the influence of Prince Bismarck. The crime of Hödel and Nobiling, who tried to assassinate the old Emperor William I, was on somewhat doubtful evidence fastened on the Social Democrats. They were in consequence subjected to repressive legislation, and at the same time Bismarck made a bid for the support of the workingman by measures of what has been called State or Imperial socialism as illustrated by the law for the compulsory insurance of workingmen. In spite of repressive measures and in spite of the attempt of the government to win the workingman's favor, the Social Democratic party continued to thrive. In 1877 the election returns showed that the Social Democrats obtained nearly 493,000 votes. Ten years later 763,000 votes were recorded for them, and in 1890 the number was 1,427,000. In the election of 1893, the number of votes rose to 1,786,000, and in 1898 to 2,100,000 in round numbers. But in spite of this large popular vote the number of their seats in the *Reichstag* was comparatively small, for the Social Democrats had in 1898 but 56 out of 397 seats, yet the large number of political parties in Germany is in part accountable for this, and the Social Democrats in several important instances have cast the deciding vote. Outside of Germany the Social Democratic party is viewed as a very radical organization with aims which if

realized would overthrow the present capitalistic organization of society. As time has gone on, however, the more practical members of this party have seen that it is only by gradual steps that these ultimate aims can be realized. The methods of the party, therefore, are quite distinct from its aims. In aims it is revolutionary, but in all matters of method it is hardly to be distinguished from some of the other parties. For instance, it has voted with the Liberals against the raising of the taxes on necessities and against bimetallism, and it has opposed the attempt of the land-owners to turn the *Reichsbank* into a State institution, acting in the latter instance on the principal that it was bad policy to strengthen the hands of the present government. As the opposition party to the government it has become the refuge of malcontents of all sorts. This as well as the prevalence of socialistic ideas accounts for its rapid increase. See SOCIALISM (paragraph Germany).

The Liberal party in recent years has apparently lost ground. During the ten years following 1866 they were very prominent, and most of the legislation at that period bore traces of their principles. For instance, they upheld the freedom of the press, and of industry; the adoption of the single gold standard and the system of banking which was finally put into effect. During this time Bismarck inclined toward the Liberals, but abandoned them as soon as it was seen that they desired a share in the government. The party afterwards, became weakened by divisions. The German People's party, the South German People's party, and the Liberal Union party, all stand on the strongly liberal platform. The National Liberal party in point of numbers nearly equals the Social Democrats. If all the Liberal parties were welded together it is evident that they would make one of the strongest groups in the *Reichstag*, and efforts have recently been made to unite them. Union has been prevented, however, largely on account of the personal rivalries of the leaders. Among these leaders the most notable is Eugen Richter, the chief of the South German People's party.

The Centre party is composed of Ultramontanes, that is, Roman Catholics, whose political platform has been shaped largely by the attempt of Bismarck to withstand Papal influence. The party, therefore, dates from the period of the *Kulturkampf*, and may be regarded as a product of the May laws. In constitutional matters it votes chiefly with the Left and on economic questions with the Right.

Another important party group is the Conservatives, who as a result of the elections of 1898 held 53 seats in the *Reichstag*. The majority consists of the old Prussian landed aristocracy (the Junkers), and the minority, known as the independent conservatives, are less reactionary in their views. A leading member of the Conservatives is Count von Kanitz, who has made himself famous in his efforts to aid the home producers of grain. These are the principal groups, but there are smaller parties, such as the Alsace-Lorraine Deputies, Poles, Guelphs and Anti-Semites.

It would appear from this that Germany has not reached the stage of development at which two great political parties divide the field. The result is that the issues are indistinct and the ministry cannot tell beforehand to what parties to look for support for its measures. Much of the confusion in German politics which often renders them almost incomprehensible to the American or the Englishman is due to this fact.

The present Chancellor of the Empire is Prince Hohenlohe-Schillingsfürst, whose policy has in the main been conciliatory toward the parties in the *Reichstag*. He has not imitated Prince Bismarck in the latter's brusqueness or his tendency to bully the opposition into compliance, nor has he been as direct and straightforward as his predecessor, Count von Caprivi, but he has shown himself a sagacious statesman and has exercised much discretion in the choice of his secretaries. The Secretary of State, Bernhard von Bulow, won popular favor by the successful outcome of Germany's colonial policy. The acquisition of Kiao-Chau took place soon after his entry into office, and his policy in regard to this acquisition met with favor from common-sense people of Germany. He declared that it was not to the interest of Germany to monopolize the trade of any portion of the Chinese Empire, but to "live and let live."

The Naval Secretary, Rear Admiral Tirpitz, has thrown in the weight of his influence with the policy for the increase of the navy. The demand is for seven battle-ships of the line, two large armor-plated cruisers, and seven small cruisers to be added to the present navy within a period of seven years and at an expenditure of a sum not to exceed 200,000,000 marks. Whether or not this accession to the navy has anything to do with Germany's designs in regard to the Far East is a question not yet decided.

The most important question at present agitating German politics is the Agrarian question. This question has arisen in consequence of the great expansion of all German industry. Some fifty years ago almost all of the food that was consumed in Germany was raised within its limits. Her total imports and exports amounted to between 1,000,000,000 and 2,000,000,000 marks. In 1896 the imports had risen to 4,558,000,000 marks and the exports to 3,753,000,000 marks. Of this, 2,000,000,000 marks represents the amount of agricultural and forest produce imported. The

increase in the amount of food consumed by Germany is of course due to the great increase of the population, which has risen from 35,000,000 in the middle of the century to 54,000,000 at the present time; but while the increasing amount of imports is a sign of the general advance of Germany in industrial matters, it has pressed with great severity upon the agricultural classes. Just here is the root of the Agrarian difficulty. The Agrarians wish protection for the home producer of agricultural products. They are opposed to that policy of commercial treaties by which the administration of Count Caprivi won renown. Besides annulling these commercial treaties they advocate the establishment of a bimetallic standard. The nucleus of this Agrarian party is of course the old landed aristocracy of Prussians known as the Junkers. Their influence in the State is considerable, but is thought by many to be declining. Yet they are a powerful class and must be reckoned with by party leaders. Herr von Miquel, the Prussian Minister of Finance and the leader of the National Liberal party, has secured their favor by a number of concessions, but it seemed probable in 1898 that they were expecting from him more than he was willing to grant. See AGRARIAN MOVEMENT.

The Germans at Kiao-Chau.—At the beginning of the year 1898 the most important subject of discussion was the German acquisition of the harbor of Kiao-Chau, in China. This was seized by a German naval force toward the close of 1897, and in January, 1898, it was announced that China had leased Kiao-Chau to Germany for ninety-nine years, permitting the latter power to construct a dock and a fortified coal-ing station at that point. See the article CHINA (paragraphs on History).

The June Elections.—On June 16, 1898, there was a general election of members of the *Reichstag*, that body having been dissolved by the Emperor with the hope that a more compliant majority might be found in the next. The result of the election showed losses for the Conservatives, National Liberals, South German Democrats, Poles and Anti-Semites; and gains for the Centre, the Advanced Radicals, the Han-overian Guelphs, the Alsatian party of protest and the Social Democrats. The Social Democrats gained eight seats in all, although they lost two seats to the Advanced Radicals in the election at the capital. From this account it will appear that the Kaiser was disappointed in his hopes of finding a more obedient Parliament. The balance of power continued to be held by the Clericals, who have begun to demand radical changes in favor of the Roman Catholic interest, and to insist anew upon principles which had been condemned by the Liberals during the *Kulturkampf*. An unusual feature of the campaign was the active part taken by women. Their indirect influence was very great and many of them, particularly in the Social Democratic party, went about persuading men not to fail in their duty toward their party. One significant result of the June elections was the defeat of the Agrarian League, of whom only four candidates were chosen to the *Reichstag*. The Agrarians do not constitute a separate party, but consist of members of several parties who incline to its characteristic views on the subject of a protective policy and the promotion of agriculture. (See the article AGRARIAN MOVEMENT.) The four members mentioned were independent representatives of the party, but in the *Reichstag* itself there were between 90 and 100 whose votes might be relied upon by the Agrarians.

Attitude Toward the United States.—The attitude of the German press toward the Spanish-American War occasioned some surprise in the United States. Its tone was distinctly unfriendly toward the United States, whose people saw with chagrin the evident dislike felt for them by the Germans. Not too much importance, however, was to be attached to these comments in the press, for the official attitude of Germany remained entirely neutral. Nevertheless, when to this hostile tone of public opinion was added the discourtesy of the German admiral at Manila, there was an emphatic expression of resentment in the newspapers of the United States. But the whole affair blew over, there being no sign that the German government was actuated by unfriendly motives. See article SPANISH-AMERICAN WAR and UNITED STATES (paragraphs on History).

The Emperor's Visit to the Holy Land.—In the autumn of 1898 the Emperor William started on a visit to the Holy Land. This had been talked of for a long time and there was much speculation in regard to the real object of the journey. The declared object of the Emperor's visit to Jerusalem was the consecration of an evangelical church, the Church of the Redeemer. The Emperor left Venice Oct. 13, and reached Constantinople Oct. 17. The original plan had been to pay first a visit to Egypt, but this was abandoned. After the Imperial party had left Venice the news came of the arrest of a large number of anarchists on the charge of a plot against the Emperor's life. According to the report it had been planned to assassinate the Emperor when he was passing through Cairo. At Constantinople every precaution was taken by the police. The Emperor reached Jerusalem on Oct. 29. The party was received with imposing ceremonies. After a visit to the Tower of David they went on foot to the Church of the Holy Sepulchre. The ceremony for which the Emperor had come, namely, the consecration of the Church of the Redeemer, was

performed with elaborate ceremonies on Oct. 30. There was a general feeling that the Emperor's visit to the Holy Land had an international significance, but just what this significance was could not be definitely made out from the mass of conjecture in regard to it. In the course of his tour he spoke frequently of Germany's intention and ability to protect German Christians wherever they might be. This, it was said, was a retort to the declaration of the Pope in a letter to the Archbishop of Rheims on Aug. 20, and in an address to the French pilgrims on Oct. 8, to the effect that the Catholics in the East were under the protectorate of France—a declaration which had caused offense in Germany. The pilgrimage was regarded with general approval in Germany, where it was thought that the object of the Emperor had been in the first place to maintain in the face of the diplomacy of the Vatican and of the French Republic Germany's right to protect German Catholics in the East and in the second place to open up German commerce with the East. One effect of his policy in the matter of the German Christians in the East was to unite the government with the party of the Centre, the latter having taken the national point of view and refused to allow itself to be influenced by the Pope. This result seems to promise an important effect upon the grouping of political parties in the *Reichstag*. It would seem in general that the friendship between Turkey and Germany was strengthened and that the interest of Germans has been renewed in the development of trade with Asia Minor. To some it seemed as if the ultimate result would be German ascendancy in the near East. Important commercial privileges were granted to Germany, including possession of a port and the right to construct a railway from Bagdad to the coast. It was also said that German capital would control the proposed railway between the sea of Marmora and the Persian gulf.

The Lippe-Detmold Affair.—Just before the Emperor started on his Eastern journey public interest in Germany was greatly aroused by an incident in connection with the question of succession to the principality of Lippe-Detmold. The accounts published in the English and American press in regard to this matter do not give a clear idea of its meaning or importance. As explained by a writer upon German politics, the main points appear to have been as follows: The last Prince of Lippe-Detmold having died without issue, there were conflicting claims to the succession. While these claims were pending, Prince Adolf of Schaumburg-Lippe, the Emperor's brother-in-law, was installed as Regent. At last the parties to the dispute agreed to submit the affair to the arbitration of the King of Saxony, who pronounced in favor of the Count of Lippe-Biesterfeld. The latter was accepted by the people of Detmold as Regent, but not as Prince. The Emperor's brother-in-law had to give up his position as Regent. This was against the wishes of the Emperor, who sent a telegram to his brother-in-law saying that the principality could never find a better Regent than him. A further slight was offered by the Emperor to the Count of Lippe-Biesterfeld on the occasion of a review in the suburbs of Lippe. The Emperor completely ignored the existence of the Regent, as well as of the troops of the principality. There were other signs of the personal hostility of the Emperor, and of these the most conspicuous consisted in withholding from the Count the military honors which were ordinarily rendered to members of his family. The Count thereupon ventured to address the Emperor personally, and to beseech him in respectful language to cause the general commanding the place to change his attitude toward the Regent. He received in return a sharp reply by telegraph. Thereupon the Regent brought a complaint against the Emperor before a competent court. The Emperor, on the other hand, in his character as King of Prussia, proposed that the Federal Council should declare itself competent to determine all contests relative to succession which might arise between the princes of the German Empire. The result of such a course on the part of the Council would have been in the first place to re-open the whole question of the Lippe-Detmold succession, and in the second place, to establish a precedent for the Emperor's exercise of the right of determining for himself the form of government which he favored. It did not seem probable that the Emperor's project would be adopted. The affair, so slight in its beginning and in some aspects so absurd, really presented very serious difficulties, and opened up questions of the greatest importance in regard to the future of the German political system. The growing jealousy of Prussia on the part of the minor states of the Empire led to considerable irritation among the princes who, in South Germany especially, are hostile to the spirit of militarism which Prussia represents. They denied the right of the Federal Council to decide on the succession claims in the different states.

Measures Before the Reichstag.—The new *Reichstag* assembled in December, 1898, but after a week's work adjourned for the holidays. Not much was accomplished beyond some rather vehement eloquence on the part of opposition members such as Herr Richter and Herr Bebel, who sharply arraigned the government's recent policy, especially the expulsions in northern Schleswig. The invectives of the opposition were not taken very seriously although they expressed the view of a considerable element in the population. It was recently said by a Berlin newspaper that the *Reichstag* was

"the only asylum left within the Empire for the unfettered word" and in affording an outlet for violent speech it seems to serve as a safety valve. Among the important measures which were awaiting action at the close of the year 1898 was the new military bill, for which a safe majority was expected. The peace footing of the German army had been increased six times since 1872, rising from 350,000 at that date to about 600,000. The additional expense involved in the proposed increase was placed at 132,778,000 marks, which was a non-recurrent appropriation and 27,388,000 marks, a regular appropriation. The law provided that from the first of October, 1899, the number of men with the colors should be gradually increased until in the year 1902 it should reach the figure of 502,506. And this effective should continue until March 31, 1904. It was also provided that the Federal States should have a separate military administration, contributing to the effective army in proportion to their population. This increase would bring the formations to the following figures in 1902: Infantry, 625 battalions; cavalry, 482 squadrons; field artillery, 574 battalions; artillery not mounted, 38 battalions; pioneers, 26 battalions; troops for the railway and telegraph, 11 battalions; train 23 battalions. Coming at a time when there seemed to be no especial danger of war either from national complications or from the increased armaments of neighboring states and with the Czar's peace proposal causing so much comment, this increase of the military effective occasioned some astonishment. The friends of the measure justified it by saying that while the Czar's pacific attitude showed that for the present war was not to be expected from that quarter, there was no sign that disarmament would take place and it was hardly to be hoped for. It was said that the vote for the increase of the peace effective was the price which the government asked for consenting to the law modifying the two years' service and that it would not maintain that law longer than the period during which the increase in the effective lasted. Another measure was for the increase of invalids' and veterans' pensions. A naval appropriation bill was also to be considered, but the time had not come for increasing the navy to the extent desired in some quarters, where it was urged that the German navy should at least be placed on an equally strong footing with the American. According to existing plans, the tonnage of the American navy in 1901 would be considerably in excess of the German. An economic measure of importance to Americans was the imperial meat inspection bill, which if favorably acted upon would, it was hoped, result in a more just attitude toward American meat than was shown under the existing legislation of the different German states, but in some quarters it was feared that the measure, while apparently showing no discrimination against Americans, would in effect operate prejudicially to them. The importation of American meat into Germany seems to have greatly increased. In 1896 it was estimated at 27,000,000 pounds, in 1897 at 53,000,000 pounds, and in the first ten months of 1898 at 80,000,000 pounds.

An important piece of work before the *Reichstag* was the settlement of the social question which threatened to precipitate a conflict between the government and the *Reichstag*. In a speech which he delivered in the summer of 1898 at a banquet at Veynhausen, the Emperor announced a measure for the protection of labor and those who wished to labor. It was to be aimed at all who tried to cause discontent among workingmen. These agitators were to be condemned to detention in a house of correction. The speech caused great irritation among the workingmen and Socialists, for it seemed to them that the project aimed to suppress freedom of association which was regarded as the chief element of their political and social independence. The official press tried to allay their apprehension by saying that the project had nothing to do with the right of association itself, but merely aimed to prevent the terrorism of workingmen who were disposed to work—such a terrorism as was often exercised during strikes. On the other hand it was urged that under existing laws such attempts when they went to the length of threats of violence were already punishable. There was therefore a tendency to suspect the Emperor of a more serious design. In his speech from the throne delivered at the opening of the *Reichstag* he announced a project of law tending to protect workingmen who desired to work but at the end of the year no action had been taken in regard to it.

Expulsion of Foreigners.—An important measure awaiting action in the Prussian Diet was the question of expelling Danes, Swedes, Norwegians, Russians and Austrians from the eastern border of Prussia. Much discussion took place on this policy during the year and a large portion of the German people as well as the press condemned it as barbarous. Considerable publicity was given to the arraignment of this policy by Professor Delbrück of the University of Berlin, who characterized it plainly as a system of persecution. By the government it was termed euphemistically a system of coercing "politically incommodious persons." See AUSTRIA-HUNGARY; also GERMAN LITERATURE, and ARCHÆOLOGY (paragraphs Switzerland and Germany).

GEYSERS. The distribution of geysers has been considered by Weed to be confined to areas of acid igneous rocks, and along natural drainage lines where mete-

oric waters accumulate for discharge, the source of the heat coming from escaping vapors or slowly cooling lavas, which have come to rest comparatively near the surface. Recent experiments to determine the causes of intermittent and constant discharge of geysers show, that they are boiling springs which are subject to the laws of hydrostatic pressure, in common with other springs. The geyser consists of a tube and reservoir, and the constant or intermittent action depends on the head in the latter, and also on whether the geyser has a continuous or intermittent off-flow. Those which are irregular in their action have continuously overflowing vents, while regular geysers have confined waters, and overflow only during eruption. In the former there is a continual inflow of cold water to the vent replacing that which runs off, and the ebullition necessary to produce eruption is prevented. If the water is confined and the heat supply constant, cold water rushes in only after each eruption, and a definite interval is required to bring the water at the base of the column to the boiling point. The change in head is produced by variations in the rainfall, the building up of a sinter cone around the geyser, or the forming of new outlets at lower levels.

GHIRLANDAIO, FRESCO, See PAINTING.

GIBBS, JOHN BLAIR, M. D., was killed in the fight at Guantanamo, Cuba, June 12, 1898. He was about fifty years old and was born in Richmond, Virginia. After his graduation from Rutgers College he entered the medical department of the University of Pennsylvania, and having taken his degree came to New York; built up a large and valuable practice there. After the outbreak of the war with Spain he was the first physician to be accepted from New York. He was assigned as assistant surgeon on the *Miantonomoh*.

GILBERT, JASPER WILLET, died in Brooklyn, New York, February 10, 1898. He was born in Rome, New York, January 15, 1812; admitted to the bar in 1835; became the first corporation counsel of Rochester after its incorporation in 1839; from 1865 to 1883 was justice of the New York Supreme Court.

GILBERT, Sir JOHN THOMAS, LL. D., author of numerous works on Irish history, died in London, England, May 23, 1898. He was born in Dublin in 1829 and was educated in that city and in England. He was Secretary of the Public Record Office in Ireland, at Dublin, 1867-75. When member of the council of the Royal Irish Academy and its honorary librarian, he aroused much interest in Celtic studies by publishing some important manuscripts of the ancient Irish tongue. He was a member of the Senate of the Royal University of Ireland; Governor of the National Gallery, Ireland; Crown Trustee of the National Library of Ireland; Vice-President and Honorary Librarian of the Royal Irish Academy, Dublin; Honorary Professor of Archaeology in the Royal Academy of Fine Arts; held the gold medal of the Royal Irish Academy; was member of the Council of the Pipe Roll Society of London; and Honorary Fellow of the Royal Society of Antiquaries of Ireland. Dr. Gilbert's publications were as follows: *Historic Literature of Ireland*; *Facsimiles of National Manuscripts of Ireland*; *Calendar of Ancient Records of Dublin*; *History of the City of Dublin*; *History of the Viceroy's of Ireland (1172-1500)*, 1865; *Historical and Municipal Documents of Ireland (1172-1320)*, 1870; *History of Affairs in Ireland (1641-52)*, 1879-81; *History of the Irish Confederation and War in Ireland (1641-49)*, 1882-90; *Documents relating to Ireland (1795-1814)*, 1893; *Jacobite Narrative of War in Ireland (1688-91)*; *Narrative in Connection with Maria Clementia Stuart, styled Queen of Great Britain and Ireland (1795-1814)*. *Crede Mihi*; *Ancient Register of Archbishops of Dublin*; *Chartularies of Abbeys of St. Mary and St. Thomas, Dublin*.

GINGKO. See BOTANY (paragraphs Spermatozoids in Gymnasperms).

GLACIERS. H. F. Reid's work on the periodic variations of glaciers, shows that a general retreat is to be observed in the glaciers of Asia, Europe and the United States, while those of Greenland show a slight tendency to advance. The stratification observed in glaciers, he concludes may come from successive snow falls on the *névé*, and this banding is very persistent, but is to be distinguished from the transverse blue banding seen especially in the constricted or very steep part of glaciers, and which is analogous to cleavage, which is occasioned by pressure of the moving ice.

GLADSTONE, WILLIAM EWART, died on the 19th of May, 1898, at Hawarden Castle, whither he had come from Cannes, March 22. His disease was of a cancerous nature, affecting the face, especially the nose and eyes, and for nine months he had suffered intensely but with patience. The funeral services began Wednesday, May 25, when the coffin was borne early in the morning to Hawarden Church, which was opened to the public at eleven o'clock. Throngs from the country round about filled the church until half past five when there was a short private service, after which the funeral party proceeded to Broughton Hall Station and then by rail to

THE LATE WILLIAM EWART GLADSTONE.

From a new photograph by Numa Blum Fils, Cannes (France).

London. The same night the coffin, after being officially sealed, was taken into Westminster Hall, and the final arrangements were made for the morrow's lying in state. Beginning with Thursday morning immense crowds viewed the coffin for two days. The state funeral, which had been provided for by special act of Parliament, was held Saturday, May 28, at eleven in the morning. The funeral procession entered the Hall in the following order: The House of Commons, the House of Lords, Privy Councillors and representatives of royal personages, the bier, and relatives and friends of the deceased. The pall bearers were: the Prince of Wales and the Duke of York, representing the crown; the chiefs of both parties, Lord Salisbury and Lord Kimberley, Sir William Harcourt and Mr. Arthur James Balfour; and Mr. Gladstone's old friends, the Duke of Rutland, Lord Rosebery, Lord Rendle, and Mr. Armitstead. It is doubtful if the state ceremonies have ever been surpassed in dignity and impressiveness. The grave in the Abbey is between the monument of Admiral Sir Peter Warren and that of Earl of Mansfield, and Mr. Gladstone's statue is placed near that of his old leader, Sir Robert Peel, facing the statue of the Earl of Beaconsfield, who was the first stumbling-block to Peel as he was afterward the greatest opponent of Gladstone. Mr. Gladstone's titles, as announced at the funeral by the Norroy King of Arms, were as follows: "The Right Honorable William Ewart Gladstone, one of Her Majesty's most honorable Privy Councillors, sometime First Lord Commissioner of the Treasury, Lord Privy Seal, Chancellor and other Treasurers of the Exchequer, Her Majesty's Principal Secretary of State for the Colonies, President of the Board of Trade, and Lord High Commissioner Extraordinary for the Ionian Islands." Memorial services were held in various towns throughout England. All classes felt that the cause of humanity and righteous politics had lost a champion, and the profound hush which fell on both Great Britain and America, when his death became known, was significant of the people's love for Mr. Gladstone.

The final place that history will give to Mr. Gladstone cannot yet be definitely determined. While in general he has received almost unqualified eulogy, there were those who held that he was largely a creature of circumstance, one who, shrewdly drifting with the tide of popular feeling, was exceedingly overestimated, and that his wonderful versatility led the people to attribute to him a greatness that was not his. Great though he was as orator, essayist, scholar, theologian, parliamentarian, he had in each of these his superiors; and yet beyond all doubt there was no other man of his time who so magnificently combined the really great orator, essayist, scholar, theologian and parliamentarian. Throughout his long life Mr. Gladstone was famous as an orator. The power of his oratory lay in his own strong personality, his energy in delivery, and the clearness with which he presented his theme. Unlike Burke and Pitt, but few of his speeches will live as great specimens of oratory for in the magic of the spoken word lay his power. Though a prolific writer, he never achieved any considerable permanent success in literature because so much of what he wrote is nearly unreadable; for Disraeli's sarcastic remark about his "exuberance of verbosity" certainly contained some truth. We must not, however, overlook his real power. While scholars may disparage his classical studies, and philosophers his theological work, his writings on the relations of Church and State and on subjects of practical and theoretical politics, have a permanent value and interest. Mr. Gladstone's scholarship was of the old school, but profound, and his general knowledge was encyclopædic, embracing a vast number of unrelated subjects; in this he closely resembled, though he probably surpassed, Macaulay. He was a lover of art and of music, but a connoisseur of neither. Though Handel was a favorite with him, he usually preferred easy, simple melodies, and once in his old age, when speaking of the Welsh and their music, said, "their *Men of Harleck*, in my judgment, for the purpose of a national air, and without disparagement of *God Save the Queen*, or anything else, is the finest national air in the world." He was always an insatiable book collector and reader; "a book collector," he said, "ought as I conceive to possess the following qualifications: appetite, leisure, wealth, knowledge, discrimination, and perseverance. Of these I have only had two, the first and the last, and these are not the most important." In him was a peculiar combination of conservatism and the spirit of reform. He clung tenaciously to the past until he saw that old methods could no longer solve new problems; then with all the force of his nature he would espouse the new cause with the new method. So we see him during the early part of his career a Tory, during the latter part a Liberal, during all his life a loyal member of the English Church. He may be called "a Puritan High Churchman. He remembered, that is, so to be an Anglican as not to forget that he was a Protestant and an Englishman."

It is not our purpose to review the career of Mr. Gladstone, but to reflect somewhat the thought and expression relative to him subsequent to his death. Some Americans have felt that, because of his old statement concerning the army, the

navy, and the "nation" which Jefferson Davis "created," he was unfriendly to the United States. Though Gladstone was an apostle of freedom, he was not democratic as we are democratic; he was conservative, he was a lover of monarchy. And so it is probable that there are many things in American institutions and methods which he did not like; but it is safe to say he was the friend of America; he admitted his mistake concerning the confederacy; he realized our greatness and predicted our commercial supremacy. He said "there can hardly be a doubt, as between the America and the England of the future, that the daughter at no very distant time, will, whether fairer, or less fair, be unquestionably yet stronger than the mother." The trend of his thought and work—his desire for the advancement of the spirit of true civilization and culture—was toward a feeling of closer sympathy and kinship between the English and American peoples. In dealing with the *Alabama* claims in 1872, he insisted upon arbitration. The amount awarded to the United States, however,—about \$16,000,000—was always a humiliation to Mr. Gladstone, who justly prided himself on his financial shrewdness and ability.

He was a lover of peace, a supporter of the principle of arbitration, but was not blind to the fact that sometimes war becomes necessary. When he heard of the Bulgarian atrocities, he thought that the English admiral at that time in Besika bay "should inform the government of Constantinople that from that hour, until atonement had been made, until punishment had descended, until justice had been vindicated, not a man, nor a ship, nor a boat should cross the waters of the Bosphorus, or the cloudy Euxine, or the bright Ægean, to carry aid to the Turkish troops." At the time of the Armenian massacres, he would have had an English fleet sent to Constantinople summarily to end the barbarities. To large and permanent military establishments Mr. Gladstone was firmly opposed. Fifty years ago Sir Robert Peel, seeing the economic evils arising from standing armies, appealed to the European nations for disarmament; and Mr. Gladstone to the end of his life reiterated and augmented the mighty words of his early master. He also denounced the "imperial" policy of England as being usually both unwise and immoral; he tried to turn the attention of the government more to questions of land laws, reductions of public expenditure, Irish troubles, Indian finance, and national education. "The lust of territorial aggrandizement," he said, "is the original sin of nations."

His death reopened to some extent the discussions of the attitude of the British Government toward General Gordon in his Soudan expedition of 1884. It has been said that the tardiness of Mr. Gladstone in recognizing the need of General Gordon and in sending him assistance was the gravest error he ever committed. He received violent censure for this both at the time and during succeeding years. It seems improbable, however, that severe blame will finally rest upon Gladstone for the unfortunate affair. The Egyptian policy of the government was forced upon Mr. Gladstone and he was obliged to accept the responsibility of a situation which he himself would never have created. Mr. Justin McCarthy says that Gladstone was not responsible for Gordon's death and that the difficulty of getting troops to Khartoum was sufficient excuse for the government. There is no doubt that the public, fascinated by the striking personality of General Gordon, and aroused by the Coercion Acts, the Phoenix Park murders, the Egyptian policy and the bombardment of Alexandria, too readily blamed the Gladstone government. In January 1884, General Gordon returned to the Soudan, having received permission to do this in the absence of Mr. Gladstone. In the House of Commons, Mr. Gladstone himself stated the purpose of this expedition: "General Gordon went not for the purpose of conquering the Soudan, or to persuade the chiefs of the Soudan, the Sultans at the head of their troops, to submit themselves to the Egyptian Government. He went for the double purpose of evacuating the country by extricating the Egyptian garrisons, and reconstituting it by giving back to these Sultans their ancestral powers, withdrawn or superseded during the period of Egyptian occupation." General Gordon was to employ only pacific measures. He did this upon reaching the Soudan, but being unsuccessful he resorted to military means and from his movements it seemed to some observers that he even intended making himself a kind of Sultan of the region. It is stated that he could easily have retreated before he entrenched himself at Khartoum, indeed up to the time of the fall of Berber. Lord Granville said that in the latter part of January 1885, the government received cheerful messages from General Gordon, but on February 4th came the news of the fall of Khartoum.

The Home Rule Bill has been attributed by Mr. Bryce to Mr. Gladstone's intense perception of the unfairness and cruelty with which England had treated Ireland. He had faith in freedom as that which makes men better and more competent, and he "believed implicitly in the good instincts of the masses." His memory is honored not only as a great statesman, ruler, law-giver, but as a man who thought and worked for the elevation of men. As a statesman he doubtless did and said things that were unwise, but no one ever questioned the sincerity of this purpose

or his patriotism; he was a "practical politician" who had kept himself "unspotted from the world."

In the death of Mr. Gladstone the Liberal party suffered an irreparable loss; for although he had retired from public life four years previously, it was not until his last illness that the leaders ceased to ask and act upon his counsel; while the loss of his moral support and influence was greater than that of his direct political advice. And it may finally be said that, with due appreciation for his qualities of intellect, for his tireless persistence, for his powers of persuasion and command, no just conception of Mr. Gladstone can be attained that does not make the moral and spiritual element preëminent and dominating.

GOLD. Production.—The world's production of gold for the last two years, and for 1886 which it is of interest to give in order to show the greatly increased production of this metal, was:

1886.....	\$99,250,887.
1897.....	237,332,456.
1898.....	286,218,954.

The output of the different countries can be best seen from the following table, which is taken from the statistical number of the *Engineering and Mining Journal*.

COUNTRIES.	1897.		1898.

The great increase in production is due partly to the improved methods of mining and metallurgy, and the steady decrease in the cost of material. At the present

day ores running five dollars per ton, and sometimes even less are not uncommonly worked. In the United States Colorado, South Dakota, and Utah show the chief increase in production, while in foreign countries, great gains were shown in the Coolgardie, Witwatersrand, and Klondike districts. The first two probably represent an increased production of a permanent nature, but the third being placer deposits, may be only temporarily productive. The world's production of gold is obtained at present from twelve districts, *i. e.* the Witwatersrand, in South Africa, Coolgardie, and Kalgoorlie, in Western Australia; Ballarat, and Bendigo, in Victoria; Charter Towers, and Mt. Morgan, in Queensland; The Colar field of Mysore, in India; Cripple Creek in Colorado; Black Hills in South Dakota, Mother Lode in California and Douglass Island, and the Klondike in Alaska.

The United States Geological Survey has been making an examination of the gold resources of Alaska, and finds that the deposits consist of two kinds, *viz.* quartz veins and gravel deposits. The former have thus far been developed only in the coastal regions, where there are many mills for crushing the ore. The chief deposits lie in a belt about one hundred miles long reaching from Sundum on the southeast past Juneau, to Berner's bay, and a second belt is found further west in the vicinity of Sitka. The ores are not always rich but the excellent facilities permit cheap working. The veins are in metamorphic slates, diabases, and granites, similar to those of California, and are possibly of the same age, but farther north on Unga Island of the Shumagin Group they occur in Tertiary volcanic rocks, and as such rocks abound in the islands of that vicinity, this occurrence is of interest. In the interior of Alaska in the Yukon Region, gold has thus far only been found in gravel deposits, but it has probably been derived originally from a series of rocks known as the Birch creek and Forty Mile formations. The gravel deposits are found in gulches tributary to the Klondike river, above Dawson, and similar ones have been found along Indian creek and Stewart river, all of these lying in the line of strike of the gold-bearing rocks of the Forty Mile district. Of the Klondike tributaries, the southern ones such as the Bonanza, Eldorado, and Hunker Creeks have afforded the richest gravels. No gold in paying quantities has been found in the valley of the Klondike river itself. The famous Comstock Lode at Virginia City, Nev., which has passed through such a series of misfortunes, and whose lower workings were at one time abandoned owing to the enormous inflow of hot water, is to be reopened. The water is to be pumped out by means of a hydraulic elevator which will be used on a large scale; it will have a capacity of about 10,000 gallons per minute, and the work will be the largest yet undertaken by this type of machine.

Metallurgy.—The gold ores of Alaska, California, and South Dakota are treated chiefly in stamps and amalgamation mills, and the same process is used to some extent in Colorado. The chief method of extracting gold from its ores especially in Colorado, Utah, Montana, and in part California and Arizona as well as in portions of the southern Appalachian States are the cyanide and chlorination methods, and this leaching process of gold extraction is growing in favor, although metallurgists are not yet thoroughly agreed as to which of the two wet methods mentioned is the best. There are between 40 and 50 cyanide lixiviation works in operation in the United States at the present day, and a lesser number of chlorination ones. The processes have to be modified at different localities depending on the character of the ores, many of which have to be first roasted.

Literature.—J. F. Kemp contributes a valuable monograph on the occurrence of telluride gold ores, in the *Mineral Industry* for 1897, in which he shows that the occurrence of gold in this form is far more wide spread than was formerly supposed. The celebrated Cripple Creek ores, and many of the Black Hills deposits are of this nature.

Other recent publications of importance are *The Gold Fields of Australasia* by Schmeisser and Vogelsang, *The Witwatersrand Gold fields* by S. J. Truscott, and *L'Or dans le Nature* by Caneng and Robellaz. The aim of the last named work is to present in condensed form the latest information concerning the occurrence of gold in nature and its geographical distribution.

GOLD AND SILVER, MELTING POINTS OF. D. Bertholet gives us the latest figures on the melting points of these two metals. These were determined by means of the thermoelectric couple of platinum and platino-iridium. The values obtained for silver were between 959.2 and 966.2 C. with a mean of 962 C. while those for gold varied between 1,062.1 and 1,066.7 with a mean of 1,064 C.

GOLD COAST, one of the West African colonies of Great Britain, stretches along the coast of the Gulf of Guinea for some 350 miles and extends into the interior for about 300 miles. It has an area of about 15,000 square miles for the settlement proper and of about 46,600 square miles including the protectorate. Its estimated population is 1,500,000 of whom 150 are Europeans and its chief towns are

Accra (16,267), Elmina (10,530), and Cape Coast Castle (11,614). Its exports include gold, ivory, copal, palm oil, palm kernels, and India rubber. There is also an increasing trade in native woods. The revenue and commerce have increased considerably since 1892. Over 500 miles of railway have been built. It is administered by a governor with an executive and legislative council nominated. The colony was founded by a chartered company which, in 1821, transferred it to the crown. It has been a separate colony since 1874. It includes in its sphere of influence the protectorate Ashanti which was established as a result of the expedition of 1895-6 to the Ashanti capital, Kumasi. The king made a formal submission to the British authorities and there has since been a British Resident at his capital. The hinterland of the Gold Coast has recently been the subject of conflicting claims on the part of France and Great Britain, but in 1898 the Anglo-French commission which sat at Paris determined the boundary. See NIGER TERRITORIES.

GOLDEN CHAIN, ORDER OF, a fraternal society founded in 1881 has now 182 subordinate lodges, and 8,450 members, with headquarters in Baltimore, Md. Since 1881 it has disbursed \$1,895,640 and \$257,360 during its last fiscal year. Commander, Joseph A. Baden; Supreme Secretary, A. S. Wier.

GOLDSCHMIDT, JULIUS, United States consul-general at Berlin, died in that city, November 2, 1898. He was born in Osterode, Hanover, in 1847; came to the United States in 1867 and engaged in business in Milwaukee, Wisconsin. In that city he became a member of the Board of Trade, the Board of Education, and the Public Library Board. He served as consul-general at Vienna during the administration of President Harrison and in 1897 was appointed consul-general at Berlin.

GOLF IN THE UNITED STATES. Golf continues to increase in popularity in this country. While the use and care of the large tracts of land which the game demands still put private clubs beyond the means of many, large cities like New York and Boston are doing something to increase the number of golfers by providing free public links. Of private clubs there is a constant and rapid increase all over the country. On May 5, at Ardsley, Yale defeated Harvard and won for the second consecutive time the Intercollegiate Golf championship. The open golf championship of the United States was won at Hamilton, Massachusetts, June 18, by Frederick Herd, of the Washington Park Golf Club, Chicago, Ill., and lately of the Ancient and Royal Golf Club of St. Andrew's, Scotland. The play for the amateur golf championship at Morristown, N. J., during the week of September 19, resulted in the victory of Mr. Findlay Douglas, a graduate of St. Andrew's University, and of the St. Andrew's links, in Scotland. At Ardsley, Oct. 16, Miss Beatrix Hoyt defeated Miss Maude K. Wetmore. This is the third time that Miss Hoyt has won the woman's golf championship.

GOMEZ, MAXIMO, commander-in-chief of the Cuban army, was born of Spanish parentage in Bani, San Domingo, in 1838. Having entered the Spanish army he served in the island of Haiti. After San Domingo gained its freedom, he went with the Spanish troops to Cuba, and while at Santiago became disgusted with the cruelty and official dishonesty of the Spanish general, Villar, upon whom he made a personal assault, withdrawing thereupon from the Spanish service. He settled down as a planter, but on the outbreak of the Ten Years' war in 1868 he joined the insurgents and received a command from the Cuban president, Cespides. Together with the latter and General Agramonte, Gomez captured Bayamo, Juguani, Tunas, and Holguin. He also captured Nuevitas, Guaimaro, Santa Cruz, and Cascorro, and participated in the battles of Las Guasimas and Palo Sico. Subsequently Gomez invaded Santa Clara and defeated General Jovellar, being promoted at this time to the rank of major-general; upon the death of General Agramonte, Gomez succeeded him as commander-in-chief. In 1878 the Spanish governor-general, Martinez Campos, persuaded the Cuban leaders to accept terms of peace, whereupon Gomez retired to Jamaica and later went to San Domingo. He was engaged there in agriculture until sent for by the Cuban revolutionary president, Marti, at the outbreak of the second revolution of 1895. Then were planned the hostilities which did not end until the American victories over the Spaniards in 1898. Of the Cuban leaders in the rebellion the most prominent were Gomez, Antonio Maceo, and Calixto Garcia (q.v.).

GOODENOUGH, Lieutenant-General SIR WILLIAM HOWLEY, K. C. B., died Oct. 24, 1898. He was in supreme command of the British troops in South Africa, having his residence at Cape Town. He was born April 5, 1833; educated at Westminster; became second lieutenant Royal Artillery in December 1849. Promotion came and in the course of his career he held many high positions, including brigadier-general commanding the Royal Artillery of the expeditionary force in Egypt, 1882, and inspector-general of artillery, 1886-89. He served in the Indian Mutiny, 1857-58, and was severely wounded at Birwa; his gallantry was noted in the dispatches and won for him a medal and clasp. He was similarly honored for his conduct in the Egyptian cam-

paign of 1882 and was also made a C. B. In May 1891, he was appointed lieutenant-general of the Royal Artillery, and in 1897 became a K. C. B. He was joint author with Lieutenant-Colonel J. C. Dalton, R. A., of *The Army Book for the British Empire*. He married Countess Kinsky.

GOOD FELLOWS, ROYAL SOCIETY OF, a fraternal society founded in 1882, has now four grand assemblies, 202 subordinate assemblies, and 10,387 members. \$3,470,950 has been disbursed since its organization, and \$324,369 during the last fiscal year. Premier, J. H. McGregor, Montague, Me.; Secretary, J. W. Swoger, Boston, Mass.

GOOD TEMPLARS, INDEPENDENT ORDER OF, see INDEPENDENT ORDER OF GOOD TEMPLARS.

GORDON, WILLIAM W., Brigadier-General, U. S. Volunteers, a well-known citizen of Georgia, who at the outbreak of the Spanish-American War received his appointment of brigadier-general, being at that time colonel of the Savannah National Guard regiment. He served in the Civil War. On August 16, 1898, he was appointed by President McKinley a member of the commission to arrange for the evacuation of Porto Rico by the Spaniards.

GRAND ARMY OF THE REPUBLIC. The first post was organized at Decatur, Ill., April 6, 1866, and the first National Encampment was held in Indianapolis, Nov. 20, 1866. Commander-in-chief, James A. Saxton, Chicago. There are 45 Departments each being represented by a number in the National Council of Administration. The number of army posts in June 1898, was 7,213, and the total number or members 318,475. The last Encampment was held in Cincinnati 1898.

GRAND UNITED ORDER OF ODD FELLOWS OF AMERICA, composed of colored Odd Fellows, had in 1897, 2,281 lodges, and 155,537 members. Its property amounted to \$1,867,597. Grand Master, E. H. Morris, Chicago, Ill.

GRANGE, NATIONAL. See NATIONAL GRANGE.

GRANITE. See BUILDING STONES.

GRAPHITE. The production of graphite, during 1898, was 1,400,000 lbs. which, compared with the production of 993,138 lbs., in 1897, shows a gratifying increase. The only American locality supplying a high grade graphite continues to be Ticonderoga, N. Y., although good deposits have been reported from near Wheatland, Wyoming. An important event during the past year was the manufacture of an artificial graphite from coke, and which it is claimed can be sold at the same price as the natural product. Some amorphous graphite was mined in Rhode Island during 1898.

GRATING FOR SPECTRUM. See PHYSICS.

GRAVITATION-GRAVITY. See PHYSICS (paragraph Gravitation Constant).

GRAY, GEORGE, Democratic United States Senator from Delaware, was appointed by President McKinley August 26, 1898, one of the commission of five to negotiate a treaty of peace with Spain. He was born at New Castle, Delaware, May 4, 1840; was graduated at Princeton, 1859, and in 1862 received his A. M.; studied at Harvard Law School, and was admitted to the bar in 1863; was appointed Attorney-General of Delaware in 1879 by Governor Hall and again in 1884 by Governor Stockley. Mr. Gray was a delegate to the national Democratic conventions of 1876, 1880, and 1884; was elected to the Federal Senate in 1885 to succeed Thomas F. Bayard, who had resigned to become Secretary of State; was reelected in 1887 and in 1893. Mr. Gray has been a supporter of tariff and civil service reform and of sound money. Previous to his appointment to the Peace Commission, he was a member of the Anglo-American Joint High Commission.

GREAT BRITAIN and the BRITISH EMPIRE. The area of the United Kingdom of Great Britain and Ireland is 120,979 sq. m., with a population in 1891 of 38,740,180. The estimates of area and population for the colonies and other possessions vary, but according to recent reports are in round numbers, 11,250,000 sq. m. and 344,000,000 inhabitants. As to the number of British, it was placed at 39,500,000 in 1897, with 10,500,000 in the colonies, making a total of 50,000,000. Details in regard to the various possessions of Great Britain will be found in the separate articles on the British colonies, protectorates and dependencies. The following table compiled by the United States government in 1898 gives a list of these, together with their area and population:

India:	Area.	
	Sq. miles.	Population.
British India	1,068,314	221,172,952
Feudatory states	731,944	66,050,479
Total India	1,800,258	287,223,431

Mineral Products of the United Kingdom.—The principal minerals obtained from the United Kingdom are coal, iron ore, clays, sandstone, slates, limestone, salt, oil, shale, granite, whinstone, lead ore, tin ore, chalk, zinc ore, etc. These are given in the order of their importance as to the value of output in 1896, the estimate of value in the case of the metallic minerals being based on the values of the metals made from the ores. Of the non-metallic minerals coal is by far the most important. In 1896 the total amount of coal produced throughout the United Kingdom was 195,361,260 tons, of which the greater part was produced in England alone, the principal coal fields being in Durham, Yorkshire, Lancashire, Staffordshire and Derbyshire in England; in Glamorgan in Wales; and in Lanarkshire in Scotland. In 1896 there were 13,700,764 tons of iron ore produced in the United Kingdom, the value being £3,150,420. In the same year there were 373 blast furnaces and 21,204,284 tons of ore smelted. Despite the large home production of iron ore there were imported 5,438,307 tons with a value of £3,778,789. Among the minor minerals may be mentioned copper, lead, tin and zinc and of the non-metallic minerals the most important are, besides coal, various clays, sandstone, slates, limestone, salt, etc.

Agriculture.—Of the productive area of Great Britain and Ireland the largest acreage is taken up by permanent pasture, the next by the grain crops and the next by clover and grasses and green crops. In 1897 Great Britain had 7,457,061 acres in grain crops, 4,853,808 acres in clover and mature grasses, 3,189,508 acres in green crops, and 16,512,868 acres in permanent pasture. The production of wheat in Great Britain in 1897 was 54,913,000 bushels; barley 66,804,000 bushels; and oats 116,812,000 bushels, the last named being the only one of the three crops which showed an increase over the previous year. The wheat covered 1,889,161 acres; barley 2,035,790 acres; oats 3,036,056; turnips and swedes 1,833,145; and potatoes 504,914 acres. See IRELAND.

Manufactures.—Accurate statistics for the British manufactures during the year 1898 were not procurable. In respect to the numbers employed, the textile industries are the most important. A recent estimate places the number of people who are dependent upon the cotton, woolen and linen industries of Great Britain and Ireland at five million, and the capital invested at £200,000,000. The figures given in the following paragraphs on commerce afford an index to the industrial activity of the United Kingdom. See also COTTON and the COTTON INDUSTRY.

Commerce.—Great Britain is the leading commercial nation of the world. A comparison between the foreign trade of the United Kingdom in 1896 and that in 1897 is afforded by the following statistics: In 1896: total imports £441,808,904; exports of British products £240,145,551; exports of foreign and colonial products £56,233,663; total imports and exports £738,118,118. In 1897: total imports £451,238,683; exports of British products £234,350,003; exports of foreign and colonial products £59,833,677; total imports and exports £745,422,363. Of the total trade of Great Britain and Ireland over 90 per cent. falls to England and Wales. Commercial statistics for the years 1895-96 show that of Great Britain's trade with foreign countries, the chief sharers in respect to the imports into the United Kingdom were, in the order of their importance, the United States, France, the Netherlands, Germany, and Russia. The imports of merchandise from the United States increased from £86,548,860 in 1895 to £106,347,349 in 1896. As a purchaser of the manufactures and other products of the United Kingdom, Germany led all the other nations, and next came the United States and France. The exports of all products of the United Kingdom to Germany increased from £20,586,310 to £22,244,405 in 1896, while those to the United States decreased from £27,948,553 in 1895 to £20,424,225 in 1896. The articles most largely imported into the United Kingdom are food stuffs, the chief being cereals and flour. In 1897 out of a total of £451,238,683 imports, £151,550,115 consisted of articles of food and drink duty free, and £26,791,519 of articles of food and drink dutiable; £70,263,511 of raw materials for textile manufactures; £85,038,387 of manufactured articles; £52,085,336 of raw materials for other industries than the textile; and £21,265,363 of metals. The most important items in the exports of the United Kingdom are yarns and textile fabrics, which amounted to £96,618,472 in 1897, out of a total export of British products of £234,350,003. The United Kingdom imports most of her wheat from foreign countries and of these the United States sends the largest supply. As to the conditions prevailing in the trade in other commodities the following facts may

be of interest: It is estimated that less than a third of the butter consumed in the United Kingdom is produced at home. The United Kingdom exports a considerable amount of coal, the largest purchaser being France. Lately there has been an increase in the exports to Sweden and Norway. There were signs of depression in the cotton trade as a whole in the year 1898, owing to the doubtful outlook in international politics, but large quantities of cotton yarn and twist were exported in 1898, showing an improvement over the previous years. As to the exportation of hardware and cutlery there was a decline during the first ten months of 1898 as compared with the same period during the previous year, the demand of the United States especially having fallen off. There was also a decline in the shipments of pig iron and of railway material, and in the case of tin plates, for which the demand on the part of the United States showed a marked falling off. The exportation of jute manufactures showed an increase, and that of yarns remained about the same as in 1897, while linen piece goods showed a falling off. The ship-building industries seemed to be in a favorable condition and the output for the first nine months of the year 1898 was considerably larger than that during the same period of the previous year. The imports of timber, which were unusually large during 1897, declined somewhat in 1898. The exports of woolen yarn showed a slight decline during the first ten months of 1898, as compared with that period during the previous year, while worsted yarn slightly improved. The exportation of woolen piece goods considerably declined, especially in the case of the United States, which is said to have taken only about one-sixth of the amount sold there in 1897. The same was true of worsted piece goods, of which the shipments to the United States were about one-fourth of what they had been in 1897.

Great Britain's Foreign Trade Policy.—How far the present agricultural condition of Great Britain is due to her foreign trade policy is a question very earnestly discussed by economic writers. It is certain that the agricultural resources of the country as at present developed are wholly inadequate to the sustenance of its population. Having less than two million acres under wheat and with an average annual crop of sixty million bushels, Great Britain depends upon foreign countries for some two hundred million bushels of this staple and similar conditions prevail in respect to the other means of subsistence. Some attribute this largely to the reversal of the English foreign trade policy in 1846, and the subsequent introduction of free trade. Since that time the British government has devoted itself to the promotion of foreign commerce. In this work the Foreign Office has shown great energy. The principle of its policy has been the maintenance and encouragement of British trade abroad and especially the protection and preservation of British colonies and dependencies. Foreign commerce is to some extent the concern of all the chief departments, including beside the Foreign Office, the Board of Trade, the Colonial Office, the Indian Office and the Treasury, the work being divided among them, and there being no separate government department of foreign commerce. The statistical department is the Board of Trade, which publishes monthly and annual reports of trade and navigation. The consular service has not been utilized for the promotion of trade to the extent that it has in the United States, but in 1898 a committee, which had been appointed to consider a plan for supplying to the home trades the information furnished by consuls, commercial attachés and agents-general, reported in favor of the establishment of a commercial intelligence office by the government. There are signs of a demand that the government shall take a more active part in furthering foreign commerce. Hitherto it has confined its efforts to making that trade as free and as safe as possible. This need of a more practical interference has followed as a result of the competition with Germany and the United States, whose growing importance has caused concern in Great Britain. An English commercial attaché in Germany remarked in a recent report, that if Great Britain wished to retain her position as the greatest commercial nation in the world she would have a hard fight before her; that her overwhelming supremacy commercially and industrially was not the assured fact it once had been. A recent United States Consular Report makes the following statement in regard to the British foreign trade: "The foreign trade of the United Kingdom reached highwater mark in that year of world-wide activity 1890, the figures being \$3,645,000,000, of which \$1,282,300,000 was represented by British products and manufactures exported, an excess of \$75,000,000, over any previous year. In the following year of depression, figures fell much below this great total. They recovered in 1896 to \$3,591,500,000, but exports of British produce and manufactures did not recover in proportion, amounting to \$1,167,000,000. In 1897 the net decrease in exports as compared with the previous year was about \$28,000,000, there being in the export of yarns and textile fabrics alone the striking decrease of \$40,000,000, to some extent no doubt accounted for by the new United States tariff. In April, 1898, as compared with April, 1897, the falling off in exports exceeded \$10,000,000, and the first four months of this year as compared with the corresponding period of last year showed a decrease of nearly \$19,000,000." Yet during this same period the exports of continental countries increased at a high rate. Between 1885

and 1894 the exports from the leading nations of the continent are said to have increased at the following rates: The Netherlands, $24\frac{3}{4}$ per cent.; Russia, 27 per cent.; Austria-Hungary, 18 per cent.; Germany, $31\frac{1}{2}$ per cent.; Denmark, 67 per cent.; Belgium, $8\frac{1}{2}$ per cent.; Italy, 8 per cent., (including silver bullion); Norway, 26 per cent. So far as the increase of domestic products exported is concerned the United Kingdom showed a rate below any of these countries, being only $1\frac{1}{4}$ per cent. While the comparatively small rate of increase showed by Germany does not seem to justify the fear felt in England of German competition, it should be noted that German trade with the East has advanced rapidly and usurped much that was formerly British. In Great Britain the success of Germany is attributed first, to the direct aid afforded by the government as in the granting of bounties and subsidies, in the second place to the superiority of her agents and their adaptability to the customs prevailing in foreign markets, and in the third place to the credit system of Germany. A fact which is frequently remarked in Great Britain is that Germany's chief article of export is woollen goods, next sugar and third cotton goods, thus showing a power to compete with England in the latter's own commodities, and Germany sells these products in England's colonies. Another competitor feared by Great Britain is the United States, which has been working its way into European markets with its iron and steel products, selling them at prices with which German and British producers have been unable to compete. It is these considerations that have led to the protective movement in Great Britain, a movement which aims at an imperial customs union which shall protect the entire British Empire against the rest of the world. But since it is estimated that over two-thirds of Great Britain's over-sea trade is with foreign colonies and one-third with her own colonies, it is thought that the fiscal results of this policy would not be all that are expected by its advocates. Another adverse argument is that such a customs union would oblige Great Britain to establish a tariff upon food products in the interest of her colonies and this would seriously affect the cost of production of her manufactures, for it is estimated for instance, that from the United States alone England imported over \$500,000,000 worth of commodities in 1896, most of them being food products. It would seem that Great Britain cannot meet the demands of her colonies without sacrificing a part of her foreign trade. Thus, in order to take advantage of the preferential tariff rates offered by Canada, England had to denounce treaties with Belgium and Germany on account of the stipulation in each of their treaties that Belgian and German goods should be subject to no higher duties in the British colonies than those imposed upon the goods coming from the mother country. These treaties expired at the close of July, 1898.

Colonial Trade.—When Mr. Joseph Chamberlain became Colonial Secretary he addressed to all the colonial governors a series of questions designed to show the extent to which foreign competition had made headway during the ten years ending with 1894. The replies received brought out the fact that the most formidable rivals of British trade were the United States and Germany; that in some branches of industry Belgium was a powerful rival and that in the East the competition of Japan was assuming importance. The reason assigned for the displacement of British-made goods was cheapness. Many of the colonies reported that in the first place several classes of articles were better packed and more attractive in appearance than those sent from Great Britain and that in the second place the agents of foreign countries were more energetic. The British government has been taking great pains to promote the trade of British merchants with the colonies, especially since this inquiry into the conditions of the colonial trade was made.

The Government's Efforts to Promote Trade.—The British government makes payments to steamship lines for carrying the mails. The extent of some of these subsidies is indicated in the United States Consular Reports as follows: The Australian service via the Suez Canal costs the government each year about \$436,000; the service to India and China about \$800,000; the New York service about \$420,000; the Canadian-Chinese service \$200,000. These figures show the net loss to the government after deducting the contributions from the colonies and the amount received for postage. Another means adopted by the government for promoting trade is in the contribution of money to technical education. It distributes these funds among the local authorities and attains but a slight control over their expenditure. It is estimated that the government of the United Kingdom annually expends over \$4,000,000 for this purpose. Apparently the funds thus distributed do not secure as good results as where they are directed by a centralized system such as prevails in Germany. They appear to be too widely diffused and are not always applied where they are most needed. The work of technical education however derives some support from the Trade Guilds of London which expend a portion of their revenues for this purpose and in that city technical instruction may be had in a great variety of industrial arts.

Education.—Higher education in Great Britain and Ireland is provided for by a number of universities and colleges, which in 1897 had 1,582 on the teaching staff

and 33,559 students in attendance. An important event in the history of universities during the year was the passage of the Act of Parliament (August 12, 1898) providing for the constitution of the University of London as a teaching as well as an examining body. Secondary education in England and Ireland is unorganized and is largely in the hands of private persons. In Scotland the school boards administer the burgh schools. Statistics in regard to secondary education are imperfect. As to elementary education it was reported that on August 31, 1897, there were 19,958 elementary schools inspected in England and Wales with accommodation for 6,215,199. On December 31, 1897, there were 9,057 elementary schools reported on the rolls in Ireland and of these 8,631 were in operation. The number of pupils on the rolls was 816,000, with an average attendance of 521,141. In Scotland in 1897 there were 3,086 primary schools, with accommodations for 843,769 scholars. In 1894 a royal commission was appointed to inquire into the subject of secondary education. In its report it favored the creation of a department of the executive government in charge of education and the creation of local authority in each county and county burgh with a population of more than 50,000. In July, 1898, an important conference was held on the subject of commercial education at the Guildhall in London for the purpose of discussing means of promoting the study of commercial subjects. On August 1 the Duke of Devonshire presented to Parliament a bill to provide for the establishment of a board of education for England and Wales with a view to centralizing the control of education by uniting the education department and the science and art department under the charge of a permanent secretary. There was much discussion of the relation of the government to education during the year. In the course of a debate in Parliament, Sir William Harcourt declared that the English system of national education was wholly inefficient. Sir John Gorst complained of the early age at which children left school, their irregularity of attendance and the inferiority of the voluntary schools to the board schools. But in spite of the agitation of the subject very little was effected toward the introduction of reforms.

Army.—On January 1, 1898, the distribution of all ranks of the British army was as follows: At home, 99,258; in Egypt, 5,553; in the colonies, 35,003; in India, 74,623. The reserves consist of the following classes: the militia; the yeomanry cavalry; the volunteer corps; and the army reserve force. Including these, the effectives at the beginning of 1898 numbered 665,344. The military estimates for 1898-9 provided for a progressive increase. When this programme is carried out there will be an addition of 16,059 to the regular army, which with the progressive increase provided for in the estimates of 1897-9, will bring the total increase to 25,083. In the Salisbury manœuvres held in 1898 a larger body of troops was engaged than ever before, including 53,600 men.

Navy.—At the beginning of 1898 there were 58 battleships and 8 building; 14 coast defence ships; 89 cruisers and 22 building; 19 look-out ships; 34 torpedo gun boats; 171 torpedo craft and 13 building. This is according to the classification followed by *The Statesman's Year Book*. The following list, taken from *The Statesman's Year Book*, shows the distribution of the vessels in February, 1898:

Mediterranean and Red Sea.....	41
Channel Squadron	15
North America and West Indies.....	15
East Indies	12
China	29
Cape of Good Hope and West Africa.....	16
Pacific	10
Australia	16
South-east coast of America.....	4
Particular Service	12
Surveying Service	7
Training Squadron	4
Total	181

In 1898 Parliament provided for an increase of the fleet by the construction of 7 battleships; 8 armored cruisers; and 12 destroyers.

Finances.—On April 21, Sir Michael Hicks-Beach presented his budget statement. Its showing was very favorable. During the year ending March 31, 1898, there had been an expenditure of £115,089,000, but there remained a surplus of £3,678,000. The increase over the preceding year was chiefly to be found in the customs and excise which afforded a good index to the prosperity of the year. Next in importance among the sources of revenue which yielded an increase, were the death duties and stamp duties, the income taxes and the post and telegraphs. This statement made a profound impression throughout the world as showing the sound and vigorous condition of English finances. For the next year, that is the year ending March 31, 1899

the Chancellor of the Exchequer estimated the receipts at the present rate of taxation to be £108,615,000, while the estimated expenditures fell short of this to the extent of £1,786,000. The existence of this surplus together with the surplus for the year ending March 31, 1898, led the government to propose a deduction of taxation chiefly on tobacco. Another reduction was proposed by a rearrangement of the income tax in such a way that it would bear less severely on persons with an income of from £400 to £700.

It may be of interest here to mention the main sources of revenue and the main items of expenditure in the British budget in reference to their relative importance. The chief source of imperial revenue is taxation which includes seven classes, namely, customs, excise, estate, etc., duties, stamps, the land tax, the house duty, and the income and property tax. From these seven sources 83 per cent. of the entire revenue was derived in the year ending March 31, 1897, and in the budget of the next year and the budget estimate for the year ending March 31, 1899, these classes continue to hold about the same relative importance. Of these seven sources of revenue the most productive has been the excise including the levies on spirits, beer and railways, and license duties. Next in the order of importance have been the customs, the taxable imports being tobacco, which is the most important of all, tea, rum, brandy, other spirits, wine, currants, coffee, raisins, and some other articles, of minor importance. Third in order of importance has been the income and property tax; fourth, the estate, etc., duties, and fifth, stamps. The other sources of revenue are classed under the heads of post-office, telegraph service, crown lands, interest on Suez Canal shares, and miscellaneous. Among the branches of expenditure the most important classes are the national debt services, other consolidated fund services, the army and navy, civil service, customs, and inland revenue services, post-office, telegraph services, and packet services. In the year ending March 31, 1897, the total revenue was £103,949,884, the total expenditures £101,476,669, leaving a surplus on March 31, 1897, of £2,473,215.

Labor Interests.—For some account of the great strikes in the engineering trade and the South Wales coal trade, see the article STRIKES and LOCKOUTS, and for a brief report of the trade union congress at Bristol, see the article TRADE UNIONS, CONGRESS OF. Other important labor congresses held during the year were the Irish Trades Union Congress at Belfast and the annual conference of the Independent Labor party at Birmingham. At the former the factory acts, child labor, the encouragement of home manufactures, the providing of work for the unemployed, the federation of trades unions, the settlement of labor disputes, were among the important topics discussed. The congress lasted from May 30 to June 1 inclusive. The conference of the Independent Labor Party was held in April. The report of its administrative council showed progress. At the meeting any policy which tended toward entangling alliances with political parties having other than socialistic aims was deprecated. As to the movement of wages during the year 1898 it was reported in the British press that agricultural wages had risen, the improvement in the condition of the agricultural laborer being the most marked in the eastern counties. In August, 1898, the labor department issued its fifth annual report. From this it appeared that 1897, like the previous year, was a time of progress and improvement for the working classes and that the wages of labor had steadily risen. See WAGES.

HISTORY.

The Parliamentary Session.—Parliament assembled February 8, 1898. Up to that time the public attention had been largely absorbed in the great engineering strike (see STRIKES and LOCKOUTS). The subjects of the Queen's speech included the revolt in India and the famine and the plague, the question of local government in Ireland, the measures for the increase of the army; and in foreign affairs the treaty of peace between Turkey and Greece, the condition of Crete, the campaign on the Upper Nile, and the economic condition of the British West Indies. The most important legislative measures recommended were for the new system of local government in Ireland, for the increase both in numbers and in efficiency of the army and for the relief of the industries reported to be suffering from depression in the West Indian colonies. There had been some sharp criticism of the government's course in regard to the northwestern frontier of India (see INDIA, paragraphs on History), and it was thought that the opposition would begin its attack at this point, but its spokesman, Sir William Vernon Harcourt, confined himself to somewhat mild comment on the subject. In the House of Lords the policy of the government in India and in China came in for some mild criticism on the part of the Liberal leader, Lord Kimberley. It was suspected that Great Britain was showing a lack of firmness in breaking her treaty rights. On this point Lord Salisbury said that the policy of the government was not at all likely to lead to the loss of any existing treaty rights, but on the contrary to the gain of new ones. As to Ta-lien-wan, England had not insisted on having that port turned into a treaty port on account of the embarrassment in which such a course would have involved the Chinese government, but Russia had given an assurance that she would throw open to British commerce

any port that she might require. A similar assurance had also been given by Germany which was inclined toward the British policy in respect to open ports. See the article CHINA (paragraphs on History).

An amendment to the address was moved by John Redmond, M. P., to the effect that the local government bill favored by the government in no wise met the demands for an independent Irish Parliament. The discussion of this amendment brought out unfavorable comment from the Liberal side and it was voted down by a large majority. Another amendment was offered by John Dillon, M. P., for the establishment of a Catholic University in Ireland. This measure had been discussed in 1897 and it received the support now, as formerly, of William E. H. Lecky, the historian, Member of Parliament for Dublin University, and the Hon. A. J. Balfour. It was declared that Ireland labored under great disadvantages in respect to the higher education and that existing institutions of higher learning had features which made them obnoxious to the Catholics. The measure had received the approval of the Archbishop of Canterbury, who declared that a majority of the clergy and bishops of the Anglican church were heartily in its favor. Another amendment was offered in the interests of the British manufacturers who were clamoring for some measure that would guard them against German competition in the home markets. Its advocates pointed to the stimulus which foreign governments gave to trade by means of bounties and tariffs and the relative disadvantage of the position of the British merchants in this respect. Countervailing duties were recommended as the only practicable remedy for this state of things. In opposition to this it was urged by the government that in spite of the foreign competition British foreign trade was in fact healthier than before; that Great Britain would have nothing to gain by abandoning her free trade policy, but that there had been some efforts made to induce foreign powers to cease granting sugar bounties and to secure better freight rates for English goods over German railways. These amendments were successively rejected and the Queen's speech was accepted as it stood.

Local Government Act.—The local government bill which was introduced on February 21 made rapid progress. Its main provision was the establishment of elective bodies in place of the existing nominated bodies to carry on local government. These bodies are the County Councils, Urban and Rural District Councils, and Boards of Guardians, whose members were thenceforth to be chosen by electors qualified to vote for Members of Parliament with the addition of peers and women. The qualifications for membership were the same as in England, except that ministers of religion were not eligible. The County Councils alone collect the rates and control expenditures. In addition to these fiscal duties the administrative duties of the old county bodies were transferred to the new, while the judicial functions were given over to the county courts. As to the amount contributed by the imperial treasury to the county it was provided that this should consist of a fixed sum equal to half the county rate and half the poor rate levied on agricultural land in a standard year.

The change from the nominating to the elective system gives a strong democratic character to the measure. It permits the Irish localities to manage their own affairs by means of elective county bodies. This had for more than ten years been the policy of the Liberal Unionists and it naturally received the support of the Irish members who, though not satisfied with all its provisions, regarded it as a step in the right direction. While it was not a substitute for the wider plan of an independent Parliament for Ireland, it was in no way inconsistent with that plan. The principle on which it is based is the principle of local government, which could be heartily supported by all Liberals. But it was not local government in the sense that all the inhabitants of the locality should have the right to an equal voice in the management of its affairs for the measure gave the control of the local expenditures to those who paid the largest share of the local taxes and under present conditions in Ireland, this class constitutes but a small proportion of the population. It has been estimated that about one-half of the revenue is drawn from hardly more than 10 per cent. of the population. All the Liberal factions, together with the Irish members, were ready to accept the bill in principle. It was one of the most important measures which the government had introduced in a long time. As it was under consideration for a considerable period there was a chance to give it great publicity and to profit by the discussion which it aroused throughout the country. In this way valuable suggestions were received and many of them were incorporated by the framers in the details of the bill. It passed its second reading without a division on March 21, 1898.

The Benefices Act.—On March 3, Mr. Balfour introduced for the government the Benefices Bill which had to do with the transfer and exercise of church patronage. Its aim was to lessen the chance for the appointment of unfit persons to ecclesiastical offices. On April 1 it was reported with amendments by a standing committee on law to which it had been referred. In the course of the discussion upon the measure Sir William Vernon Harcourt referred to the ritualistic practices in the Church, stating that there were grounds for the belief that there existed in the Church

of England a conspiracy for the purpose of overthrowing the beliefs of the English Reformation. He held that those priests who practiced rites and taught doctrines which were wholly at variance with the principles of the Church had committed perjury, and he asked whether the institution to a benefice ought not to be refused to such priests on that ground. He said, therefore, that it was the duty of the House to frame the act in such a manner as to prevent this gross violation of their oaths on the part of the clergy. To this Mr. Balfour retorted that it seemed unwise to oppose the measure merely because it did not embrace all possible reforms, when it did include some desirable improvements. Among the amendments proposed was one moved by Mr. Samuel Smith, on June 21, empowering a bishop to refuse to institute to a benefice any presentee who within five years just preceding had taught doctrines inconsistent with the Thirty-nine Articles, or practiced rites not authorized by the Book of Common Prayer; and he argued it was the duty of Parliament to prevent the corruption of the church by the introduction of these practices. It was said by Sir William Harcourt that thousands of the ordained clergy were deliberately plotting the overthrow of the law of the Church of England; that Protestant children were taught lessons wholly inconsistent with the religious views of their parents, and that members of the clergy were leading lives of deception, and concealing whenever the occasion demanded, their real views from the authorities. On the other hand, in the course of the discussion it was by some flatly denied that the bishops were favorable to such practices, and by one member Mr. Smith's amendment was characterized as an attempt to gain popularity by raising the cry of "No Popery again." This amendment was lost by a majority of 215 to 103. At its third reading, June 28, Sir William Harcourt made another speech which attracted wide attention. He referred to the inconsistency of the measure in excluding from the abuse which it sought to prevent the misconduct of clergymen in respect to practices and doctrines. On the other hand, Mr. Balfour held that the practice to which the opponents of the measure referred, did not properly fall within the scope of the bill. He admitted that such practices were illegal and injurious, but he deprecated any action which would tend to make the attitude of the church intolerant towards minor divisions of opinion on the part of members of its clergy. See ENGLAND, CHURCH OF.

The Vaccination Act.—The law regulating vaccination contained some rigorous provisions and there was much irregularity in its enforcement. Some officials did not proceed against those who violated the law, while others were zealous in carrying out its provisions. Of late years there has been strenuous opposition to vaccination in Great Britain and an anti-vaccination league has been formed. Some modification of the law was favored even by those who wished to have vaccination enforced, because without such modification it seemed impossible to prevent evasions of the existing statute. The report of a royal commission, which had been appointed to investigate the subject of vaccination, was published in 1896. This recommended, among other things, the provision that calf lymph should in all cases be used, that the infliction of repeated penalties upon those who persisted in avoiding vaccination should be abolished, that the period within which vaccination must take place should be extended from three months to six months from birth and that objectors to vaccination should be exempt from penalties if they satisfied the local authority that they really believed vaccination would be injurious to the subject or if they made a statutory declaration before a magistrate. The frequent evasions of the existing law as shown by the large increase in the number of the unvaccinated, led to the introduction of a vaccination bill in March, 1898. This embodied many of the recommendations of the royal commission. The act as finally passed included the following provisions: Glycerinated calf lymph was to be used; domiciliary vaccination was to be substituted for the system which required the attendance of persons at public stations; and those opposed to vaccination on conscientious grounds were exempted from penalties. When the measure was introduced it did not contain this last provision; but required the vaccination of all children and imposed penalties upon the parents if they failed to obey the law. An amendment was proposed permitting the parents to obtain an exemption from the penalties by declaring publicly their objection to submitting their children to vaccination. The medical practitioners generally opposed the adoption of this amendment. It was accepted in the House of Commons, however, and pressure was then brought to bear on the Lords to assert their independence and reject the amendment. This the House of Lords actually did, but when the bill was sent back with the amendment for the second time they gave way and accepted it in the form in which it passed the Commons. The bill received the royal assent on August 12 and went into effect on January 1, 1899.

Other Parliamentary Topics.—Among the important measures passed during the session were the Colonial Marriages Act, establishing the validity of a marriage with a deceased wife's sister which had been validly contracted in any British colony; and the Criminal Evidence Act, enabling all persons charged with an offence, together with the wives or husbands of such persons, to give evidence for the defence. The subject of old age pensions was much discussed, the matter having been laid before a

committee for consideration. The committee could not agree, however, upon any old age pensions scheme which it was willing to recommend to Parliament.

An administrative measure of importance was the final adoption of the Imperial penny postage plan. It was announced by the Postmaster-General on July 12 that the rate of letter postage would be reduced to 1d, per half ounce between the United Kingdom, Natal, Newfoundland and any of the other crown colonies that might choose to adopt it. On December 25 it was announced by the same authority that this reduction would take place throughout all parts of the empire with the exception of Australasia and Cape Colony (the latter not having yet notified the home government of its acceptance of the agreement).

The Fashoda Affair.—For an account of the Egyptian campaign and the battle of Omdurman, see the article EGYPT. General Kitchener was rewarded for his services by the title of Lord Kitchener of Khartoum and Aspell. After he had settled affairs at Fashoda he returned on a visit to England. In London he received an enthusiastic welcome and at a ceremony in Guildhall, at which the most distinguished statesmen of the country were present, he was presented with the freedom of the city. At the Guildhall banquet on November 5, a high tribute was paid by Lord Rosebery to the army and its leader, and the campaign just closed was declared by him to be the most brilliant in the military history of Great Britain. It wiped out, he said, the "bloodiest and most barbarous tyranny in the history of mankind." Lord Salisbury's toast was received with the greatest enthusiasm. In it he made the important statement that he had received from the French ambassador that afternoon the information that the French government had concluded that the occupation of Fashoda was of no sort of value. He said they had done what he believed every government would have done in the same position, namely, resolved that the occupation must cease. On this point he said in conclusion, "I must not be understood as saying that all causes of controversy are removed. That is not so. Doubtless there will be many discussions between us but a somewhat acute and somewhat dangerous cause of differences has been removed." On the same day (November 5) it was reported that Captain Baratier, the comrade of Major Marchand, who had returned to France at the same time that General Kitchener made his visit to England, had arrived at Cairo with confidential instructions from the French government to Major Marchand and it was given out that the government had resolved not to retain the Marchand mission at Fashoda, having reached this decision after exhaustive examination of the question.

Lord Salisbury's Address on Nov. 9.—Some surprise was felt when in spite of the closing of the Fashoda incident Great Britain continued her naval and military preparations. To some it seemed as if this was preliminary to the declaration of a protectorate over Egypt and every one looked forward to the Lord Mayor's banquet on November 9, which was to be the occasion of a speech from Lord Salisbury. The speech, however, did not make any definite announcements of a change of policy in Egypt, although it hinted at the government's determination on such a change in certain circumstances. As to the preparations for war Lord Salisbury said that although the immediate necessity for them had passed away, it was not possible to stop them at a moment's notice. They did not denote a desire for war on Great Britain's part, but merely a wish to be fully prepared in case danger should threaten. The Premier referred in his speech to the assassination of the Empress of Austria and announced that Great Britain had agreed to take part in a conference to decide upon measures for the repression of anarchy. He also spoke of the successful settlement of the Cretan question, paying a high compliment to the admirals who, he said, had successfully accomplished what the cabinets of Europe had been unable to do. Upon his mention of the rumor in regard to the supposed design of the government to declare a protectorate over Egypt, there was a burst of applause from his listeners, but he went on to say that he could not pronounce definitely on that matter, although he would not deny that England might be forced by others into a position which she did not at present occupy. He hoped it would not be necessary, however, to modify her present position since the change might endanger the peace of nations. He commented on the entrance of the United States as a new and powerful force in European politics and he held this to be a very serious matter and not conducive to peace, although likely to conduce to the interests of Great Britain. His speech was inconclusive in tone but contained certain dark and mysterious hints as illustrated in the following sentence: "We see nations decaying whose government is so bad that it can neither maintain the power of self-defence or retain the affection of its subjects and when this occurs there are always neighbors impelled by some motive—it may be the highest philanthropy or it may be the natural desire of Empire—to contest as to who shall be heir to the falling nations; that is the cause of war."

As to the Czar's famous appeal for disarmament the Premier expressed the heartiest sympathy with his motives but declared that Great Britain must still provide precautions needful to counteract the dangers surrounding her.

French Opinion of the Egyptian Question.—In France the importance of General Kitchener's victory was fully appreciated. There the battle of Omdurman was reckoned as one of the great battles of the age, and due honor was rendered to

Kitchener for his ability and foresight. It is interesting to note the attitude of prominent French writers toward the Fashoda affair. At first it was thought that the Europeans, whom the Sirdar had heard of in Fashoda, might be an expedition of the Belgians or of the Abyssinians. When it was known that it was really the mission of Marchand there was considerable excitement on both sides of the Channel, but the English press took the matter far more seriously than the French. The French complained of the fierce tone of the English press and attributed it to a deliberate intent to drag the two countries into war. The tone of the French press was self-restrained and its writers took a favorable view of the prospect of amicable adjustment. Meanwhile the members of Marchand's force maintained the most courteous and friendly relations with the English invaders. Nevertheless, in France the attitude of England occasioned alarm. It seemed to assume beforehand that the question could be decided in but one way, and that threats rather than diplomatic negotiations were the most promising means of securing an adjustment. To the French it seemed that the whole question of Egypt was to be opened anew. They pointed to the fact that when the expedition started for the Soudan the English newspapers declared that Egypt had organized it and that England really had no interest in it, and yet when the expedition had attained its end, these same writers boasted that success was due wholly to English officers, English troops and English money.

Here is a specimen of the way prominent French writers viewed the Egyptian question. The acts of Great Britain in connection with the Egyptian affair had, it was said, been wholly inconsistent with their words. By the French it was held that the time had now come for England to throw off her mask and assume responsibility for her acts. For sixteen years she had exercised over Egypt a kind of protectorate which had all the advantages and none of the disadvantages of actual possession. Egypt swarmed with her functionaries who, although they had no doubt done the country some good, had proved an expensive charge upon the Egyptian government. England had restored order in Egypt, but only through an army of occupation whose maintenance was costly to the natives. If she had reconquered the lost provinces of the Soudan it was due, said the French, less to consideration for Egypt than to her desire to avenge the death of Gordon and the repulse of General Wolseley. In short, all that England had done for Egypt had been done wholly in her own interest. It was furthermore believed in France that from the day on which the English entered Egypt in 1882, they had intended to remain. It was on account of this well-known intent that Cecil Rhodes had dreamt of an African Empire which should extend from Alexandria to the Cape, a dream which the taking of Omdurman now promised to render possible of realization. The assertions of English statesmen in regard to Great Britain's Egyptian policy were not, in the opinion of the French, worth the paper on which they were written. Fully persuaded that England intended to retain Egypt, they asked only on what terms they proposed to maintain their control. See FRANCE (paragraphs on History).

Sir Edmund Monson's Speech.—A good deal of excitement was caused on both sides of the Channel by a speech of Sir Edmund Monson, the British Ambassador to France, at an annual dinner held on December 6, at the British Chamber of Commerce, Paris. This speech was characterized as a venture in the "new diplomacy." It referred very pointedly to the existing situation and in the course of it the speaker seemed to throw aside the usual diplomatic reserve. There had been signs of an intention on the part of France to attempt a sort of rivalry with England in Egypt. At least this construction was placed by the English upon a proposal which apparently met with the approval of the French government, that French schools should be established at Khartoum, thus indicating that France intended to foster French influence in that region. Whether this was intended as a test of British feeling on the subject or was seriously contemplated by the government cannot be said. But if it sprang from the former motive it succeeded in evoking a very decided expression of opinion. Sir Edmund Monson gave warning that Great Britain would not go beyond a certain point in her concessions, and that it was advisable for France to desist from her policy of "pin pricks" which would necessarily result in a serious irritation of Great Britain. He disapproved of those petty manoeuvres of the French toward thwarting British influence or rivaling British enterprise in Egypt. This speech seems to have been in line with the views of prominent British statesmen expressed several times in the course of the year, as, for instance, in the speeches of Sir Michael Hicks-Beach, Mr. Chamberlain, and Lord Rosebery, but coming at such a time it naturally provoked sharp criticism. The tone of the British press was distinctly disapproving, and in France it was regarded as a further humiliation of the republic and another instance of the aggressive spirit of Great Britain. But while the general tone of the French press was resentful, there was evidence that the proposal in regard to the schools was a merely tentative one.

Settlement of the Fashoda Dispute.—In the latter part of December the British government received the news that Major Marchand had withdrawn from Fashoda

MAJOR-GENERAL HERBERT KITCHENER.

and retreated into the interior of Africa. Lord Salisbury had previously notified the French government that until this was done there could be no negotiations for the settlement of the African dispute. The way for such negotiations was now clear and on December 27 the British Premier proposed to the new French Ambassador, M. Paul Cambon, a joint commission for the delimitation of the frontiers. In his note, however, Lord Salisbury lays down part of the frontier and claims for England a sphere of influence including Bahr-el-Ghazal, Darfur, Borgu, and the region extending to the east shore of Lake Tchad. Between the French and British territories he proposes a line drawn westward from the watershed of the Ubangi, leaving to France the lands to the south and west of that line.

Rumors of Cruelty Toward the Dervishes.—The battle of Omdurman was followed by rumors of British atrocities toward the conquered dervishes that threatened to cause a scandal. A war correspondent declared that the treatment of the wounded dervishes was brutal in the extreme; that many of them were slaughtered in cold blood by their conquerors, and even when they were utterly unarmed. He admitted that in some instances it was fully justified, for the wounded dervishes were known to be dangerous, and there were many cases of the shooting of British soldiers, often in treacherous circumstances by the wounded men whom they were approaching. In many cases, however, he said, it was wholly unnecessary. He said, moreover, that the wounded were left for several days without aid and lay in the heat of the August weather, tortured by fever and thirst. He also charged the British troops with having pillaged the surrendered city and of desecrating the Mahdi's tomb. Women and children were shot down by the maxim guns which were fired into the midst of crowds of non-combatants. These statements and similar stories were, however, emphatically denied by others who had been present at the battle, and at Omdurman after it was captured. Nevertheless there was much excitement over the matter.

The Liberal Leadership.—In a letter to Mr. John Morley which was published on December 13, Sir William Vernon Harcourt resigned his position as leader of the Liberal party, saying that "a party which is rent by sectional disputes and personal interests is one which no man can consent to lead with credit to himself and advantage to the country." There had been for some time signs of a division in the Liberal party and some of its members have favored the return of Lord Rosebery to the leadership. Besides Rosebery the names most generally mentioned in connection with the succession to the leadership were Sir Henry Campbell-Bannerman, Sir Edward Grey and Mr. Herbert Asquith, but at the close of the year 1898 the question was still unsettled.

GREAT TELESCOPE. (PARIS EXPOSITION.) See ASTRONOMY.

GREECE. A country of Europe occupying the most easterly of the three large peninsulas that project into the Mediterranean Sea, has an area of about 25,014 sq. m., with a population in 1896 of 2,433,806. Its capital is Athens with a population in 1896 of 111,486. The main occupation is agriculture, which, however, is not well developed on account of the primitive methods employed, although the soil is unusually fertile. Farming is chiefly in the hands of peasant proprietors and the large landed proprietors are comparatively few. Of the cereal crops wheat is the most important, the average annual yield being seven million bushels. But barley, rye, maize and mezlin are also raised. Of fruits the most successfully cultivated crop is that of currants. The raising of olives and the culture of the vine and the silk-worm are also important. As to the mineral wealth, manganese, iron ore, hematite, zinc ore, speiss, silver lead and lead ore, galena, etc., are found in the Laurium district and among other minerals worked are magnesite ore, silicate of magnesia, barytes, sulphur, emery and gypsum. The manufactures are unimportant, but include the manufacture of engines, leather, thread, cloth, glass and flour.

Commerce.—In 1897 in spite of the war with Turkey, which impeded trade during the first half of the year, the exports from Greece were valued at \$15,581,676, an increase over 1896 of \$1,519,613, which was due chiefly to the increase in the exports of currants. The imports into Greece during the year 1897 were \$22,148,975, also an increase over 1896 of \$223,284, chiefly due to the increase in the imports of cereals. In connection with a proposal for a direct line of steamship from the United States to ports of the eastern Mediterranean, a Consular Report was submitted in 1898 on the subject of the trade of the United States with Greece. It appears from this that there has been a tendency towards an increase of trade, but that it was checked somewhat by the war with Turkey in 1897 and the war between the United States and Spain in 1898. Greek groceries and other products are said to be exported in increasing quantities to the United States. The establishment of direct steamship communication was expected to result in a great increase of trade between the two countries for Greece imports in large quantities classes of goods which can be produced advantageously and cheaply in the United States.

Finance.—By the terms of the treaty of peace with Turkey in 1897 Greece agreed to pay an indemnity of \$20,000,000, and as a guarantee for its payment accepted the

control of her finances by an international commission. Representatives of the six mediating powers constituted this commission and to it have been assigned the following revenues: monopolies, tobacco tax, stamps and the Piræus customs, as security for the loan which the government was authorized to raise. The revenues from these sources were estimated for the year 1898 at 39,600,000 drachmæ and supplementary revenue valued at 7,200,000 drachmæ was assigned from the customs in case of a deficiency. The total revenue for 1898 from all sources was estimated by the commission at 85,556,000 drachmæ and the expenditure at 63,251,000 drachmæ. The principal sources of revenue are the customs and excise, direct tax, stamps and dues and monopolies and the heaviest branches of expenditure are the service of the public debt and the ministries, army and the interior. The public debt was estimated on January 1, 1897, at 656,028,888 gold drachmæ and 168,645,543 paper drachmæ. It was estimated that the amount necessary to pay the indemnity meet the needs of the treasury and redeem the floating debt was 123,152,000 gold drachmæ.

Army and Navy.—All able-bodied males 21 years of age are liable to military service. The events of 1898 revealed the fact that the Greek army was much stronger on paper than in reality. It was ill-disciplined and badly officered. On a peace footing the nominal strength of the army in 1896 was 25,333 officers and men, which on a war footing could be raised, it was said, to 82,000 men. There is also a territorial army whose numbers are estimated at 96,000 men. The navy consists mainly of 5 armor-clads with a personnel of about 3,165 men. The war of 1897 proved it to be less efficient than had been expected, for it was for the most part inactive and accomplished little.

Government and Political Parties.—Greece is a limited monarchy, the executive authority being vested in the King and the legislative in a single chamber known as the Boulé, which meets annually and comprises 207 representatives elected for four years by manhood suffrage. There is a ministerial council consisting of the President and the Ministers of Interior, Finance, Justice, Marine, War and Public Instruction. The religion of the State is the Greek Orthodox Church, but there is complete freedom of worship guaranteed to all subjects. The King, George I., together with his ministers, incurred unpopularity on account of the reverses sustained by the Greek arms in 1897. M. Delyannis, one of the most prominent statesmen of Greece and several times Premier, was dismissed from office by the King in April, 1897, on account of the popular feeling against him in consequence of the war. He was succeeded by M. Ralli, who held office until September 30, 1897, when M. Zaimis formed a cabinet which remained in office until November 7, 1898.

HISTORY.

The war between Turkey and Greece lasted barely a month, but peace negotiations were prolonged for seven months. The preliminary treaty was signed on September 18, 1897, but the final treaty was not signed until December 4. It was ratified two weeks later by the Sultan and after having passed the Greek Chamber received the approval of the King. It is a lengthy and very detailed instrument. The most important points in it are as follows: The Greek frontier was rectified in the interests of Turkey, the latter power acquiring important strategic advantages. The delimitation of the frontier was placed in the hands of a commission consisting of representatives from the two governments, and of delegates chosen by the ambassadors of the mediating powers. Greece was required to pay an indemnity amounting to about \$17,600,000 in our money, also to pay the arrears of interests on her bonds. As a guarantee for the war indemnity and the interest on the debt an international commission, consisting of six representatives from the mediating Powers, was to have control of such a portion of the Greek revenues as were required for meeting the above mentioned obligations. As soon as the Powers should declare that the conditions of the treaty had been fulfilled Turkey was to evacuate Thessaly. The minor points of the treaty were concerned with the exchange of prisoners of war, the granting of amnesty to persons interested in the war, the indemnification by Greece of certain private persons for losses during the war, a mutual concession of the right of residence in each country to the inhabitants of the other, the resumption of postal and telegraphic relations, etc. It is a very significant thing that the Cretan question, which was the main cause of the war, received no notice whatever in the treaty.

It seemed to be the common opinion that Greece had fared as well by this treaty as she had a right to expect. Public opinion in foreign countries seemed on the whole unsympathetic toward Greece in her defeat. She had complicated the Turkish difficulty. She had added to the prestige of Turkey as a military power, and had checked the efforts of foreign powers to enforce reforms upon the Porte.

When the terms of the treaty were known in Greece much public discontent was shown. The government was attacked vigorously in the press and on February 26 an attempt was made to assassinate King George. He was returning from a drive to the Phalerum with his daughter, the Princess Marie, and when a short distance from

Athens was fired upon by two men by the side of the road. One of the shots wounded the King's footman, but further than this no harm was done. The murderers ran away, but were soon captured. No others were found to have been involved in the conspiracy, though it was reported at first that the murderers were members of a secret club which had been formed for the purpose of assassinating the King. The effect of this cowardly attempt was to bring back to some extent the loyalty of King George's subjects. He was greeted with shouts and cheers by the crowd and a *Te Deum* was sung in the Cathedral the next morning. The terms of the treaty required that the Turkish troops should be withdrawn from Thessaly within a month after the loan for the payment of the Turkish indemnity had been satisfactorily arranged. Owing to a delay in settling upon the details of the loan the Turkish evacuation did not take place until the summer. On June 6 it was announced that all Turkish troops had been withdrawn and that the Greeks had occupied Thessaly. Early in the session of the Chamber the bill providing for the international control of the finances was passed. The session was closed in April after authorizing the issue of the loan. On November 7 the Zaimis Cabinet resigned, anticipating hostilities from the new chamber, but M. Zaimis, at the desire of the King, formed a new cabinet. The opening of the Chamber was postponed from November 12 to November 27. The programme of M. Zaimis comprises many reforms, including the increase of the police force, the reorganization of the army, the introduction of technical education, improvements in the system of taxation and the recommendation of a more stringent press law. See ARCHÆOLOGY.

GREEK ARCHÆOLOGICAL SOCIETY. See ARCHÆOLOGY (paragraph Greece).

GREEK CHURCH in the U. S. consists of two divisions: the Greek orthodox, with 4 ministers, 3 churches, and 5,030 members; and the Russian orthodox with 39 ministers, 29 churches, and 43,000 members.

GREEK LITERATURE, MODERN. *History.*—The war against Turkey naturally had a prejudicial effect upon literary production in 1898. There are however a number of historical works which deserve mention, and first in importance is a *History of the Empire of Nicæa and the Despotism of Epirus (1204-1261)*, by Anton Miliarakis, already favorably known for his works on geography. The *History of Trebizond from the Earliest Times to our own Days*, by Tryphon Evangelides, is also a useful work, containing much new material, but is lacking in method. A *History of Nauplia from the Oldest Times to the Present Day* by Michael Lambrynides, is praiseworthy as a pioneer work, although it shows the author's lack of preparation. A volume of political, as well as historical value is *Foreign Rule and Kingship in Greece, (1821-1897)*, by George Philaretos, the former Minister of Justice who endeavors to prove that Kings Otto and George have both been used as fools to satisfy the interests of foreign powers.

Poetry and Fiction.—Among books of poetry may be mentioned *The Grave*, by Kostis Palamas, which is the lyrical and somewhat mystical tribute of a father to a well-beloved son, and *Songs of the Desert*, by Konstantin Hatzopoulos, who writes under the pseudonym of "Petros Vassilikos," and who here as elsewhere reveals his keen delight in nature. Among writers of fiction should be mentioned Kostas Passajannis and Eugenie Zographu, who have both produced some readable short stories. A more pretentious effort is *The Dream of Jannaris*, a love story, written in the popular dialect, but somewhat lacking in action. The author is Johann Pyscharis, a professor of Modern Greek at Paris.

GREEN, JOSEPH F., Rear-Admiral (retired) U. S. N., died in Brookline, Massachusetts, December 9, 1897. He was born in Maine, November 24, 1811; became midshipman in 1827, lieutenant in 1838, commander in 1855; and captain in 1862. In the Mexican War he participated in all the important operations along the Pacific coast; during the Civil War was on blockading duty and took part in the bombardment of Fort Wagner. He was promoted to the rank of commodore in 1867, to that of rear-admiral in 1870, and was retired the following year.

GREENLAND, a region whose northern limits have not been defined, lies to the northeast of America and has an estimated area of 46,740 sq. m., with an estimated population in 1890 of 10,516 gathered in the towns and settlements along the coast. The interior is not habitable. Greenland is a colony of Denmark and the trade is a monopoly of the Danish government. In 1896 the exports were 406,000 kroner, and the imports 557,000 kroner, the chief export trade being in whale and seal oil, the skins of the seal, reindeer and fox, cryolite, and eiderdown. For an account of the recent exploring expeditions which have entered Greenland or passed along its coast see the article ARCTIC EXPLORATIONS.

GREGORY, Sir CHARLES HUTTON, K. C. M. G. (1883), eminent English civil engineer, died January 10, 1898. He was born at Woolwich October 14, 1817. He constructed various engineering works in England and abroad; was at one time presi-

dent of the Institution of Civil Engineers; and was consulting engineer to crown agents for the colonies, and to some colonial governments. In 1894 he married Mrs. Stirling, the well known actress, who died the following year.

GREGORY, JOHN MILTON, LL. D., died in Washington, October 19, 1898. He was born at Sand Lake, New York in 1823; after his graduation from Union College in 1846, he studied law but gave it up for the ministry and later became principal of a school in Detroit. From 1853 to 1858 he edited the *Michigan Journal of Education*; in that year he was elected, as a Republican, State Superintendent of Public Instruction, and was returned to the office for two terms, serving until 1864. He was president of Kalamazoo College for three years, and in 1867 accepted the presidency of the University of Illinois in which position he remained until 1880. Mr. Gregory was United States commissioner to the World's Fair at Vienna in 1873 and Illinois commissioner at the Paris Exposition of 1878; he was also judge in the educational department of the Centennial Exposition at Philadelphia. In 1882, he was appointed by President Arthur a member of the first Civil Service Commission, retiring in 1885. He had travelled widely and was the author of several books.

GREY, Rt. Hon. Sir GEORGE, D. C. L., LL. D., K. C. B., who was styled "the veteran colonial administrator" and "the founder of the British South African Empire," died September 19, 1898. He was born at Lisburn, Ireland, in 1812. He established an excellent record as an Australian explorer and as colonial governor in South Australia, New Zealand and South Africa. In early life he was a captain in the Eighty-third Foot; Lieutenant-Governor of South Australia, 1841; Governor of New Zealand, 1846-54, 1861-67; Governor and Commander-in-Chief of Cape of Good Hope, 1854-61; Premier of New Zealand, 1874-91. He was the author of *Journals of Discovery in Australia* (1841); *Polynesian Mythology and Traditions of New Zealand* (1855); *Proverbial Sayings of the New Zealand Race* (1858). He retired from public life upon leaving the premiership of New Zealand in 1891.

GRIDLEY, CHARLES VERNON, Captain, U. S. N., died at Kobe, Japan, June 4, 1898. He was born at Logansport, Indiana, in 1845; entered the United States Naval Academy from Michigan in 1860, and was graduated October, 1863; served in the West Gulf blockading squadron and later in the South Atlantic squadron. He served on various ships and was successively promoted, reaching the rank of commander in March 1882. He was promoted to the rank of captain in March 1897, and was assigned to the command of the *Olympia*, of the Asiatic squadron; in the battle of Manila Bay May 1, 1898, he commanded this vessel, then Admiral Dewey's flagship. On account of ill health augmented by the Manila expedition, he was ordered home by Admiral Dewey and died on the way. He showed great bravery and ability in the Manila fight.

GRIGGS, JOHN WILLIAM, Attorney-General of the United States, successor to Joseph McKenna in the McKinley Cabinet, was born in Newton, Sussex county, New Jersey, July 10, 1849. After graduation from Lafayette College in 1868, he began the study of law in the office of Robert Hamilton at Newton; removing to Paterson in 1871, he continued his study in the office of Socrates Tuttle and in the same year was admitted to the bar. In 1875 he was elected from Passaic county to the State Assembly, and reelected two years later, but in 1878 suffered defeat. Beginning with 1882 he was State Senator for three two-year terms, in the last of which he was President. Mr. Griggs in 1895 was elected Governor, being the first Republican to hold that office in New Jersey in twenty-five years; his plurality over Alexander T. McGill, the Democratic nominee, was 26,900. Upon the transfer of Mr. McKenna from the Cabinet to the Supreme Court in January 1898, Mr. Griggs was appointed, January 22, to fill the vacancy, the appointment being confirmed by the Senate three days later. Since there is no Lieutenant-Governor in New Jersey, the governorship devolved upon the President of the Senate, Foster M. Voorhees, who assumed the title of acting Governor on February 1. In the November elections of 1898, Mr. Voorhees was chosen Governor for the regular term, on the Republican ticket. Mr. Griggs is president of the Paterson National Bank and of the Paterson Safe Deposit Company.

GRIPPE. See EPIDEMIC INFLUENZA.

GROSS, Rev. WILLIAM HICKLEY, D. D., Roman Catholic Archbishop of Oregon, died in Baltimore, Maryland, November 15, 1898. His family came to America from Alsace in the latter part of the last century. Bishop Gross was born in Baltimore June 12, 1837; after studying at St. Joseph's College he entered the novitiate of the Redemptorist order in 1857 and in 1863 was ordained to the Priesthood. During the Civil War he ministered to the sick and wounded; he engaged in mission work in New York for about five years and in 1871 was sent to Boston to continue the work in that city. In this work he seems to have been eminently successful; in Boston he became Superior of the Redemptorists. He was appointed in 1873 to succeed Bishop Persici, of Savannah, Georgia, and was consecrated on April 27

of that year. Upon the resignation of Archbishop Seghers, of Oregon, the Holy See chose Bishop Gross to fill the vacancy.

GUADELOUPE, a French possession east of the Caribbean Sea, comprising two islands separated by a narrow channel, has a total area together with its dependencies, of 583 square miles and a population of about 167,000, including 15,000 coolies. The dependencies are the small islands Les Saintes, Désirade, St. Martin, Marie Galante, and St. Barthélemy. The principal town is Pointe-à-Pitre (pop. 17,100). The colony, which is represented by a senator and two deputies, is managed by a governor and elective council. In 1897 the debt was 1,000,000 francs, and the revenue and expenditure balanced at 7,120,000 francs (\$1,393,460); the expenditure of France, according to the budget of 1898, was 1,652,000 francs (\$318,836). The chief product is sugar, coffee, and cacao ranking next; other products are bananas, sweet potatoes, maize, tobacco and vegetables. In 1896 the imports amounted to 21,762,773 francs, (\$4,190,215), and the exports to 18,713,095 francs (\$3,627,241). There are 97 elementary schools with about 11,000 pupils, and a lyceum with 350 students.

GUAM, the southernmost, largest, and most populous of the Ladrões (q. v.) or Marianne Islands belonging to Spain, 1,500 miles east of the island of Luzon in the Philippines and 1,350 miles south of Yokohama. It is about 30 m. long and from 3 to 10 m. wide. The population in 1887 was 8,561, but is now estimated at 10,000. In the north the surface is level and barren; in the south it is uneven and of volcanic tition. The southern portion is the best watered and the most fertile. The soil is clayey. The chief products are rice, sugar, cocoa and indigo. A coral reef surrounds the coast, which it renders inaccessible in the northeastern portion, but channels divide it on the other sides of the island. On the western coast are the small harbor of Caldera de Apra, the bay of Umatak, and the town of Agaña, the capital of the island, which is fortified, and has a population of about 3,000. During the war between the United States and Spain, Guam was captured by Captain Glass, commanding the United States cruiser *Charleston*. The latter entered the harbor of San Luis and a landing was effected on June 21. The Governor-General and other officials were taken prisoners. There was only a handful of troops on the island, and the attack was wholly unexpected, the inhabitants not even knowing that war had broken out between the United States and Spain. The treaty of peace surrendered Guam to the United States. On December 23, the *Bennington* was ordered from Honolulu to Guam to take possession of the property formerly belonging to the Spanish crown.

GUATEMALA, a Republic of Central America, comprising 22 departments, whose aggregate area is estimated at 63,400 square miles, and whose population, according to the census of 1893, is 1,364,378, of whom about 60 per cent. are Indians and the greater part of the remainder mixed bloods. There are very few inhabitants of pure Spanish descent. The capital is Guatemala le Nueva, which has about 65,000 inhabitants, over 60 per cent. of whom are of European extraction; the other more important cities are Totonicapan (pop. 40,000), Quezaltenango (30,000), Coban (27,700), San Marcos (16,000).

Government.—The Republic was established in March 1847. By the Constitution, which was adopted in 1879, and modified in 1885, 1887, and 1889, the chief executive authority is vested in a President, who is elected for six years and who is ineligible for the succeeding term. The executive functions are exercised through a cabinet of six departments, namely, Foreign Affairs, Hacienda and Public Credit, Government and Justice, Fomento, War, Public Instruction. The President in 1898 was Don Manuel Estrado Cabrera. The legislative authority devolves upon a House of Representatives, the members of which are chosen in the proportion of one for each 20,000 inhabitants for a period of four years, by popular vote. There are justices of the peace in all the municipalities, 26 courts of first instance, 6 courts of appeal, and a Supreme Court. In 1896 the regular army consisted of about 7,000 officers and men. The effective army, composed of men from 18 to 30 years of age, is said to number 56,900; and the reserve, composed of men from 30 to 50 years of age, is placed at 30,000. About one-tenth of the public expenditure is used for the army.

Finance.—Revenue and expenditure in pesos have been:

	1894.	1895.	1896.
Revenue	11,851,026	14,491,667	15,150,741
Expenditure	13,577,034	15,515,081	17,437,452

The revenue is derived mainly from customs and taxes on alcoholic liquors, tobacco, etc.; the expenditure is chiefly for public debt, war, and public instruction. The outstanding external debt in 1897 was £2,009,815 (about 22,448,620 pesos); the internal debt was 7,319,955 pesos. There are six banks of issue. According to the quarterly estimate of the Director of the United States Mint, the value of the peso

on October 1, 1898, in United States currency was \$0.436. The currency of the country is mostly paper, the value of the paper peso being about equal to that of the silver.

Industries and Commerce.—The country is essentially agricultural, the soil being for the most part very fertile. The principal exports are coffee (over 22,340,000 pesos in 1896), bananas, hides, and rubber; other important products are sugar and cereals. The imports in currency for 1896 are stated to be 26,287,145 pesos and the exports 23,085,544. The foreign trade is carried on chiefly with the United States, Great Britain, Germany and France. Among the principal imports are textiles, tools, and machinery. Various minerals are found, but hitherto have been little worked; among these are gold, silver, copper, tin, lead, salt, and sulphur. There are some fairly prosperous manufacturing interests, including woolen and cotton mills, plants for cement, earthenware, etc., cigar factories, sugar mills, breweries, etc. It is said that agricultural and commercial conditions have of late been apparently very prosperous; but it seems that the country does not reap the benefit, for there has been a series of annual deficits. The reason is perhaps due to the fact that the large coffee plantations are owned by German stock companies and the profits are turned over to non-resident German stockholders. It is said that German property in Guatemala is valued at \$35,700,000, while there are not more than five hundred resident Germans in the country. On August 12, 1898, a decree was issued increasing the import duties, payable in gold or its equivalent in silver, to 30 per cent. The decree contained other claims denoting a general advance in tariffs.

Shipping, Communications.—Some good roads exist in the country, but much traffic is accomplished by pack mules. There are several railroads. Besides the new line connecting Iztapa with the capital, there are the lines connecting the capital with Esquintla and San José, and Champerico, and Retalhuleu and San Felipe, the three aggregating about 150 miles. Other lines are under construction. A subsidy of about \$8,000 a mile is guaranteed by the government. After the assassination of President Barrios in February, confidence was soon restored in the government under Acting President Cabrera. The project of the Northern Railroad had been originated by President Barrios and the road, which was in process of construction at his death, continued in building during the year. A contract between the government and two Americans, Messrs. May and Jekyll, to operate the road, the major portion of which was already completed, went into effect April 15, 1898. About the same time the Acting President was empowered by the National Assembly to enter into a contract with an English corporation known as the Pacific Steam Navigation Company, and the Chilean Compañía Sud Americana de Vapores for carrying mails between Ocos and Chile; the companies were to receive an annual subsidy of \$15,000, or of \$30,000 when the service should be extended to San Francisco. In 1896 the total length of telegraph lines was 2,980 miles, and there were 212 post-offices.

Religion and Instruction.—There is no state religion and all faiths are tolerated, but Roman Catholicism prevails. Education is gratuitous and obligatory. In 1898 the government primary schools numbered 1,266, of which 458 were for girls. The number of pupils enrolled was 75,020, of whom over 64,000 were in attendance. There are also a number of schools for secondary education, normal schools, and schools for special and professional instruction. There is a national library of over 19,000 volumes. In 1896 there were 37 periodicals published, of which 7 were dailies.

History.—The revolt which occurred in Guatemala in 1897 was suppressed by President José María Reyna Barrios by the middle of November. In the previous month the important town of Quezaltenango was retaken by the government party, whereupon the revolt was practically abandoned, although the rebels achieved a few minor successes some weeks later. The rebellion came actually to an end when President Barrios forced the leaders, Generals Morales and Fuentes, to leave the country. They retired to Mexico and thence to San Francisco. Among the rigorous measures taken by President Barrios for repressing the revolt were forced loans from wealthy citizens and business firms. The President did not conduct these financial affairs in accordance with the wishes of a wealthy merchant and well-known financier, Don Juan Aparicio, who refused to respond to the demand for loans and took the side of the rebellion. As a result he was seized by the Military Governor and shot. This execution probably would not have taken place had not Generals Morales and Fuentes persisted in attacking Quezaltenango, where Aparicio was imprisoned. On February 8, 1898, a former employee of Aparicio, Zollinger by name, being determined to avenge the execution, shot President Barrios, and in turn immediately fell under the fire of the President's guards. It was stated that for a long time a reward of \$100,000 had been publicly offered to any one who would assassinate the President. In some quarters it was also thought that Zollinger was the instrument of a secret organization which was aiming to destroy the united action on the

part of the republics, which had shown itself in the formation of the "Greater Republic" and later of the "Republic of Central America." (See CENTRAL AMERICA.) Señor Barrios was succeeded by Vice-President Manuel Estrada Cabrera, who met with little opposition, although some of the leaders made a vain attempt at resistance. Señor Cabrera, on assuming the administration, issued, March 13, a decree of amnesty to all persons driven out during the régime of President Barrios. On September 8, 1898, he was elected President.

GYMNASIA. See MUNICIPAL GYMNASIA.

GYMNOSPERMS. See BOTANY (paragraph Spermatozoids in Gymnosperms, etc.).

GYNÆCOLOGICAL SOCIETY, AMERICAN, organized in 1870. Membership limited to 100 active and 40 honorary fellows. Next annual meeting at Philadelphia, Pa., in May 1899. President, J. T. Johnson, M. D.; Secretary, J. M. Baldy, M. D., Philadelphia, Pa.

GYP SUM. France leads the world in the production of gypsum, with the United States second and Canada third. The producing States in the order of their importance are Michigan, Kansas, New York, Iowa, Virginia, Colorado, and California. The domestic production in 1897 amounted to 224,254 short tons, valued at \$573,344, and the imports were 163,320 long tons valued at \$212,429. Most of the imported material was used for making plaster of Paris, for which it is well suited, but there is a growing application of the American product for this purpose. Professor Lacroix's recent work on the classic deposit of the Paris basin, shows that it is perhaps the richest in mineral of any sedimentary region; in fact, this locality is looked upon by some as the birthplace of modern mineralogy. The gypsum occurs either as crystal or as strata up to ninety feet in thickness, and these beds have for many years furnished the plaster of Paris. Twenty associated minerals are found, and they result often from the alteration of the gypsum.

GYPSY MOTH AND GYPSY MOTH COMMISSION. During the year 1898 the public authorities of Massachusetts were very active in their endeavors to exterminate the gypsy moth. A brief introductory sketch of the origin and nature of this pest may be of interest. The introduction of the gypsy moth (*portheiria dispar*) into Massachusetts in 1868, was an event of not only biological but, as the sequel has shown, great economic importance. It was introduced by Mr. L. Trouvelot, a French artist and scientist, then living in Medford, Mass., in connection with some experiments he was making in the cultivation of various caterpillars for the production of silk. Through an accident some of the insects escaped and Mr. Trouvelot, well aware of their destructive habits, promptly published the fact and warned his neighbors. The gypsy moth is a native of Europe and Asia extending from Spain to Japan, and though a cause of great injury to all sorts of vegetation it is held in check by numerous natural enemies. These, however, are wanting in this country and its unrestrained increase would in a few years result in losses of millions of dollars. It was some years, however, in gaining a foothold in Medford and it was not until 1889 that the caterpillars became so abundant, it was determined to ask the legislature of the State for aid in their destruction. The petition of the town of Medford was supported by the State Board of Agriculture and by scientists generally, and accordingly a special "Gypsy Moth Commission" was appointed by the Governor and \$25,000 was appropriated by the State "to exterminate" the moth. Later in the year this appropriation was doubled. That extermination of the insect was considered feasible was due to certain interesting points in its natural history. The eggs are laid in clusters of several hundred (1,400 have been found in one cluster) on the bark of trees, on fences, walls, stones, etc., often in the most exposed situations. They are mixed with, and well covered by, a mass of yellowish hairs from the abdomen of the female moth, which serve as an effective protection, but causes the eggs-cluster to be conspicuous objects against a dark back-ground. This makes it easy to find and destroy the eggs, during the fall and winter. If not destroyed they hatch in the spring when the leaves are beginning to appear, and the young caterpillars begin at once their destructive work. They are very hardy and grow rapidly. When fully grown they measure over an inch and a half long and a quarter of an inch wide. They are dark bluish-gray in color, with blue tubercles on the front segments and red ones behind, and they are thickly covered with long yellow or brown hairs. As they approach maturity, they are accustomed to crowd together during the day on the underside of large branches or in other sheltered places and feed only at night. This habit has been taken advantage of and actually millions of the caterpillars have been destroyed by tying bands of burlap around the trunks of trees and each day killing the caterpillars which have crawled beneath them. The caterpillars are ravenous eaters and feed on almost anything vegetable, not even pines and cedars being exempt, though fruit and

shade trees are their favorites. The use of Paris green and other insecticides has not been very successful in destroying them as they are able to consume without injury extraordinary amounts of arsenical poisons. They pupate in sheltered places, often large numbers together, each one forming a slight cocoon of silk. The pupæ are usually an inch long or less and of a chocolate or reddish-brown color. At the end of ten days or two weeks the moth emerge. The males are brownish-yellow with dark-brown markings and measure over an inch and a half across the wings. They are active and fly by day. The females are larger (two inches or more) and are yellowish-white with a few black or brown markings on the front wings. They are very sluggish and do not fly at all, but after emerging from the cocoon lay their eggs at that spot or close by. It is due to this fact that the spread of the moth has been confined to such a small area in Massachusetts, and it is on this fact that the best hope of extermination rests. The money appropriated by the legislature in 1890 hardly more than sufficed to make clear the magnitude of the undertaking. The following year the special commission was abolished and the work was put under the control of the State Board of Agriculture, \$50,000 being appropriated for carrying it on. During the year 1898 about 250 men were employed in the work and the district in which the gypsy moth occurred was well mapped out. Up to 1898 the State appropriated \$725,000, and with this sum great progress has been made. During the past year (1898) \$190,000 has been available for the work, so that more has been accomplished than in any previous year. Three hundred men have been employed throughout the entire year and the infested area has been so greatly reduced that only in four towns can the gypsy moth be called common. Since 1891, at least a dozen townships have been entirely cleared and badly infested areas have been reduced from sixteen to four, and it is hoped that a few years more of such work will result in the complete extermination of the pest.

GZOWSKI, Colonel Sir CASIMIR STANISLAUS, K. C. M. G. (created in 1890), a prominent civil engineer and politician, died in Toronto, Ontario, August 24, 1898. He was the son of a Polish nobleman and was born in St. Petersburg, Russia, March 5, 1813. After the final defeat of the Polish insurgents, whose cause he supported, he was exiled to the United States, where he remained four years, and then settled in Toronto. Sir Casimir was made Staff Officer to the Engineer Force in Canada and Aide-de-Camp to the Queen. He was first President of the Canadian Society of Civil Engineers and first Chairman of the Niagara Falls Park Commission.

HAITI, a Republic comprising the western part of the island of Haiti, has an estimated area of 10,204 square miles, and a population variously estimated at from 572,000 to 960,000, but the probability is that the latter figure is more nearly correct. About nine-tenths of the inhabitants are negroes and the rest chiefly mulattoes. The capital is Port-au-Prince, whose population is estimated between 40,000 and 60,000; other cities of importance are Cape Haytien (pop. about 29,000) and Les Cayes (pop. about 25,000). Although primary instruction is free and nearly 1,000,000 gourdes are yearly appropriated for education, the latter is in a very backward condition. Besides five public lyceums and various private schools, there are about 400 schools under government maintenance. The official language of Haiti is French, but the language spoken is a French dialect. Roman Catholicism is the prevailing religion.

Government, etc.—Haiti, formerly a French colony, became independent in 1804. By the constitution adopted in 1867, the chief executive authority is vested in a President, who, according to the Constitution, must be elected by the people; often, however, the choice has been made in some other manner, as by the Senate and House of Representatives, by the army, or by party delegates. The President is assisted by a cabinet administering four departments. General Tiresias Simon Sam was elected President for the term beginning April 1, 1896. His salary is about \$23,300. The legislative power devolves upon a Congress, called the National Assembly, consisting of a Senate and a House of Representatives. The Senators number thirty-nine and are named by the House of Representatives from two lists submitted by the electoral and executive colleges, and they serve for six years. Representatives are chosen for a term of three years by popular vote. The army is nominally composed of 6,828 men. The navy consists of six small vessels ranked as third-class cruisers.

Finance.—The total revenue of Haiti in gold gourdes in 1893 was 7,691,580; in 1895, 7,406,321. The expenditure for the fiscal year 1894-95 was 8,042,705 gourdes, and for the following year, 8,984,539 gourdes. Duties on imports and exports are by far the most important sources of revenue. Import duties have recently been increased about 25 per cent. in order to effect a loan of \$3,500,000, gold, for the purpose of retiring the paper currency and placing the government on a gold basis. In 1898 the business community favored a reciprocity treaty with the United States, but this was impossible, since the revenue is so largely derived from import duties; there is no tax levied on real and landed property. The total external public debt (April 1897) was reported at 13,476,113 gourdes gold; and the internal debt 4,487,105

gourdes gold and 10,812,574 gourdes paper. The gourde, or dollar, is worth (October 1, 1898) \$0.965 United States currency.

Commerce, Industries, etc.—Agriculture is the chief industry, and the principal exports are coffee, cocoa, and logwood. For the fiscal year 1895, these products were exported as follows: Coffee, 75,371,865 lbs.; cocoa, 2,291,548 lbs.; logwood, 138,042,053 lbs. To some extent honey, gum, and cotton are also exported. According to the *Statesman's Year Book*, the coffee exports from Port-au-Prince in 1896 amounted to 6,988,617 lbs.; from Les Cayes, 8,500,000 lbs.; from Gonaives, 6,827,675 lbs.; the export of logwood from Gonaives was 26,410,150 lbs.; from Les Cayes, 11,200,000 lbs.; from Port-au-Prince, 4,929,000 lbs. In 1895 the total exports were said to amount to 13,788,562 gourdes and the imports to 6,232,335 gourdes; in 1896, exports, 9,463,903; imports, 6,053,835. The principal imports are textiles (chiefly cotton) and iron goods. The foreign trade is with the following countries, named in order of importance: United States, France, Germany, Great Britain. Besides logwood, there are many other valuable woods in Haiti, but the exploitation of the forests, as well as all other industries, is impeded by the wretched condition of the roads. There are said to be mines of zinc, copper, and salt.

Railways.—In the summer of 1898 it was announced that a narrow gauged railroad was about to be built from Cape Haytien to La Grande Rivière du Nord, eighteen miles to the northeast. The estimated cost of the road was \$250,000, while the capital stock of the company was \$450,000; a general subscription was invited for 675 shares at \$500 a share, the government making a guarantee of interest at 8 per cent. The government concession to the company is to remain in force for sixty years, and all goods necessary for the construction and maintenance of the road are to be exempt from import tariffs. It is thought that even this short road will prove to be a very considerable aid to agriculture and commerce, as the methods of transportation at present in Haiti are very primitive, the roads being in very poor condition and in the rainy season almost impassable.

Coal Mines.—The following facts relative to the coal mines of southern Haiti are taken from a report of engineer Henri Thomasset: Many traces of coal were found in the valley of Asile and in some places outcrops of 10 centimeters to 120 centimeters in thickness. Samples from these veins upon analysis showed the following composition: water 26.86, ashes 15.35, volatile matters other than water 32.56, fixed carbon 25.23. Other deposits were found along the Serpente River and at Camp-Perrin, the latter place being about 25 kilometers north of Les Cayes. Other veins from 65 to 150 centimeters in thickness were found at the right bank of the Ravine River, and also deposits appeared near the river Bras Gauche. An average sample taken from these veins showed the following composition: water 27.74, ashes 17.22, volatile matters other than water 27.06, fixed carbon 27.98. It is obvious that the analyses given above do not show the presence of excellent coal in that region. The samples, however, were taken from near the surface, and as some taken at greater depth gave much better results, it was thought that at a depth of 15 or 20 metres the coal obtained would prove to be of a very excellent quality. The exploitation of the mines would necessitate the construction of 25 kilometers of railroad into Les Cayes.

HALL, ABRAHAM OAKLEY, ex-Mayor of New York, died in that city October 7, 1898. He was born in Albany, New York, of English parentage, July 26, 1826; was educated in the schools of New York and at the University of the city, being graduated in 1844. He began the study of law, entered the Harvard Law School, where he remained but a short time, and went to New Orleans, continuing his law studies there and devoting some time to newspaper work. In 1846 he was admitted to the Louisiana bar and to the New York bar in 1848. His first party affiliation was with the Whigs; later he joined the Democrats and was three times elected District Attorney of New York, the first being in 1854. He was elected Mayor in 1868 and again in 1870. It was alleged that at this time he was implicated in the notorious "Tweed ring," which he certainly supported, but later he was acquitted of criminal implication in the affair. In 1875 he entered upon a dramatic career, which was of short duration, appearing in his own play, the *Crucible*, at the Park theatre. Later he was in the New York *World* office for a number of years, from 1883 to 1888 was London correspondent of the New York *Herald*, and in 1890 he returned to London for the New York *Journal*. In 1889 Mr. Hall brought suit for libel against Professor James Bryce, because of the chapter on Tammany scandals, written by Professor Goodnow of Columbia University, in Bryce's *The American Commonwealth*. The chapter was omitted in a subsequent edition. The case was dismissed in 1897 because Mr. Hall failed to comply with the court's order directing the plaintiff to give security for the defendant's costs of action. Mr. Hall had a remarkable career as lawyer, politician, and writer.

HALL, JAMES, LL. D., State Geologist of New York, died at Bethlehem, New Hampshire, August 7, 1898. He was born at Hingham, Massachusetts, September

12, 1811; was graduated in 1832 at the Rensselaer School (new Rensselaer Polytechnic Institute), Troy, New York; here for a number of years he conducted the department of geology. In 1837 he was one of the geologists appointed for the survey of New York State, and in the same year became State Geologist and Paleontologist. He was appointed State Geologist of Iowa in 1855 and of Wisconsin in 1857. He assisted in many of the scientific explorations under the United States government; among which were Fremont's expedition in 1845, Stansbury's to Great Salt Lake in 1852, Emory's United States and Mexican boundary survey in 1857, and the United States geological survey of the fortieth parallel in 1877. Dr. Hall published valuable reports on all of these expeditions. He was President of the American Society for the Advancement of Science, in 1856. The following year, at a meeting of the society in Montreal, he advanced the theory of mountain formation by sedimentation below sea level and subsequent elevation; this hypothesis, which he afterward developed, has become an accepted theory. He was said to be the founder of stratigraphic geology and applied paleontology in America, and was the first to show the value of mineralogical composition in determining crystalline rocks. Dr. Hall was one of the original members of the National Academy of Science, and one of the founders of the International Congress of Geology, at the meeting of which at London in 1897 he represented the geologists of New York State. In 1866 he became the director of the New York State Museum and for many years he had in charge the paleontological section of the State Cabinet of Natural History at Albany. His great work, *The Paleontology of New York*, is a standard authority; it consists of fourteen volumes, the first appearing in 1847 and followed at intervals by the others.

HALL, JOHN, D. D., the well-known Presbyterian clergyman of New York, died of heart failure on September 17, 1898, at the home of his sister, Bangor, county Down, Ireland, whither he had gone for rest. He was born at Market Hill, county Armagh, Ireland, July 31, 1829, of Scotch parentage, and at thirteen entered Belfast College, where he was distinguished for scholarship. Having been licensed as a preacher in 1849 by the Presbytery of Belfast, he labored as a missionary for three years in the west of Ireland; he then was installed as pastor of the First Presbyterian Church in Armagh, and six years later as pastor of a large church in Dublin. During his pastorate here the church built a fine new edifice in Rutland Square. At this time Dr. Hall not only was active in church work, but manifested much interest in popular education and other public affairs. He came to America in 1867 as a delegate from the General Assembly of Ireland to the Old School Presbyterian Assembly, and it is thought that the union of these two schools, which occurred soon after, was largely due to his influence. During this visit to the United States he was called to the pastorate of the Fifth Avenue Presbyterian Church, which is said to be the wealthiest in the denomination, and at the head of which he remained until his death. His congregation moved in 1874 to the large edifice at Fifth avenue and Fifty-fifth street. In January 1898, it was reported that there was some dissatisfaction in his congregation, whereupon Dr. Hall tendered his resignation; not being accepted, however, it was withdrawn by him. At the time not a little censure was laid upon the church, a part of which expressed its desire for Dr. Hall's retirement; but it was subsequently stated that this movement was actuated by most generous intentions toward Dr. Hall. Besides serving as a member of the International Sunday School Committee from 1872 to 1896, "he did a vast amount of work on committees and denomination boards, as trustee of Princeton University, director of Union Theological Seminary, lecturer at Yale, chancellor of the University of the City of New York, and in many other responsible positions." ●

According to the consensus of opinion Dr. Hall was neither a great orator nor a deep and original thinker, and yet it is agreed that he was a great preacher. Born in the Calvinistic faith, he never departed from its principles, but always maintained conservatism in belief and a fearlessness in expression. He was outspoken in his opposition to Dr. Briggs and others of that liberal school. Though pastor over a most fashionable parish, he always observed—both in the pulpit and out—a simplicity and directness of manner that were indicative of the man's real greatness and sincerity. The secret of his power doubtless lay in a spirituality and a religious enthusiasm that were both simple and honest. Among his publications are: *Family Prayers for Four Weeks* (1868); *Papers for Home Reading* (1871); *Familiar Talks to Boys*; *Questions of the Day* (1873); *God's Word Through Preaching* (1875); *Foundation Stones for Young Builders* (1880); *A Christian Home and How to Maintain It* (1883); *Light Unto my Path* (1895).

HAMILTON COLLEGE, at Clinton, New York, founded in 1812, is non-sectarian and for men only. On June 1, 1898, there were 37,921 volumes and 20,090 pamphlets in the library. There are forty-five scholarships and one fellowship. For the year 1898-99 the officers of instruction numbered 18; the students numbered: seniors, 46;

juniors, 35; sophomores, 33; freshmen, 42; total, together with one special student and one fellow, 158. At the commencement, June, 1898, the following degrees were conferred: in course, A. B., 26; B. Ph., 6; A. M., 11; A. B., *nunc pro tunc*, 6; A. M., *ex gratia*, 4, by examination, 1; honorary, A. M., 1; Sc. D., 1; D. D., 3; LL. D., 1. The whole number of alumni, including honorary degree men, is 2,887; the classical graduates number 2,257. The Root Hall of Science, given by Mr. Elihu Root and costing \$32,000, was formally opened in November, 1897; the same year the Hall of Languages, given by Mr. Henry H. Benedict, was completed. The latter is a building of the Romanesque style, and cost \$24,600. The total productive funds amount to about \$500,000, and the total income is about \$130,000. President, Melancthon Woolsey Stryker, D. D., LL. D. See UNIVERSITIES AND COLLEGES.

HANDEL AND HAYDN SOCIETY, a choral society founded in Boston, Mass., in 1815, to perform sacred music and introduce the works of Handel, Haydn, and other great composers. The first complete creation performed was *The Messiah* Dec. 25, 1818. Charles E. Horn was the first regularly chosen conductor (1847). He was succeeded by Charles C. Perkins, J. E. Goodson, G. J. Webb, Carl Bergmann, Carl Zerrahn, and Reinhold L. Hermann, the last-named in 1898.

HANDY, Major MOSES PURNELL, prominent American journalist died in Augusta, Georgia, January 8, 1898. Son of a Presbyterian missionary, he was born in Missouri in 1847, but was brought up and educated in Virginia. During the Civil War he served in the Confederate army on the staff of General Stevens, as a special courier, having the rank of lieutenant. He began his career as a newspaper writer with a series of articles describing his military experience, which appeared in the *New York Watchman*. In 1870 he received severe injuries in the collapse of the Virginia State capitol in Richmond. Previous to that time Major Handy wrote for the *New York Christian Observer* and the *Richmond Despatch*. As correspondent for the *New York Tribune* he went to Cuba in 1873, whence he reported the *Virginian* affair, and, returning to this country, he became editor-in-chief of the *Richmond Enquirer*. Having acted as commissioner from Virginia to the Centennial Exposition at Philadelphia in 1876, he secured successively positions as editorial writer on the *Times*, managing editor of the *Press*, and editor and proprietor of the *Daily News*. He won a great reputation in 1893 as director of the Department of Publicity and Promotion of the Columbian Exposition. He was managing editor of the *Chicago Times-Herald* during the presidential campaign of 1896. On July 27, 1897, President McKinley appointed Major Handy to the position of Special Commissioner of the United States to the Paris Exposition of 1900, in which office, he was succeeded by Mr. Ferdinand W. Peck (q. v.).

HARCOURT, Sir WILLIAM VERNON, British statesman, regarded after the death of Gladstone as the natural leader of the Liberals, resigned the leadership of that party in December, 1898. He was born on October 14, 1827; educated at Cambridge University and called to the bar at the Inner Temple. In 1868 he was returned to the House of Commons as a Liberal for the city of Oxford. He was elected professor of International Law in Cambridge University in 1869 and appointed Solicitor General in 1873, holding this office until the resignation of the Gladstone Cabinet in February of the following year. In 1880, when Mr. Gladstone returned to power, Sir William Harcourt was made Secretary of State for the Home Department and went out of office with his party in June 1885. In January 1886 he was again made Chancellor of the Exchequer, which office he assumed for the third time in August 1892, holding it until the fall of the Gladstone-Rosebery government in June 1895. In a letter in which he said he could not undertake in future the responsibility of the Liberal leadership he referred to the sectional disputes which divided the party and said that no man could consent to do so, either with credit to himself or advantage to the country. He felt that there was a lack of unanimity in the desire for his leadership. His resignation gave the Liberals much concern and the complications which followed it greatly encouraged their political enemies. The question of Liberal leadership was unsolved at the close of the year 1898. See the article GREAT BRITAIN (paragraphs on History).

HARDEN, WILLIAM DEARING, jurist and author, died at Savannah, Georgia, January 10, 1898. He was born at Athens, Georgia, January 15, 1837; was graduated at Princeton in 1856; studied law and upon the outbreak of the Civil War entered the Confederate service. He served throughout the war in Tennessee and Virginia, being advanced to the rank of lieutenant-colonel. After the war he practised law in Savannah and was Judge of the City Court for fourteen years. Judge Harden was also well known in New York law circles and was a member of many well-known societies and clubs. He was the author of a work on dogmatic religion and of many papers on historical subjects. In politics he was a "gold" Democrat.

HARDEN-HICKEY, Baron, known as the "Prince of Trinidad," committed suicide at El Paso, Texas, February 9, 1898. He was born in France, December

8, 1854, gained some reputation as an author and journalist, and from 1878 to 1888 edited the *Paris Triboulet*, a journal devoted to the cause of the Royalists. During the nine years that he held this position, he fought several duels, was involved in forty-two lawsuits, and incurred fines aggregating 300,000 francs. While on a trip around the world his ship ran ashore on the island of Trinidad, off the Brazilian coast. Here he remained, and in 1894 proclaimed himself king with the title of "James I." He obtained colonists, made laws, issued currency and postage stamps, and provided for the carrying of mails by establishing a navy of one vessel. In 1895 Great Britain seized the island, and thus ended his rule. The act, however, caused a diplomatic dispute between the British and Brazilian governments.

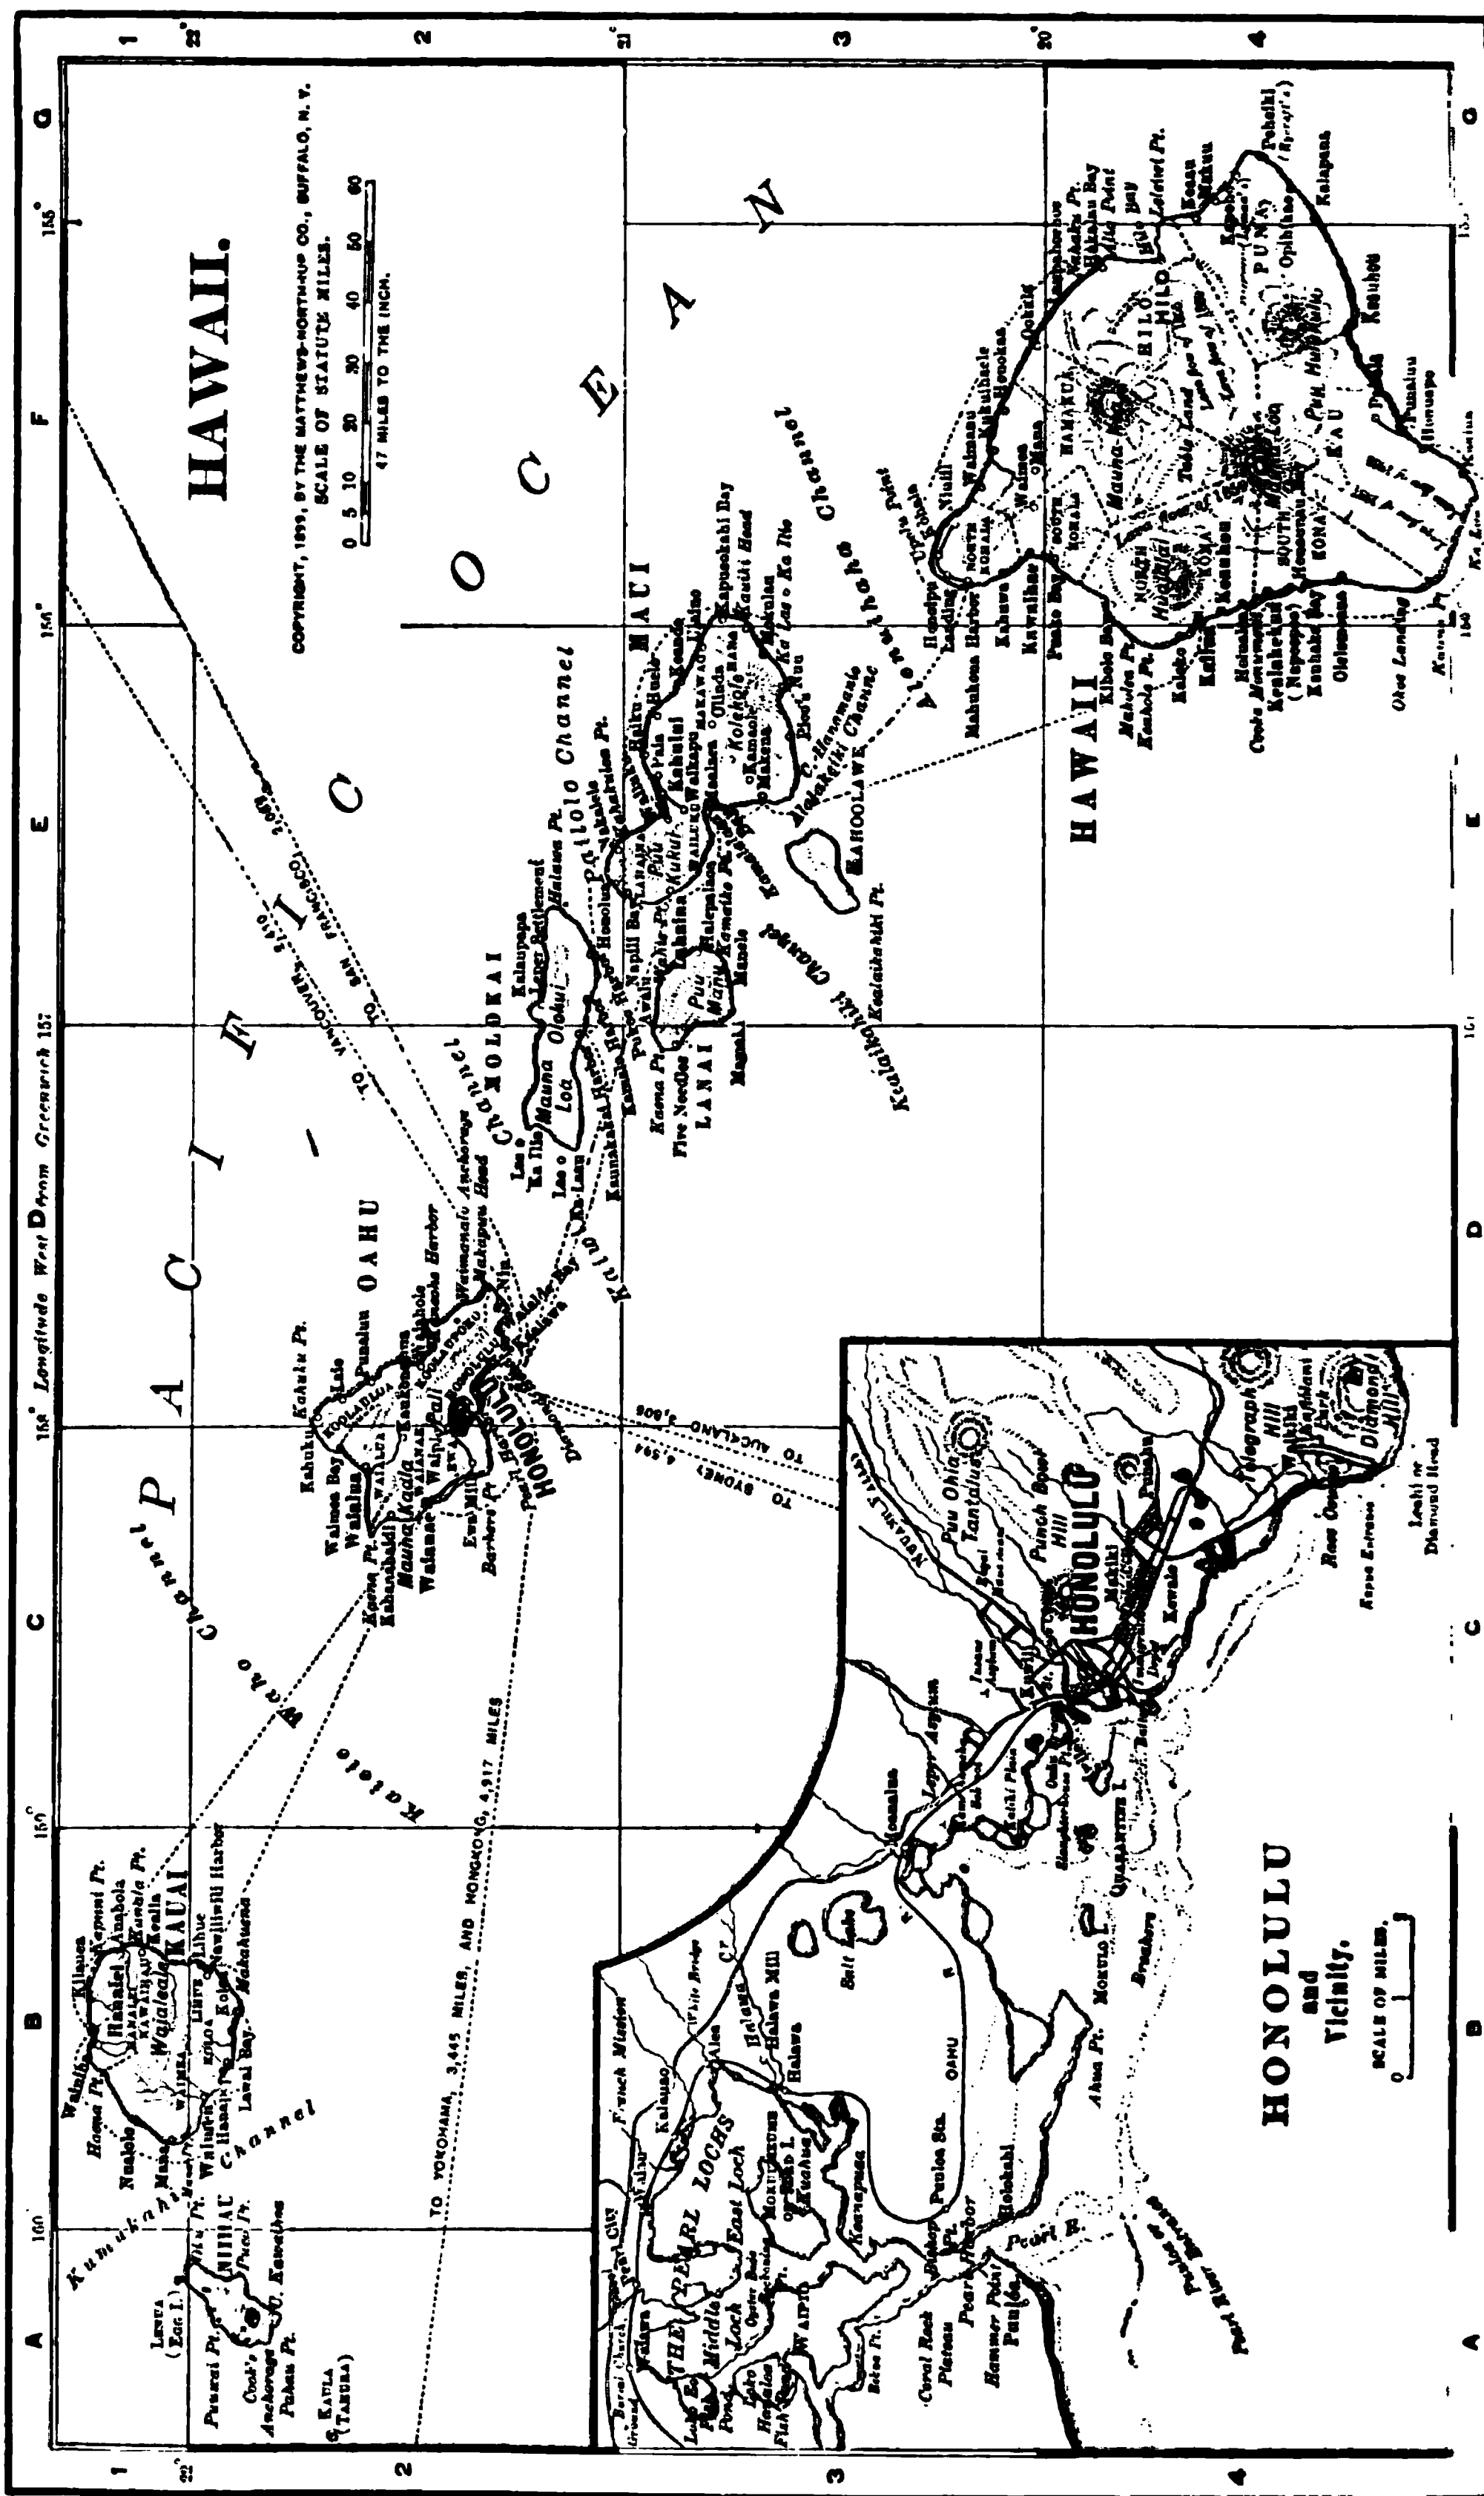

HART, ERNEST, D. C. L., M. R. C. S., was born in June 1836, and died January 7, 1898. He was educated at the City of London School and the medical school connected with St. George's Hospital; became ophthalmic surgeon and lecturer on ophthalmology at St. Mary's Hospital; was dean of the medical school, and for several years was co-editor of the *Lancet*. He did much to expose the unsanitary condition of the workhouses and was instrumental in bringing about the passage of "Hardy's Act" and the establishment of the Metropolitan Asylums Board. His reports on criminal baby farming in 1868 resulted in the Infant Life Protection Act; and later (1876) he assisted in establishing coffee taverns in London. From 1866 to the time of his death he was editor of the *British Medical Journal*. He was the author of numerous publications dealing largely with matters of workhouse sanitation, public health, etc. He also wrote *The Ancient Arts and Artists of Japan*. Mrs. Alice Marian Hart, widow of Dr. Hart, is a well-known English philanthropist.

HARVARD UNIVERSITY, at Cambridge, Massachusetts, non-sectarian; co-educational only in the summer schools; founded in 1836; comprehends the following departments to each of which is given the number of students for the academic year 1898-99: Harvard College, 1851; Lawrence Scientific School, 415; graduate school, 322; Divinity School, 26; Law School, 551; Medical School, 560; Dental School, 139; School of Veterinary Medicine, 25; Bussey Institution (school of agriculture), 23; total, deducting names inserted more than once, 3,901; the summer school of 1898 had an attendance of 759, making a total enrollment of the University 4,660. Officers of instruction number 411; President, since 1869, Charles William Eliot, LL. D. The degrees conferred at the commencement of 1898 were as follows: A. B., 391, out of course, 15; S. B., 29, out of course, 10; A. M., 102, out of course, 5; S. M., 5; Ph. D., 26; S. T. B., 3; LL. B., 130, out of course, 8; M. D., 124, out of course, 1; D. M. D., 36; M. D. V., 10; honorary, A. M., 3; D. D., 2; LL. D., 3. The libraries contain about 524,700 bound volumes together with about the same number of pamphlets, maps, etc. The Hemenway Gymnasium, with a floor space of about 30,000 square feet, is most excellently equipped, having lockers, dressing rooms, etc., for the accommodation of 2,500 students.

RADCLIFFE COLLEGE, at Cambridge, non-sectarian and for women only, was organized in 1879, as the Society for the Collegiate Instruction of Women ("Harvard Annex"), and was subsequently chartered under its present name. Students are instructed by members of the faculty of Harvard University; degrees are conferred with the approval of the president and fellows of Harvard College. The library contains 12,000 volumes, while the students are at liberty to use the Harvard library. For the academic year 1898-99, the officers of instruction numbered 96 and the students 411. The requirements for the degrees of Master of Arts and Bachelor of Arts are the same as for the corresponding degrees in Harvard University; the diplomas are countersigned by the President of Harvard and bear the University seal. See **PSYCHOLOGY, EXPERIMENTAL,** and **UNIVERSITIES AND COLLEGES.**

HASHISH. See **PSYCHOLOGY, EXPERIMENTAL** (paragraph Brown University).

HASKELL, JOSEPH T., Brigadier-General, U. S. V., died at Columbus, Ohio, September 16, 1898. He was born in Cincinnati, November 19, 1838. He entered the Union service and in 1863 was appointed a captain of volunteers and commissary of subsistence; he served through the war and was brevetted major, lieutenant-colonel, and colonel for meritorious services; was mustered out in 1866 and appointed a captain in the Twenty-third Infantry. In June 1872, he became major of the Twenty-fourth, and in August 1896, lieutenant-colonel of the Seventeenth. In 1869-72 he was in command in the San Juan islands, in regard to which there was a dispute between England and the United States. In 1888 he was made a member of the tactics board and assisted in compiling the tactics now used in the army; he was said to be one of the best tacticians in the service. From 1891 to 1898 he was president of the board of examiners of officers for promotion. At the outbreak of the war with Spain, when John S. Poland, colonel of the Seventeenth, was made a brigadier-general, Lieutenant-Colonel Haskell assumed command of the regiment and led it in the attack on El Caney July 1, 1898. He was seriously wounded and was carried from the field and sent to Fortress Monroe. On September 7 he was promoted

brigadier-general for gallantry. He died suddenly after riding at the head of the Seventeenth when that regiment marched through Columbus.

HAVELOCK-ALLAN, Sir HENRY MARSHMAN, V. C., K. C. B., English general and Member of Parliament, was killed by the Afridis near the Khyber Pass on the Afghan frontier, December 30, 1897. He was the son of General Sir Henry Havelock, of Indian Mutiny fame, upon whom a baronetcy was conferred, but as he died before receiving it, the title was granted to the son. The addition of the name of Allan was due to the fact that a relative left him a legacy with that condition attached. He was born at Chinsurah, Bengal, India, August 6, 1830. On March 31, 1846, he obtained his commission as an ensign; in 1857 he served in the Persian expedition and as aide-de-camp to his father against the rebels in Oude. He was at Lucknow and Cawnpore and at the latter place won the Victoria Cross and was promoted to a captaincy. He soon became major and went under Lugard to put an end to the troubles in the Azimurh district. This was in October; in November he was ordered to take part in the Trans-Gogra campaign. At the end of the war in April 1859, he had been mentioned ten times in the despatches, had won a medal and two clasps, and had been promoted to the rank of brevet lieutenant-colonel. He fought in the Maori War, New Zealand, 1863-65. He was a Member of Parliament for Sunderland, 1874-81, and for Durham, 1885-92. He retired from military life in 1887, but in 1897 received the honorary rank of lieutenant-general, and was made K. C. B.

HAWAII, or **SANDWICH ISLANDS**, a chain of islands in the middle of the Pacific Ocean with an area of 6,640 sq. m. and a population according to the census completed in 1897 of 109,020, of which the most numerous element was the Hawaiian numbering 31,019. The Americans numbered 3,086. The capital is Honolulu (pop. 29,920) on the island of Oahu. The soil is very fertile and the chief products are sugar and rice, but coffee, hides, wool, bananas, whale oil and bone are also produced and exported in considerable quantities.

Commerce and Communications.—Steamers ply between the islands and the American continent, Australasia and China. There is a telegraph system comprising about 250 miles and a railway system of about 71 miles. In 1898 the total exports from the Hawaiian islands to all other countries were \$17,208,825 and the total imports were \$10,368,815. According to the Hawaiian official figures each of these totals is greater than was ever before reached in the foreign trade of the country. By far the largest share of this trade is with the United States. Of the exports from Hawaii in 1898 the United States received 99.44 per cent. and of the total imports to Hawaii the United States contributed 75.97 per cent.

Finance.—In 1896 the taxes collected amounted to \$706,541, the tax per capita being \$6.48. For the year ending December 31, 1896, the revenue was \$2,383,070 and the expenditure \$2,137,103. The debt of the islands on June 30, 1896, was \$4,119,174.

Education.—The Hawaiian Islands out of a population of 109,000 have a school population between the ages of 6 and 15 inclusive, of 7,694 males and 6,592 females, a total of 14,286, about one-third of whom are Hawaiian and not quite a third are Hawaiian born, but of foreign parentage, Japanese, Chinese, Americans, British, German and Norwegian making up the greater part of the balance. There were in 1896 among the 595 teachers in the Hawaiian schools 177 American, 128 Hawaiian and part Hawaiian, and 66 British teachers, and the attendance upon the schools was: government schools 9,093 and independent or private schools 3,464. By the school law of 1896 the supervision of education is placed in the hands of the secretary of foreign affairs as head under him being six commissioners appointed by the President, the clergy of any denomination being excluded from appointment to this board. Attendance at some school is made obligatory for all children from 6 to 15 years of age. Private and independent schools are inspected by the government and instruction must be in the English language except by special permission. Co-education is legalized. The percentage of those above 6 years able to read and write was nearly 64, a very high figure when compared with most of the other nationalities of the world.

The Newlands Resolutions.—When Congress met in December, 1897, the Annexationists expected that the treaty providing for the annexation of Hawaii to the United States, which had been transmitted to the Congress by the President and had been ratified by the Congress of Hawaii, would quickly receive the required two-thirds vote in each house. They were, however, disappointed, for the debate continued until the latter part of March the annexation party seemingly losing strength. It was now seen that annexation could be made possible only by joint resolution. The attention of Congress was then transferred to the difficulties with Spain, and annexation was well-nigh a dead issue until the victory of Commodore Dewey at Manila brought more clearly to light American interests in the Pacific. On June 15, 1898, the Newlands Resolutions providing for annexation were adopted by the House by a vote of 209 to 91, and by the Senate, July 6, by a vote of 42 to 21. The vote by

parties in the House was: Affirmative, 179 Republicans, 18 Democrats, 8 Populists, and 4 Fusionists. In the Senate six Democrats voted in the affirmative and two Republicans in the negative. The following is a summary of the resolutions adopted: The preamble states the offer of the Hawaiian Republic to cede to the United States all of its sovereignty and absolute title to the government and crown lands. The offer is accepted and the islands declared annexed. The resolutions provided that the public debt of Hawaii, not to exceed \$4,000,000, be assumed, that Chinese immigration be prohibited, that all treaties with other powers be declared null, and that, until the Congress of the United States should provide for the government of the islands, all civil, judicial, and military powers then exercised by the officers of the existing government be exercised in such manner as the President might direct. It was further provided that the President appoint a committee of five, at least two of whom were to be resident Hawaiians, to recommend to Congress such legislation as might be deemed advisable. President McKinley, by whom the resolutions as well as the previously proposed treaty were warmly approved, signed the joint resolutions July 7, and the next day appointed the following committee: Senator Shelby M. Cullom, of Illinois; Senator John T. Morgan, of Alabama; Representative Robert R. Hitt, of Illinois; President Sanford B. Dole, of Hawaii; Justice W. F. Frear, of the Hawaiian Supreme Court.

Arguments on Annexation.—The more conservative element in the country objected to annexation at this time by joint resolution, first, because they held that a time of war is not favorable for giving a dispassionate and intelligent consideration to such a question; and, secondly, because they questioned the constitutionality of the measure declaring that annexation by joint resolution, without the conferring of statehood, was without precedent in the United States. The Congressional debates on the question were of a high order. The following is a brief statement of the annexationists' chief arguments. American influence was paramount in Hawaii, and by reason of this the government protected and fostered the people in industrial, social, and Christian enterprises; without annexation, however, this could not continue, because by the silent invasion of Asiatics the people would relapse into barbarism and even the confiscation of American property might result. Hawaii is a central point for telegraphic cables in the North Pacific and is of great strategic and commercial importance, it being asserted that with it we could defend our coast with a smaller navy. In reply to the question of constitutionality it was claimed that, if Congress has the right to appropriate money for the purchase of new territory, it has the right to accept new territory as a gift. Up to the time that Commodore Dewey shifted the interest in the war to the Philippines, little consideration had been given to the proposed annexation as a war measure, although Captain Mahan long before had pointed out the very great strategic importance of the islands. When it became necessary to send supplies and other reinforcements to Commodore Dewey, the Hawaiian government, in violation of the international laws of neutrality, permitted American ships to coal at Honolulu and to make that city a base of war and naval supplies. It has been claimed by some that had Hawaii maintained neutrality, the United States, in order properly and successfully to follow up Dewey's victory, would have been obliged to take Honolulu by force. An immediate appeal of Hawaii to all the nations of the world would have ensued and foreign complications resulting, the United States would have lost both the advantages already gained and the possibility of further success in the Pacific. The strategic advantage in this specific case and the great friendliness of Hawaii to our government, led to a change in public opinion, so that at the time of annexation, Congress had the support of a large majority of the people. Whether annexation will prove to have been a wise measure or not, it is fortunate that it was finally decided by a consideration of that phase of the question which was of real merit and significance. Previously the debate had been largely upon the "sugar question." Each side claimed that relations of undue friendliness existed between its opponents and the Sugar Trust. Those opposed to annexation said that the Trust favored it because it promised the continuation of a large supply of untaxed raw sugar; those who were in favor of annexation said that the Trust opposed it because some Hawaiian sugar could be consumed without going to the refineries, and that the admission at that time of raw sugar free of duty was agreeable to the trust, while the proposed admission of partly refined sugar free of duty would injure it. Still further opposition arose from the beet-sugar industry, which has been recently fostered in this country. It was claimed that annexation, bringing with it free Hawaiian sugar, would tend to destroy the beet-sugar interests. Hawaiian sugar for a number of years had been admitted free, and so it was proposed not only to defeat annexation, but to repeal the reciprocity treaty and thus gain a revenue of nearly \$8,000,000 a year. The entire sugar discussion was lost in the larger economic problem, and it is improbable that the Sugar Trust influenced many votes either one way or the other. The opponents of annexation said that it was unwise to divide our territory, to inaugurate in this country the principle of territorial expansion, or to admit a new territory "whose citizenship is so undesirable that it

THE HARBOR OF HONOLULU.
